A full range of treatment...

As an Air Force physician, you may practice your specialty in modern, well-equipped facilities with a complete support staff.

In addition to the wide spectrum of clinical experience you'll gain, you'll have administrative support to alleviate most of the clerical workload. The type of medicine you will practice is based on the needs of your patients, regardless of their financial status.

For yourself and your family, Air Force medicine will provide reasonable working hours, excellent pay, 30 days of paid vacation each year, and many other benefits.

Consider the Air Force Medical Corps – a reasonable alternative for today's physicians.

Air Force. A great way of life.**

"THE PHYSICIAN IS A DECISION MAKER, AND ALMOST EVERY DECISION HE MAKES COSTS OR SAVES MONEY."

—Dr. William Felts, Past President,
American Society of Internal Medicine

More and more physicians today are beginning to realize the extent of the economic influence they have, and are finding ways of holding costs down.

A number of studies show that the more physicians *know* about costs, the more they try to *reduce* them.* And this reduction can be done without reducing the quality of care to the patient.

How are they doing this? As a start they have become thoroughly familiar with the costs they incur on behalf of their patients. They know how much an X-ray costs, how much their hospital charges for routine lab tests. They're requesting copies of patients' hospital bills. And asking their hospitals to print the charges for diagnostic tests right on the order sheet.

What else are physicians doing? Minimizing their patients' hospital stays, whenever possible. Reevaluating routine admissions procedures. Questioning the real need of the diagnostic tests they order for their patients. Avoiding duplicate testing. Trying to discourage their patients' demands for unnecessary medication, treatment or hospitalization. Compiling daily logs of their medical decisions and what they cost. And more.

More physicians today realize what a tough problem we're all faced with. They know this is a challenge for medicine. And that physicians are in the best position to deal with and solve the problem.

to relieve psychic tension
and its functional symptoms

VALIUM®
(diazepam) 

2-mg, 5-mg, 10-mg scored tablets

VALIUM® (diazepam)

Before prescribing, please consult complete product information, a summary of which follows:

Indications: Tension and anxiety states, somatic complaints which are concomitants of emotional factors; psychoneurotic states manifested by tension, anxiety, apprehension, fatigue, depressive symptoms or agitation, symptomatic relief of acute agitation, tremor, delirium tremens and hallucinosis due to acute alcohol withdrawal, adjunctively in skeletal muscle spasm due to reflex spasm to local pathology; spasticity caused by upper motor neuron disorders; ataxosis, stiff-man syndrome, convulsive disorders (not for sole therapy).

The effectiveness of Valium in long-term use, that is, more than 4 months, has not been assessed by systematic clinical studies. The physician should periodically reassess the usefulness of the drug for the individual patient.

Contraindicated: Known hypersensitivity to the drug. Children under 6 months of age. Acute narrow angle glaucoma, may be used in patients with open angle glaucoma who are receiving appropriate therapy.

Warnings: Not of value in psychotic patients. Caution against hazardous occupations requiring complete mental alertness. When used adjunctively in convulsive disorders, possibility of increase in frequency and/or severity of grand mal seizures may require increased dosage of standard anticonvulsant medication, abrupt withdrawal may be associated with temporary increase in frequency and/or severity of seizures. Advise against simultaneous ingestion of alcohol and other CNS depressants. Withdrawal symptoms (similar to those with barbiturates and alcohol) have occurred following abrupt discontinuance (convulsions, tremor, abdominal and muscle cramps, vomiting and sweating). Keep addiction-prone individuals under careful surveillance because of their predisposition to habituation and dependence.

Usage in Pregnancy: Use of minor tranquilizers during first trimester should almost always be avoided because of increased risk of congenital malformations as suggested in several studies. Consider possibility of pregnancy when instituting therapy; advise patients to discuss therapy if they intend to or do become pregnant.

Precautions: If combined with other psychotropics or anticonvulsants, consider carefully pharmacology of agents employed; drugs such as phenothiazines, narcotics, barbiturates, MAO inhibitors and other antidepressants may potentiate its action. Usual precautions indicated in patients severely depressed, or with latent depression, or with suicidal tendencies. Observe usual precautions in impaired renal or hepatic function. Limit dosage to smallest effective amount in elderly and debilitated to preclude ataxia or over-sedation.

Side Effects: Drowsiness, confusion, diplopia,

hypotension, changes in libido, nausea, fatigue, depression, dysarthria, jaundice, skin rash, ataxia, constipation, headache, incontinence, changes in salivation, slurred speech, tremor, vertigo, urinary retention, blurred vision. Paradoxical reactions such as acute hyperexcited states, anxiety, hallucinations, increased muscle spasticity, insomnia, rage, sleep disturbances, stimulation have been reported, should these occur, discontinue drug. Isolated reports of neutropenia, jaundice, periodic blood counts and liver function tests advisable during long-term therapy.

Nutley, New Jersey 07110

NOW effective June 1 **MONEY MARKET CERTIFICATES**

**yield 1/4% more than the average
rate on 6 month U.S. Treasury Bills**

Money Market Certificates from Arlington Federal are similar to a 6-month Treasury Bill except they pay 1/4% more than the average discount rate in the most recent weekly auction on 6-month Treasury Bills. For example, if the last Treasury Bill auction in May results in an average yield of 7.16%, our Money Market Certificate available on June 1 would have a rate of 7.41% per annum. These Certificates will be issued in minimum denominations of \$10,000, with a 6-month (26-week) maturity. There is a substantial penalty for early withdrawal.

**also 8% SAVING
CERTIFICATES**
(effective annual yield 8.33%)

You can invest in these Saving Certificates in minimum denominations of \$1,000 and receive an 8% dividend compounded annually to 8.33%. The Certificates mature in 8 years. For investors who wish a long-term, high-yield Certificate insured up to \$40,000 by the Federal Savings and Loan Corporation, this is an unusual opportunity. There is a substantial penalty for early withdrawal. Stop in at any one of our convenient offices and ask about these new Certificates that are being offered for the first time on June 1.

At Manor Care we have you in mind, too.

When Manor Care coordinates medical services, we keep the physician as well as the patient in mind.

All seven of our Maryland centers offer:

- * A Registered Physical Therapist to carry out any therapy orders you prescribe.

- * A food service manager consulting with a Registered Dietician to provide any special diets your patient needs.

- * A unit dose medication system to ensure the freshness and accuracy of your prescriptions.

- * Extensive in-service education programs to keep the nursing staff up-to-date on new concepts and to review basic geriatric practices.

7% of the population may be harboring latent or dormant tuberculosis*

Are you testing for it during
routine office physicals?

*Based on a national estimate of 15 million tuberculin reactors
Stead, W.W. and Bates, J., in Harrison's Principles of Medicine,
8th Edition, 1977, McGraw-Hill, p. 900

✓ LEDERLE Tuberculin, Old

TINE TEST®

An important check in every checkup.

A system, not just a test — supplied with patented induration indicator cards in English or Spanish — simplifies recording and record keeping.

- Over 15 years of use — millions of tests performed each year.
- Practical and easy to perform — presterilized; disposable; no refrigeration needed; no needles or syringes.
- Fast — only seconds to perform — can be read in 48-72 hours.

Precautions: Tuberculin testing should be done with caution in persons with active tuberculosis. However, activation of quiescent lesions is rare.

Although clinical allergy to acacia is very rare, this product contains some acacia as a stabilizer and should be used with caution in patients with known allergy to this component. Reactivity to the test may be suppressed in patients who are receiving corticosteroids or immunosuppressive agents, or those who have recently been vaccinated with live virus vaccine such as measles.

With a positive reaction, further diagnostic procedures must be considered. These may include x-ray of the chest, microbiologic examinations of sputa and other

specimens, and confirmation of the positive TINE TEST using the Mantoux method. In general, the TINE TEST does not need to be repeated. Antituberculous chemotherapy should not be instituted solely on the basis of a single positive TINE TEST.

Adverse Reactions: Vesiculation, ulceration, or necrosis may occur at the test site in highly sensitive persons. Pain, pruritus and discomfort at the test site may be relieved by cold packs or by a topical glucocorticoid ointment or cream. Transient bleeding may be observed at a puncture site and is of no significance.

NINTH ANNUAL BOARD REVIEW AND REFRESHER COURSE

INTERNAL MEDICINE 1979

Sponsored By:

The Department of Medicine, Maryland General Hospital
and
The Department of Medicine, University of Maryland
School of Medicine

Time: February 7 through June 20, 1979, 5:30-7:30 PM
20 consecutive Wednesday evenings

Place: Maryland General Hospital Auditorium
827 Linden Avenue
Baltimore, Maryland 21201

Fee: Practicing Physicians \$95
House Staff \$50
(includes tuition, outlines, binder, snacks)

The course is designed to aid the physician preparing for the Certifying Examination in Internal Medicine and to be of value to the practicing physician. 40 hours credit for relicensure, Maryland State Board of Medical Examiners and AMA Physicians Recognition Award, Category 1.

Renal Tubular Acidosis

By LEE A. GOODMAN, MD

Dr. Goodman is Assistant Professor at the University of Maryland Hospital, 22 S. Greene St., Balto., MD 21201.

Case History

This 16-year-old female has been followed for several years for a metabolic problem. She first presented with evidence of poor physical growth as well as easy fatigability. She has also experienced bouts of intermittent renal colic. Laboratory evaluation revealed a metabolic acidosis. An abdominal film was obtained (Figure 1). Following that, an intravenous pyelogram was performed. Figure 2 is the nephrographic tomogram obtained early in the IVP, and Figure 3 is a later excretory film.

1. What is your prime diagnosis? Differential diagnosis?

2. What metabolic abnormalities might be expected?

Answer on next page.

Radiological Case of the Month.

Case history on preceding page.

Discussion

The plain film of the abdomen reveals multiple small, punctate calcifications overlying the kidneys. The renal location of these calcifications is confirmed on the IVP. A further note is the fact that the calcifications are clumped within the medullary portion of the kidneys and, more specifically, in the distribution of the renal papillae—they are not within the collecting systems. If they were within the collecting system (calyces), then the contrast material on the IVP would be expected to obscure the calculi.

Calcification within the kidneys can be classified according to the location of the calcific deposits. Calculi within the collecting systems, referred to as nephrolithiasis, is by far the most common; 85% of calculi within the calyces or ureters are radiodense; that is, they are visible on plain films. Calcification in the kidney can also be situated in the renal parenchyma. This second category is referred to as nephrocalcinosis and can then be subdivided into cortical calcifications and medullary calcifications. Cortical nephrocalcinosis, by far the rarest, can be caused by chronic glomerulonephritis, acute cortical necrosis and several other very unusual entities. Medullary nephrocalcinosis, on the other hand, is not as rare. The present case exhibits this medullary or papillary form.

The differential diagnosis of medullary nephrocalcinosis includes renal tubular acidosis, medullary sponge kidney, hyperoxaluria and multiple entities causing hypercalcemia as well as hypercalcuria. These include primary hyperparathyroidism, metastatic carcinoma to the bone, sarcoidosis, milk-alkali syndrome and hypervitaminosis D. As noted, these calcifications occur in the renal papilla in the area of the distal tubule. It is at this site that the greatest concentrations of ions are achieved. Very often, the many causes of medullary nephrocalcinosis are difficult to differentiate radiographically.

In this case, the patient had a long history of a metabolic acidosis and carried a diagnosis of renal tubular acidosis (RTA). This disease has been defined, in its simplest terms, as an inability of the kidney to make urine with a pH of less than 5.4. More specifically, the distal nephron is unable to secrete hydrogen ion (H^+) against a gradient. As the patient becomes more acidotic, there is a fall in the blood pH and plasma bicarbonate level as well as an increase in plasma chloride. The resultant alkaline urine favors calcium precipitation and stone formation in the renal papillae and in the calyces. The specific tubular defect in RTA has been subdivided into "proximal" (not associated with nephrocalcinosis) and "distal" (commonly associated with nephrocalcinosis). The distal form can be further categorized into "complete," as in this case, or "incomplete," where the electrolytes are normal.

Clinically, the syndrome is often idiopathic and can be either transient or persistent. It can affect patients ranging in age from infants to the very elderly. It has also been described in association with many other

disorders (secondary RTA) such as Fanconi syndrome and several of the hyperglobulinemic states including multiple myeloma. The full-blown clinical picture of renal tubular acidosis includes symptoms secondary to urolithiasis, muscle weakness or paralysis, cardiac arrhythmias, osteomalacia, growth retardation, polyuria and even overt renal failure. Treatment is basically geared to correcting the metabolic abnormalities.

Radiographically, the most common presentation is a diffuse medullary form of nephrocalcinosis. The IVP will not, however, reveal any evidence of cystic dilatation of the distal tubules as might be seen with medullary sponge kidney. This is occasionally helpful in distinguishing these two entities. Patients with RTA can also develop prominent stones within the calyces and ureters. The radiographic signs of osteomalacia including generalized osteopenia, skeletal deformities and pseudofractures are occasionally seen.

There is a Lab/Work area, storage room, private consultation room, business office and waiting room.

Must be seen to be appreciated for its design.

Call Dr. Schreiber at (301) 252-0111.

Accept no substitute for your professional judgment

As a physician, you have the right to prescribe the drug which you believe will most benefit your patients. Now, substitution laws make it more difficult to exercise that right. In many states, unless you specifically direct pharmacists to dispense your brand-name prescription as written, they may be required by law to substitute another drug for your brand-name prescription.

This means that the ultimate drug selection is no longer yours; its source is left to the pharmacist's discretion. You will have forfeited your right to prescribe as you see fit. Preserve your rights. Specify that you will accept no substitution.

When you accept no substitutes...

- You ensure that your patient receives exactly that product you have specified on your prescription
- You choose the quality of the product dispensed to your patient
- You can exercise the right to select a product based upon its proven therapeutic performance and to select a manufacturer that stands behind its brand name or generic product
- You can support the kinds of research programs that are vital to new drug discovery and development
- You can help sustain important physician, pharmacist and patient education services supported by innovative, research-oriented firms

For complete information on the drug substitution law effective in your state, please consult your local Pfizer Representative.

"Much-Deserved Recognition"

To the Editor:

I have been an avid follower of the series of articles on the history of medicine, *Health in History* . . . and have just noted the much-deserved recognition . . . received, as reported in the July, 1978 issue of the *Journal*. I read the *Journal* whenever I can at the local medical library. I graduated from Hopkins in 1962, and recall many pleasant visits to the Med-Chi Library while a student in Baltimore . . .

EDWARD H. STEIN, MD

PHYSICIAN PLACEMENT SERVICE

The Medical and Chirurgical Faculty of the State of Maryland maintains a Placement Service for the convenience of Maryland physicians, hospitals and communities in search of candidates for positions available in our state. A detailed description of such opportunities should be forwarded to the Physician Placement Service, 1211 Cathedral St., Baltimore, MD 21201; telephone 1-301-539-0872.

Physicians wishing to locate in Maryland are invited to submit a resume to be kept on file with the Physician Placement Service. Candidates are requested to inform the Faculty when they are no longer available for consideration for opportunities which might be available in Maryland.

Journal announcements on the Classified Advertising page for Physician Placement Service are charged at the regular Classified Advertising rate.

HARRY HUGHES BEING INTERVIEWED BY THE JOURNAL, Sept. 18, 1978. (Photography by Claude Brooks, Owings Mills, MD.)

ON YOUR HORIZON LIES Nautilus Virgin Charters ...

....Where you'll cruise with the finest bareboat fleet in the Caribbean. Our factory-fresh Morgan Out Island yachts feature dramatic 1978 innovations. Join the 28,000 sailors who chartered a Morgan last year, and do yourself the special favor of trying the all-new NVC fleet, offering thoughtful custom features designed with your cruising comfort in mind.

Our St. Thomas location insures a scenic sail and anchorage on the day of your arrival, with excellent jet service and only a 25 minute courtesy drive from the airport. No island hopping, luggage chasing, or hotel bills. You can provision your charter from U.S.-style markets en-route to our marina, or utilize our flexible service ranging from split provisioning to full menus featuring island delicacies (and an extensive wine and spirits list).

Our marina and staff are dedicated exclusively to your charter needs. The on-site manager, Rick Rickard, is NVC's president, working full time to make your sailing vacation a success. He'll help plan your cruising itinerary to include secluded harbors or resort areas, and arrange an instructor if you desire.

We offer these incomparable Morgans:

01 41, ketch rigged, redesigned by NVC to sleep 8 with tri-cabin privacy and 2 heads.

01 33 sloop, incredibly spacious for 2 couples or a family of 6 - at family rates.

MORGAN 45, Queen of the NVC fleet, with captain and provisioning all inclusive, for the most memorable vacation imaginable. (Limited availability, call early.)

Weekly rates as low
as \$100/person.

Executive Director's Newsletter

January, 1979

PRESCRIPTION

BLANKS

The Faculty office has been alerted by the Division of Drug Control that some physicians are leaving both signed and unsigned Medical Assistance Prescription forms in pharmacies. In some instances, it has been found that the drug issued is not the drug ordered by the physician. Physicians are advised, once more, that this practice is illegal and violators are very likely to be prosecuted. The Committee on Drugs strongly emphasizes that the practice of leaving prescriptions in pharmacies (whether Medicaid or not) is not only bad medical practice, but illegal and cannot be condoned.

LEGISLATIVE

HOTLINE

The 1979 session of the Maryland General Assembly convenes on Wednesday, January 10, 1979. The 90-day session ends at midnight, Monday, April 9, 1979. During the session, Faculty members will be kept up-to-date on legislative activities through The Assemblyman newsletter and the legislative HOTLINE. The HOTLINE number for 1979 is the same as last year:

1-800-492-9373.

1979 DUES

BILLS

1979 Dues bills are in the mail to all members. Dues must be paid by January 31, 1979, in order to be eligible for panels for physicians' defense. If your bill has not been received, please contact the Faculty Accounting Department, 539-0872.

RESOLUTIONS

DEADLINE

The bylaws of the Faculty provide that resolutions to be submitted to the House of Delegates at the Faculty's Annual Meeting must be in the Faculty office eight weeks before the date of the Annual Meeting.

The dates for the Annual Meeting are May 2 through 5, 1979; therefore, resolutions must be in our hands by

FRIDAY, MARCH 9, 1979.

CORRECTION

In the November Newsletter it was reported that physicians fees had increased .08% when this should have been 0.8%; and the figure quoted as .06% should have read 0.6%.

The period covered was for the 12 months ending August, 1978. Other data in this news item is correct.

SECOND
OPINIONS

Second opinion programs are now in effect for Medicare recipients, as well as selected groups, through Blue Shield of Maryland, Inc., and through some commercial carriers.

Contrary to what has been publicized, not all Blue Shield subscribers are eligible for payment for second opinions; nor are all subscribers to commercial insurers eligible.

Physicians are urged to carefully evaluate their billing procedures when rendering a second opinion on individuals requesting such consultation.

The Faculty's Council has adopted a position statement in connection with second opinions which can be found on page 76 of this issue of the Journal.

SPECIAL
AWARD

In conjunction with the National Association of Medical Exploring, the AMA will recognize an outstanding medical explorer or explorer post at the 1979 Annual Meeting of the House of Delegates. For details, contact the Faculty office, 539-0872.

MEDICAID
TO USE
CPT4

Effective for procedures carried out on February 1, 1979, and thereafter, the Medicaid program will commence to use CPT4 for processing all bills received for services rendered to recipients.

A special mailing has been sent to all physicians who treat Medicaid patients. In this communication, full details are spelled out as to how billing should be done. Certain adjustments in some surgical fees are being implemented at the same time.

Copies of the CPT4 may be obtained from the Faculty office at a price of \$12.00. The appropriate payment must be received prior to mailing of the book.

Important data on the pain of acute cystitis:

In 87% of patients studied (303 of 349), Azo Gantanol reduced pain and/or burning within 24 hours*

A controlled, multicenter study assessed the efficacy of Azo Gantanol in relieving pain and/or burning associated with acute urinary tract infection in patients with at least 100,000 colonies per ml of a sulfonamide-sensitive organism, usually *E. coli*. In 87% of patients with initial symptoms rated "moderate to severe," Azo Gantanol therapy resulted in improvement within 24 hours.

Fast pain relief plus effective antibacterial action

Azo Gantanol®

Each tablet contains 0.5 Gm sulfamethoxazole and 100 mg phenazopyridine HCl.

for the pain for the pathogens

Before prescribing, please consult complete product information, a summary of which follows:

Indications: In adults, urinary tract infections complicated by pain (primarily pyelonephritis, pyelitis and cystitis) due to susceptible organisms (usually *E. coli*, *Klebsiella-Aerobacter*, *Staphylococcus aureus*, *Proteus mirabilis*, and less frequently, *Proteus vulgaris*) in the absence of obstructive uropathy or foreign bodies. **Note:** Fully coordinate *in vitro* sulfonamide sensitivity tests with bacteriologic and clinical response; aminobenzoic acid to follow-up culture media, increasing frequency of resistant organisms limit the usefulness of antibacterials including sulfonamides. Measure sulfonamide blood levels; variations may occur, 20 mg/100 ml should be maximum total level.

Contraindications: Children below age 12, sulfonamide hypersensitivity; pregnancy at term or during nursing period; because Azo Gantanol contains phenazopyridine hydrochloride it is contraindicated in glomerulonephritis, severe hepatitis, uremia, and pyelonephritis of pregnancy with disturbances.

Warnings: Safety during pregnancy not established. Deaths from hypersensitivity reactions, agranulocytosis, aplastic anemia and other blood dyscrasias have been reported and early clinical signs (fever, throat, fever, pallor, purpura or jaundice) may indicate serious blood disorders. Frequent CBC (urinalysis with microscopic examination are recommended during sulfonamide therapy).

Precautions: Use cautiously in patients with impaired renal or hepatic function, severe chronic bronchial asthma; in glucose-6-phosphate dehydrogenase-deficient individuals in whom dose-related hemolysis may occur. Maintain adequate fluid intake to prevent crystalluria or stone formation.

Adverse Reactions: Blood dyscrasias (agranulocytosis, aplastic anemia, thrombocytopenia, leukopenia, hemolytic anemia, purpura, hypoprothrombinemia and methemoglobinemia); allergic reactions (erythema multiforme, skin eruption, Stevens-Johnson syndrome, epidermal necrolysis, urticaria, serum sickness, pruritus, exfoliative dermatitis, anaphylactoid reactions, periorbital edema, conjunctival and scleral injection, photosensitization, arthralgia and allergic myocarditis); *G.I.* reactions (nausea, emesis, abdominal pain, hepatitis, diarrhea, anorexia, pancreatitis and stomatitis); *CNS* reactions (headache, vertigo, neuritis, mental depression, convulsions, and hallucinations, tinnitus, vertigo and insomnia); miscellaneous reactions (drug fever, chills, nephrosis with oliguria and anuria, perianteritis, nodules and *E. coli* phenomenon). Due to certain chemical similarities with some goitrogens, uratics (acetazolamide, thiazides) and oral hypoglycemic agents, sulfonamides have caused instances of goiter production, diuretic and hypoglycemia. Cross-sensitivity with these agents is rare.

Dosage: Azo Gantanol is intended for the acute painful phase of urinary tract infections. Usual adult dosage: 2 Gm (4 tabs) initially, then 1 Gm (2 tabs) B.I.D. for up to 3 days. If pain persists other than infection should be sought. After relief of pain has been obtained, continue treatment with Gantanol (sulfamethoxazole) if considered.

NOTE: Patients should be told that the orange dye (phenazopyridine HCl) will color the urine. **Supplied:** Tablets, red, film-coated, each containing 0.5 Gm sulfamethoxazole and 100 mg phenazopyridine HCl—bottles of 100 and 500.

Money isn't everything.

It's knowing what to do with it that really counts.

Where to invest it. How to make it grow. Get income from it. Minimize risk and taxes.

That's why it pays to have people around you who make it their business to know. Who are investment management experts.

Like the people in the Trust Division at Union Trust Bank.

For the past ten years, our professional managers have consistently outperformed other financial institutions. The pension and profit-sharing funds and individual trusts we've handled have consistently earned top dollar. Our records prove it.

And we're ready to do our best for your portfolio. Now. First, by sitting down together and discussing your plans. Your goals. Your objectives.

Next, we come up with a program custom-fitted to your needs. To your company's future. Or to your family's future.

Then we keep you up to date by phone, personal meetings and newsletters. So you're never out of touch. And we're never out of reach.

If that sounds good to you, we've made it easy for you to get more details on our personal or corporate investment services.

Just call Larry Rosenthal, our man in charge of personal trusts, at 301/332-5515. Or Jay Neale, in charge of employee benefit plans, at 301/332-5877.

What you do with your money is their business.

A Strategy For Physician Involvement in Health Planning

The National Health Planning and Resource Development Act of 1974 (PL 93-641) has been receiving increasing attention in the physician community. This is most appropriate, as this law prescribes specific national health goals and priorities, and provides for local and State planning agencies with expanded powers.

Since the consumer/provider ratio required for the Health Systems' Agency governing body means that physician participation in the planning process will be limited, it is essential that physicians organize to make their input as effective as possible.

There are two physician organizations with good reasons to be interested in the HSA's activities. These are local and state medical societies and Professional Standards Review Organizations. Medical societies have been the traditional lobby for physician interests, and they should expect to continue that role vis-à-vis Health Systems' Agencies. The individual physician's practice can be affected by the HSA's decisions—for example, the decision to grant or refuse a hospital's application for a certificate of need for expansion will affect the number of beds available for the physician's use.

Also, the HSA's analysis of the health care system will certainly include discussion of the adequacy of medical care in the area, and the HSA's analysis of the system will lead to plans for changing it.

PSROs are a relatively new physician organization, but their interest in the Health Systems' Agency should be just as strong as that of medical societies. The Federal regulations concerning HSAs designation require HSAs to establish working relationships with PSROs for the exchange of data, as well as for other purposes. This gives PSROs a means of influencing HSA activities and plans, and therefore guarantees that physicians will have a voice in the planning process.

How effective that voice is will depend on how well organized the physician community is. Physicians can be most effective if they pool the resources of the medical society and the PSRO, plan a strategy and timetable for involvement ahead of time and then stick to it. This type of organized effort really calls for the establishment of a joint medical society/PSRO committee.

A joint committee, with the Chairperson and members appointed by the Presidents of the Society and the PSRO, ensures that the interests of both organizations are represented in discussion with the HSA. It also ensures that the physicians who hold these discussions with the HSA speak for the medical community and not just for themselves.

In order to develop a strategy for involvement and to keep up with HSA issues, this committee should

meet regularly, probably on a monthly basis. The kinds of activities this committee will carry out will vary from one HSA area to another. Its activities could include supporting the nomination of physicians to the HSA governing body and informally developing contacts with non-physician governing body members.

This increases the visibility of physicians to the governing body as a whole, and can lead to service on HSA committees. The committee will certainly want to study the health plans the HSA develops and comment on them at public hearings. These possible activities suggest that a mixture of informal and official activity by the committee is desirable.

It is clear that the members of this committee will have to be very well informed on health planning issues. The volume of information that will have to be read and absorbed may be greater than many physicians have the time or willingness to spare. However, both medical societies and PSROs have individuals on their staffs who can read these reports in their entirety, summarize them, and prepare recommendations for the committee. This can cut the demand on the committee members' time by half. After the committee has reviewed the staff report and reached a consensus regarding it, the staff can be directed to develop the committee's response into draft testimony, for further review by the committee. This further cuts the time demand on the committee members. Of course, staff can take over routine information gathering and communications for the committee as well.

Where both the medical society and the PSRO have staff who have time to work with the HSA committee, it is probably best to have both organizations contribute staff time. This assures that both groups continue to feel that they have a serious investment in the committee and its work.

However, the medical society's funding may be much more limited than the PSRO's, making it impossible for the society to provide staff to the committee. In this case, it seems appropriate for the PSRO to provide all of the staff support. The PSRO and HSA are both Federally funded, and by Federal regulations they are required to work together. Therefore, use of PSRO staff to support an HSA committee is a legitimate PSRO activity.—Marvin Mones, MD, FAAP, Past President, Montgomery County Medical Society. □

Hopkins Allergy Clinic Testing Hayfever Treatment

The Johns Hopkins Hospital Allergy Clinic is seeking patients who suffer from hayfever primarily during the months of August and September to participate in a study of injection treatment.

Doctors have known since the early 1900s that injecting extracts of some substances which cause allergies, such as ragweed, could lower a sperson's sensitivity to those substances. Since then, several approaches to this therapy have been developed.

The Hopkins investigation will compare the effects of the two major methods of injection therapy in a controlled study.

Patients wishing to be included in this study will receive a screening allergy evaluation. Those patients finally selected will be placed on a controlled program of weekly therapy. Treatment will be given free of charge.

Individuals between the ages of 18 and 50 who are interested in participating in this program should call (301) 685-3311. ☐

CONRAD ACTON, MD, Editor

New Approaches

The October, 1978 Meeting of the BCMS concerned itself with **New Approaches in Peptic Ulcer and Esophagitis**. Henry Wagner, MD, Chairman of the Program Committee, introduced Turner E. Bynum, MD, Assistant Professor of Medicine at Hopkins and Director of its Endoscopy Unit and G-I Laboratory. Starting with definitions, he emphasized that all upper gastrointestinal ulcers are peptic, but are not all the same in signs, symptoms, course and complications. He finds that most physicians and patients equate esophagitis with heart burn. He reviewed briefly the biology of ulceration and the significance of stricture, reflux, pH and duodenal enzymes. Peptic ulcer of the duodenum, he noted, is having a worldwide decreased incidence, although the natural history of peptic ulcers generally is to recur.

Traditional control of ulcer symptoms with antacids is poorly satisfactory. Milk, a favorite mainstay, actually increases acid production. Magnesium-base antacids can cause diarrhea, while those of aluminum salts constipate. Control with diet and anticholinergics has compliance problems.

Newer, more physiologic therapy has been directed toward items in gastric juice besides acid. Histamine is used to stimulate acid secretion when given in small doses. In larger doses, it can effect cimetidine block and permit healing. Complications such as perforation, CNS symptoms and effect on granulocytes must be reckoned with. It is used enthusiastically in England. Experimentally-permitted trials on this side of the Atlantic have not found it as effective.

Prostaglandins have also been tried experimentally and found effective. These are Prostaglandins E_1 E_2 A_1 ; however they are not allowed for use in the United States. Dr. Bynum feels that the future for control of peptic ulcer lies with the prostaglandins. Another drug, metapropamide, increases gastric emptying and could be useful for that effect, but it, too, is not available here.

Directors Meet

The Board of Directors got a full report from John Mulholland, MD about our exhibit at the Baltimore City Fair, our first. This was a project of the Public Relations Committee and was planned well in advance and carried out with great care and attention; 16 physicians gave their time to explain the sets and answer questions. A series of pictures taken of the action was passed around. Public response was felt to be good.

Several pitfalls became apparent and to be avoided at subsequent showings, such as the **time**, in conflict

with the Med-Chi Semiannual Meeting in Ocean City. Many physicians who would have helped, could not. The location was in proximity to booths devoted to proprietary promotions and it was felt, on this account, to be a poor one. The **competition** with other health-related groups, each espousing a worthy-enough cause, diluted effectiveness. The BCMS exhibit's push was for "the health of ALL the people" and could not limit itself to any special interest. These and other factors will be kept in mind in arranging future showings.

Fred Heldrich, MD presented the Program Committee's list of topics for 1979's monthly meetings. The 10 titles were carefully scanned by the Directors and only one was vetoed, though two more were considered chancy. Clinical topics were considered the prime attendance-builders. Titles appealing to the practitioner's interest should have the highest priority. These are such as "How to" and controversial issues that influence their practice or follow-ups on controversies. Also, the Directors discussed the fact that our meetings are accredited as CME by other organizations. Our scientific programs are highly educational, and it was felt that BCMS should be in a position to self-accredit its own programs. The means to do this will be sought.

Committee Work

Richard London, MD presented a studied report from his Policy and Planning Committee. This Committee carefully noted the changes to each of BCMS's committees and evaluated each Committee's degree of attainment. Planning Committee members attended meetings of other committees, reviewed their minutes, and brought their findings to the Planning Committee. Among the Planning Committee's recommendations, the Directors approved transfer of the subjects of mental health, alcoholism and drug abuse to the Health Care Delivery Committee. The Directors also agreed to do away with the Foreign Medical Graduate Subcommittee as no longer needed. The Professional Education Committee would then limit itself to CME and merge with the Program Committee. □

Library Expansion

Your Faculty Library is expanding! It is about two years away, but the time will come when you will find a reading room, current books and journals, and reference services all housed on the first floor of the present Faculty Building. The new arrangement will also include a History of Medicine room, a Faculty dining room with an expanded kitchen and a lounge.

All this comes about as a result of successful negotiations with the City of Baltimore for the purchase of the large building to the south of the present Faculty offices. This building (formerly School Number 49, also known as the Robert E. Lee School) is being remodeled into a headquarters building for the Faculty. When most of the Faculty's staff move next door, the Library will have much-needed room for growth. It is no secret that the Library's present stacks are almost full. Furthermore, with every addition to the Library staff, there has been a cutback in public space in the Library. For example, there has been no current periodicals room during the last year and a half.

In the new arrangement, a reading room, stacks for the current books and journals and the Public Services Department will all be located on the first floor. The present reading room will become the Louis A. M. Krause, MD History of Medicine Room, where the Faculty's rare book collection can be appropriately housed and displayed. Most important of all, shelf space for the large journal collection will be increased to allow for many years' growth.

A lounge and dining room for use by Faculty members attending committee meetings or Faculty functions will be located in the basement (near the present Journal office . . . ed. note.) We hope this area will also include display cases for the Faculty's collection of antique medical instruments.

Planning for remodeling the school building and expanding the Library is underway now. The recently-completed Library remodeling was planned to coordinate with these changes. Although the end results are still a couple of years off, they are real and can be looked forward to.

During the expansion, the Library will be seeking contributions to cover some of the costs. We hope to get fine, locking bookcases for the rare book collection, and museum cases for the instruments. We will also need new shelving for the additional stack areas and furniture for the reading room. The fact that you have a modern, efficient medical library available today results from the generosity of previous Faculty members. You can show your gratitude to these great physicians by helping to ensure that the next generation of physicians will have the same services and privileges as those you enjoy.

All contributions for the expanded Library will be appropriately and publicly acknowledged. Plaques and memorials on the present Library walls acknowledge the past contributions of Faculty members, and in the new, expanded Library, we hope to carry on this tradition. For additional information regarding contributions, please contact me at the Faculty Library.

Faculty's Art Objects to be Part of Exhibit at the Walters Art Gallery

George Lucas and the Paris Art World, 1860-1905 is the title of an exhibition scheduled to open at the Walters Art Gallery on Jan. 29, 1979. The show will run through the end of March, 1979.

A bronze plaque honoring Frank Frick, which hangs over the mantel in the Faculty Library's reading room, will be included in this exhibition. Frank Frick was a close friend of George Lucas, and this plaque represents a pertinent addition to the show.

Frank Frick was a brother of Charles Frick, MD (1823-60). In 1896, when the Faculty was desperately searching for adequate space for its reading room and Library, Frank Frick and his brother, William F. Frick, made a contribution in memory of their brother Charles to set up a reading room and Library in the then-new Faculty building at 847 N. Eutaw St. Income from the Frick endowment still helps to maintain the Faculty Library's journal collection. A large plaque in the cataloging office of the Library commemorates the Frick brothers' generosity.

JOSEPH E. JENSEN
Librarian

Toxic Substances Data Available from the Faculty's Library

Faculty members can now obtain comprehensive information about poisonous substances from one source. Toxicology Data Bank (TDB) combines the toxic chemical information from the authoritative sources (AMA Drug Evaluation, Merck Manual, Goodman and Gilman's The Pharmacological Basis of Therapeutics, etc.). This new computerized service, TDB, is part of the MEDLARS network. TDB differs from MEDLINE and other similar databases in that it provides facts regarding toxic substances instead of references to literature.

The data of TDB is extracted from many different sources: handbooks, textbooks and monographs. All the information is referenced so the original source may be consulted for more details. Each chemical record has been screened by NIH's Toxicology Study Section, composed of pharmacologists, toxicologists and analytical chemists.

Records contain chemical, toxicological and pharmacological information. Warnings, cautions, antidotes and treatments are examples of the information available for each compound. Evaluations of 1,100 compounds have been completed. An additional 1,400 compounds are in various stages of evaluation.

Searches of this database (and all MEDLARS databases) are available to the Faculty's members as a benefit of their membership. To try this new system, call or stop by the Faculty's Library.

Rehabilitation Medicine

Laboratory Differentiation of Stroke and Intracranial Mass Lesions

By LEON REINSTEIN, MD

Dr. Reinstein is Assistant Professor in the Department of Rehabilitation Medicine of the University of Maryland School of Medicine, 22 S. Greene St., Baltimore, MD, 21201, where he can be contacted for reprint and other data.

Introduction

We have previously presented the case of a stroke patient transferred to a rehabilitation center who was subsequently found to have an operable intracranial meningioma.¹

This report reviews the pathophysiologic basis for the use of the brain scan, echoencephalogram, skull X-ray, electroencephalogram, lumbar puncture and computerized axial tomography (the CAT Scan), in the diagnostic evaluation of the stroke patient suspected of having an intracranial mass lesion (ICML).

Brain Scan

Normally the blood-brain barrier prevents a radioactive drug from diffusing into the brain. In cerebral tumors, recent cerebral infarctions, subdural hematomas and brain abscesses, there is a change in the permeability of the blood/brain barrier and/or increased vascularity, which results in abnormal regional accumulations of radiation demonstrated by scintillation scanning.²

Cerebral Infarction is characterized by an abnormal area of increased uptake of radioactivity which follows a familiar anatomic distribution coinciding with an area of the brain served by a principal nutrient artery (e.g., the middle cerebral). In 80% of the cases, this is seen four-seven days after the onset of the stroke. Occasionally, the scan may be abnormal earlier, reflecting increased perfusion of tissue surrounding the infarct. In either case, the abnormal area will decrease in size by six weeks and should return to normal by three months; 75% of patients with a cerebral infarction will have an abnormal brain scan.³

A **Cerebral Tumor** or **Brain Abscess** characteristically produces a round or irregularly lobulated area of abnormal activity. A repeat scan done after several weeks will show an increase in size; 80% of brain tumors will have an abnormal scan.³

A unilateral **Subdural Hematoma** characteristically produces a crescent-shaped increase in the thickness of the vascular rim on one side of the skull, usually seen only on the anterior-posterior projection. As with infarction, these changes are usually seen first four-to-

seven days after the onset of the subdural hematoma. With time, there may be an increase in size or resolution.⁴

Thus, a progressive increase in size of the affected area on serial brain scans suggests an ICML. An initial normal scan followed by an abnormal scan shortly thereafter, a decreasing abnormal uptake on serial scanning, and the specific anatomic location of the abnormality help confirm the diagnosis of a cerebrovascular accident.

Echoencephalography

Almost all cerebral tumors, unilateral chronic subdural hematomas and brain abscesses cause a displacement of the midline intracranial structures which produces a significant shift of the midline echo toward the side opposite the lesion. Only one-third of cerebral infarctions have a significant midline shift, however, midline shifts due to cerebral infarction usually have a lower value (mean of 4-5 mm.) compared to shifts due to ICML (mean of 7-9 mm.) Mass lesions located in the occipital-temporal region of the posterior fossa, and bilateral chronic subdural hematomas, do not produce a midline echo shift.⁵

Abnormal echoes may occur at the interface between the surfaces of the brain and a tumor, abscess wall or blood accumulation. These are frequently seen in chronic subdural hematomas (85%) and occasionally seen in tumors (25%) and abscesses (25%). They are not seen in cerebral infarction.⁵

Thus, echoencephalography which reveals a 7-9 mm. shift of the midline echo, or abnormal echoes, is highly suggestive of an ICML.

Skull X-rays

Routine skull X-rays demonstrate significant abnormalities in over 70% of ICMLs. After one-four months of increased intracranial pressure, decalcification of the sella turcica occurs. This is found in 30% of cerebral tumors and brain abscesses.⁶

The pineal gland is calcified in 60% of adults. A 3 mm. displacement from the midline of the calcified pineal gland is found in 25% of supratentorial masses. However, this displacement may also be present in massive cerebral infarction and in cerebral hemorrhage. Also, a calcified pineal gland may appear midline in bilateral subdural hematomas, a subdural hematoma

less than 100 cc. in size, or one which is subfrontal, temporal or infratentorial.⁷

The combination of decalcification of the sella turcica and a displaced pineal gland on skull X-ray is strongly suggestive of an ICML.

Other less common abnormalities which may be seen on skull X-ray include intracranial calcification and bony erosion in a cerebral tumor; a fracture line and bony erosion in a chronic subdural hematoma; a fracture line, otitis, sinusitis and mastoiditis in a brain abscess and vessel calcification in cerebral infarction.^{3, 7}

Electroencephalography (EEG)

There are abnormal EEG findings in most cases of cerebral infarction and ICML. Seventy-five percent of **Cerebral Infarctions** demonstrate suppression of the alpha rhythm (frequency 9-11 cps). Half of these abnormal EEGs will return to normal in one-two months; 10-25% will develop sharp waves indicating an irritative focus.⁸

Eighty percent of **Cerebral Tumors** will demonstrate a delta focus (frequency < 4 cps) which becomes more prominent on serial examination; 25% also have sharp waves. The tumor itself does not give rise to the abnormal electrical activity. Rather, the tumor produces metabolic abnormalities in the adjacent neurons, probably secondary to edema, and these neurons produce the electrical abnormalities seen.⁸

More than 90% of **Subdural Hematomas** and **Brain Abscesses** demonstrate progressive alpha suppression and generalized delta waves. They can be differentiated by the very low (40uv) amplitudes seen in a subdural hematoma and the very high (500 uv) amplitudes seen in a brain abscess.⁸

Thus, the findings of delta waves and progressive abnormalities on EEG suggest an ICML.

Lumbar Puncture

A **Cerebral Infarction** usually produces a normal cerebrospinal fluid which is clear and colorless, has 0-5 lymphocytes or monocytes, but no red cells or polymorphonuclear leukocytes, and normal protein and pressure values.⁷

A **Brain Tumor** usually produces non-specific elevations in protein and pressure which may also be seen in massive cerebral infarction, brain abscess and chronic subdural hematoma. Various authors have been able to find tumor cells in the cerebrospinal fluid of only 25% of patients with brain tumors.^{9, 10} They stress that neoplasms not having direct contact with the ventricular or ependymal surface will have a negative spinal fluid cytology.

A **Chronic Subdural Hematoma** may produce spinal fluid that is either xanthochromic (50% of cases) or bloody (10%). Xanthochromia indicates that bleeding occurred more than two hours, but less than four weeks previously. Bloody or xanthochromic cerebrospinal fluid may also be seen in hemorrhagic infarction, late cerebral embolism and most cases of intracerebral hemorrhage and subarachnoid hemorrhage.⁷

A **Brain Abscess** usually demonstrates an increased number of polymorphonuclear leukocytes and lymphocytes. However, this may also be seen in a cerebral infarction which occurs near the subarachnoid or ventricular space.⁷

Meningovascular syphilis, paresis and a gumma may all present signs and symptoms suggestive of cerebrovascular disease. As 10-15% of patients with active neurosyphilis have a non-reactive blood serum, spinal fluid serology may be the only method of making a definitive diagnosis of neurosyphilis.⁸

Thus, except for the rare case of neurosyphilis, the cerebrospinal fluid findings in cerebral infarction, cerebral tumor, chronic subdural hematoma and brain abscess are usually non-specific and of limited value in differentiating a cerebrovascular accident from ICML.

However, the risks of performing a lumbar puncture in a patient suspected of having an ICML are substantial. There is danger of cerebral trans-tentorial or cerebellar parafoveal lobular herniation and death due to the presence of increased intracranial pressure. Stuteville and Welsh¹¹ had two sudden deaths during lumbar puncture in 42 patients with subdural hematoma. Frankel and German¹² reported two fatalities directly attributable to lumbar puncture among 219 patients with glioblastoma multiforme. It is noteworthy that these herniations are the usual pathophysiological mechanism of death in most cases of cerebral tumor, subdural hematoma and brain abscess.

Thus, lumbar puncture is of limited value and carries a significant mortality in the stroke patient suspected of having an ICML. Its cautious use is recommended only when neurosyphilis is suspected.

Computerized Axial Tomography (CAT Scan)

This is a new, noninvasive radiologic technique developed in England¹³ and first used in the US in 1973.¹⁴ A narrow beam of x-rays traverses a 13 mm. slice of skull and brain producing 28,800 data points per slice. Each data point represents a tissue segment 3 X 3 X 13 mm. The 28,800 readings are processed by a computer and relative absorption coefficients are calculated. These values are fed to a cathode ray tube and a picture is generated in which the brightness of each point is proportional to its absorption coefficient. A photographic print is then made of the picture clearly showing the skull, gray matter, white matter, ventricles and subarachnoid spaces.¹³

Disease processes are seen as changes in the capacity of the tissues to absorb X-rays producing alterations in density. Increased density (white areas) are found in clotted blood, calcium deposits and dense fibrotic tissue. Decreased density (dark areas) are found in tissue necrosis, edema, cyst formation and unclotted hemorrhage. These findings are often accompanied by distorted anatomy, particularly displacement of the midline structures.¹³

Cerebral Infarction initially produces a diffuse, low density, necrotic area involving the cortex gray and

white matter. By two-four weeks, the area of necrosis is more sharply defined and there may be a central area of increased density due to hemorrhagic alterations. Resolution proceeds during the next four-five months with disappearance of the edema, hemorrhagic tissue and necrotic tissue; decrease in size and finally formation of a lacuna similar in density to cerebrospinal fluid.¹⁵

A **Cerebral Tumor** may demonstrate an area of increased density due to viable tumor tissue, calcification or hemorrhage into the neoplasm. An area of decreased density may also appear due to edema of the adjacent brain, cystic fluid within the tumor or tissue necrosis. Displacement of the ventricular system is usually present due to the mass effect.¹⁵ Paxton and Ambrose¹⁶ studied 232 patients with cerebral tumors, and the CAT Scan was abnormal in 194 patients (85%). Zelch et al.¹⁷ detected three unsuspected tumors by CAT Scan among 51 patients suspected of having cerebrovascular disease.

A **Brain Abscess** will show a well-circumscribed area of decreased density secondary to necrosis and edema.¹⁸ There may also be displacement of the midline structures.¹⁶

An **Acute Subdural Hematoma** will produce a crescent-shaped area of increased density located along the convexity of the brain with displacement of the midline structures to the contralateral side. However, identification of a Chronic Subdural Hematoma may be more difficult. As the clot ages, much of the material is absorbed and it may become less and less dense until its density equals that of the adjacent brain and the area appears normal. Finally, after significant absorption, an area of decreased density will be seen. The midline structure displacement usually persists.¹⁸

Thus, early studies indicate that CAT Scans are helpful in differentiating ICML from a cerebrovascular accident. A progressive process and significant midline structure displacement suggest an ICML.

Summary and Conclusions

1. The brain scan, electroencephalogram, skull X-ray, echoencephalogram and computerized axial tomography (CAT Scan) are safe, non-invasive procedures which provide valuable information in the differentiation of a cerebrovascular accident from an intracranial mass lesion (ICML).

2. Specific abnormalities which suggest an ICML include:

- A progressive increase in the size of the affected area seen on brain scan.
- A 7-9 mm. midline shift and abnormal echoes observed on echoencephalography.
- Decalcification of the sella turcica and displacement of the pineal gland noted on skull X-ray.
- Delta waves and progressive abnormalities on electroencephalography.
- A progressive process and significant midline structure displacement seen on computerized axial tomography (CAT Scan).

3. The Cerebrospinal Fluid findings in a cerebrovascular accident and ICML are usually non-specific and of limited diagnostic value. Furthermore, there is a significant mortality associated with lumbar puncture in patients with an ICML. Therefore, lumbar puncture is not recommended in the diagnostic evaluation of the stroke patient suspected of having an ICML, unless neurosyphilis is strongly suspected.

Health in History

Update:

The Hohenzollerns, Field Marshal Rommel, Benito Mussolini and Count Galeazzo Ciano

By BLAINE TAYLOR

Contact Mr. Taylor, Managing Editor, for reprint and other information c/o the *Journal*, 1211 Cathedral St., Baltimore, MD 21201.

Introduction

Since September, 1975, the *Journal* has been publishing an award-winning series of articles describing how health has played a significant part in the shaping of international political events and history.

Periodically, in addition to the fullscale studies offered (19 to date), there will be special "update" pieces to acquaint the readership with new or hitherto-undiscovered aspects or sources relating to medical case histories already detailed in previous issues. The first such update appeared in the April, 1977 edition of the *Journal*, concerning the Kennedy family and Alabama Governor George C. Wallace.

It is hoped that this practice will serve reader continuity of understanding of the series overall.

The Hohenzollerns

The June, 1976 *Journal* featured a **Health in History** cover story entitled **The Hohenzollern Kaisers: A Medical Casefile**, which was a rather detailed look at the cancer and other health problems of Kaisers Wilhelm I, Frederick III and Wilhelm II and Kaiserin Victoria of Imperial Germany (see following Table 1.)

The following year, two new studies of the Kaiser of World War I appeared: a fullscale portrait, **The Last Kaiser: A Biography of Wilhelm II, German Emperor and King of Prussia**, and the autobiography of his only daughter and sole surviving child (of seven; see Table 2), **The Kaiser's Daughter: Memoirs of Her Royal Highness Victoria Luise, Princess of Prussia**.

Table 1: Partial Hohenzollern Family Tree

(1882-1951; abdicated 1918) |

—Table by Blaine Taylor

The medical findings of these two works, plus those of two other sources—**The Kaiser and His Court** (from the papers of German Admiral Georg Alexander von Müller) and Denis Judd's **Eclipse of Kings: European Monarchies in the 20th Century**—have been combined to add the following details to the *Journal's* earlier study of this ill-fated dynasty.

Fritz and Vicky

On Apr. 24, 1916—during the height of the First World War

KAISER WILHELM II AND KAISERIN AUGUSTE VIKTORIA at Bad Homburg in 1917, during World War I.

Table 2: The Family of Kaiser Wilhelm II

Six Sons		
Crown Prince Wilhelm ("Willie") 1882-1951	Prince Eitel-Frederick ("Fritz") 1883-1942	Prince Adalbert 1884-1948
Prince August Wilhelm ("Auwi") 1887-1949	Prince Oskar 1888-1958	Prince Joachim 1890-1920
Daughter		
Princess Viktoria Louise 1892-		

fighting on the Western Front in Europe—Adm. von Müller, Chief of the German Naval Cabinet, wrote in his diary at Kaiser Wilhelm II's military headquarters at Charleville in German-occupied France: "This evening, while we were standing about after dinner, the Kaiser told us some unpleasant details of his relationship with his parents during his father's illness. The Empress Frederick emerged in an exceedingly bad light."¹

This notation—made about events that occurred 28 years earlier—concerned the death from throat cancer of his father, the unfortunate Kaiser Frederick III, who ruled for a mere 99 days in 1888, after the demise of his father, Kaiser Wilhelm I at age 90 the same year.

Tyler Whittle, author of *The Last Kaiser*, points out that the

English physician Sir Morell MacKenzie diagnosed then-Crown Prince Frederick (in 1887) as having syphilis (according to attacks being printed at that time in the French press), and this was confirmed by a German Dr. Schmidt of Frankfurt "by prescribing the accepted cure for syphilis."²

During 1888-1901, the widowed Empress Frederick (Kaiserin Victoria) lived a shadow existence, while her son ruled in her dead husband's place. A liberal Englishwoman (she was the daughter of Queen Victoria), "Vicky" had always been unpopular in Germany. During the Franco-Prussian War of 1870, she'd established a combat hospital behind the German lines, but "Her hospital found little favor with the German medical profession. She was told that English

methods were not suitable."³

She had outraged German medicine twice in her life, by employing English—not German—medical advice during the birth of her eldest son (1859) and her husband's terminal illness, and herself died of cancer with a British physician in attendance on Aug. 5, 1901.

"Kaiser Bill"

Allied propaganda of World War I depicted Wilhelm II as both a buffoon (nicknamed "Kaiser Bill") and as a grasping, all-powerful Supreme War Lord (his official German title); neither portrait was near the mark, however. First, when war came in 1914, he tried to prevent it and, second, soon after hostilities commenced, the Emperor lost control of his war machine to his generals. As he once told his last Imperial Chancellor, Prince Max of Baden, "If people in Germany think I am the Supreme Commander, they are grossly mistaken! The General Staff tells me nothing and never asks my advice. I drink tea, go for walks and saw wood . . ."⁴ Later, in 1917, he exclaimed, "I am only Hindenburg's adjutant and I have nothing to say."⁵

The reasons for the Kaiser's displacement in power were twofold: first, he didn't really *want* the responsibility, and second, his prior inconsistency in matters of state was notorious, a visible part of his nervous, unstable temperament: "He had no fixed policies, no sober personal philosophy to give him direction and, as he lurched from one 'initiative' to another, the ship of state lurched with him."⁶ The Kaiser's impact on the course of the war was, overall, negligible."⁷

During the four-year passage of the war, as we shall see, the Kaiser suffered from a host of both minor and some major physical problems. At least some of these derived from his boyhood, such as his propensity for catching the common cold. When he was three, his mother wrote of him:

William has inflamed eyes and is shut up in his room, which makes him look like a cheese. His eyes discharge a good deal of matter and are swollen; he had this before (five months previously, but it was only one eye then and now it is both.) Wegner says it proceeds from cold."⁸

THE KAISER'S DAUGHTER, PRINCESS VIKTORIA LOUISE, (left) riding on the Tempelhofer Field in Berlin in 1911 with her brothers, Prince August Wilhelm (center) and Crown Prince Wilhelm (at right, turning in the saddle.)

A biographer adds, "It was not only a question of colds. The ordinary course of childhood ailments, which (his brothers) Charly and Harry shrugged off so cheerfully seemed so much worse when he caught them."⁹

During World War I, Adm. Müller noted in his diary that the Kaiser suffered from colds on Feb. 4, 1917 ("severe") for which he took "a Turkish Bath cure" and on Jan. 15, 1918: "The naval report was cancelled this afternoon because His Majesty has retired to bed. . ." He further noted when Wilhelm caught "chills," such as on Dec. 5, 1914,¹² Feb. 3, 1916,¹³ again on Feb. 13th ("very bad") coupled with tonsillitis,¹⁴ on Nov. 7, 1916 (when the Kaiser felt he was close to having pneumonia)¹⁵ and yet again on Nov. 15, 1917.¹⁶

To forestall these recurrent colds and chills, the Kaiser, in pre-war days, took some unusual measures, as one of his biographers notes:

"She also found his dread of infection inconvenient because, at the discovery of measles or mumps in the palace, he would at once move elsewhere and at half an hour's notice everyone had to follow. On one occasion, the Court was settling into the Bellevue Palace for the winter instead of the Old Palace in Berlin—a change of plan welcomed by everyone—when Prince Oscar, who had just returned from Italy, went down with chickenpox. All the repacking and moving to another palace proved fruitless because no sooner had they arrived in their new refuge than Prince August William went down with the same disease. Again there was uproar. As if this sudden flight was not bad enough, it was discovered it had been quite unnecessary. Lack of communication had caused the Kaiserin to insist on the moves for the Kaiser's sake, but afterwards to everyone's vexation and surprise, he announced that in fact he had had chickenpox years before and had simply done what the doctors had ordered."¹⁷

On Apr. 20, 1917, Von Müller noted in his diary the Kaiser's "grossly overheated bedroom"¹⁸ and that His Majesty ". . . sat up in bed and confessed that he had not slept a wink for six nights."¹⁹ The Kaiser often would use his inability to sleep or the uncomfortableness of military headquarters as excuses to retreat personally further from the war zones and enjoy a life of ease in the rear areas.²⁰⁻²¹ The overall impression that this left on even his closest associates was one of Imperial indolence ("The Kaiser declared

that he could not see the Chancellor tomorrow before six o'clock. He wanted to spend the morning in the gardens of Sans Souci and he must sleep after lunch,")²² in the face of mounting crisis on the combat fronts both East and West. By Aug. 16, 1917—with the end of the war more than a year away—Von Müller wrote of the Kaiser's rela-

tions with his top military commanders: "He is now completely left out in the cold. . . because he has failed in his duty. . ."²³ As early as Apr. 18, 1915, he noted a bizarre medical plot against the Kaiser's lack of wartime leadership: "Valentini. . . confided to me that the Kaiser's physician, Dr. von Neidner, is worried about an intrigue at Head-

GERMAN CROWN PRINCE WILHELM IN THE 'THIRTIES, wearing the uniform and shako of the Death's Head Hussars, in which he was buried in 1951. Nicknamed "Little Willie" and "the Greyhound" (because of his slender figure), his extramarital affairs discredited the Hohenzollern Dynasty.

quarters to declare the Kaiser temporarily incapable of ruling and to make the Crown Prince Regent. A wild pipe dream!"²⁴ After the war's loss—when editing his diaries for eventual publication following the death of both himself and the Kaiser—Von Müller added to his passage: "I heard no more of the matter at the time. It never became dangerous and never presumably got further than private talk."²⁵

Oddly enough, Wilhelm was neither indolent nor disinterested in the war's outcome. As regards the first, he was, physically, an extraordinarily active man. Before the war, "Every afternoon, when the Kaiser was at home, he walked with the Kaiserin, and he shot, rode, drove, hunted, boated, skated and tobogganed with. . . energy."²⁶ As early as January, 1915 (during the war), he was sawing wood for exercise,²⁷ and, indeed, in his postwar exile in Holland, felled 17,000 trees in his 60s.²⁸ Moreover, by all accounts, he was happy in his marriage to his first wife, the Kaiserin, and had a healthy sex drive that resulted in seven offspring (see Table 2).²⁹

Personally, he was physically courageous, too. On Apr. 25, 1916, French planes staged a bombing attack on Headquarters at Charleville, in which the engineer of the Imperial train was killed, but Wilhelm II remained there nonetheless.³⁰ He did, however—like most monarchs of his time—fear assassination³¹ (and with good reason: in November, 1900, "a demented old woman . . . threw an ax at him, but missed" and ". . . in 1903. . . a feeble-minded youth hurled a piece of iron at him and wounded him under the right eye."³² His fear of illnesses can also be found to have a rational basis, as, in 1866, his brother Sigismund died of meningitis³³ and his brother Waldemar 12 years later during a typhoid epidemic.³⁴ (As has earlier been seen, both his parents died of cancer, and he underwent a successful throat operation for it himself in 1904.)³⁵ Also, as was noted in the *Journal's* prior piece on the Kaiser,³⁶ his dislocated left arm (suffered at birth) hampered his ability to ride, walk, stand and even feed himself—although he managed to

do all these normally "taken for granted" things quite well even as a teenager³⁷ through rigorous training.

His seeming disinterest in the war sprang from his belief—developed early-on, possibly after the First Battle of the Marne in 1914—that Germany couldn't defeat the world. Despite this, however (and naturally) he wanted to believe his country would win, and would veer from making irrational statements about the German Army conquering all in its path, when, in fact, the news from the battlefields was bad, to ensuring that wounded English soldiers received the same medical treatment as wounded Germans.³⁸

This erratic behavior led some—even in his inner circle—to conclude that he was mad. Von Müller wrote on May 16, 1916: "His Majesty does not appear to be in his right mind."³⁹ In 1927, nine years after the war, Von Müller added that the Kaiser's bold speeches in the face of military defeat "Can only be explained by the presumption that the Kaiser's mental balance had been disturbed by the long, nerve-racking war."⁴⁰

In truth, the Kaiser's nerves were bad—and always had been, even before the war, which merely served as the catalyst to bring them to the attention of his officer corps, which—prior to 1914—had never observed Wilhelm at close quarters except on the annual Imperial Maneuvers.

"The medical profession states that men can and often do suffer the emotional stresses experienced by females in the menopause. If this was the case with the Kaiser, it would explain his increased nervousness and tension in his early middleage. Jan. 29, 1899 was his 40th birthday. He wrote to Queen Victoria that the strain of his office was 'often too heavy to bear' and described himself as 'her queer and impetuous colleague.' She noted in her journal: 'I wish he were more prudent and less impulsive at such an age!'"⁴¹

Wilhelm II was given (like Hubert Humphrey) to public weeping as when, in 1908, he almost abdicated the throne over an intemperate newspaper interview he'd granted,⁴² and again, eight years later, when he was forced to replace Gen. von Falkenhayn with Von Hindenburg.⁴³ As the war went on, his nerves worsened. He was ". . . difficult to live with. There was

no telling how well or ill he would be from day to day; no way of telling why the barometer of his moods moved up and down so rapidly, nor how long he would be in euphoria or depression. . ."⁴⁴ He suffered near-complete nervous breakdowns in April, 1917⁴⁵ and in October, 1918 (along with the Empress) when he realized for sure that the war was lost (and was walking with a cane due to sciatica.)⁴⁶

In addition to bouts of nervous depression, the Kaiser suffered during 1914-18 from "a slight heart attack" on July 9, 1916⁴⁷ (and another on Apr. 18, 1917,⁴⁸ a sore throat on July 17, 1916, a hernia operation in February, 1917⁵⁰ and an arthritic attack coupled with "rheumatic pains" in October, 1918.⁵¹

The effect of all these things—considering his past history—was, perhaps, predictable:

"The Kaiser, it is alleged . . . escaped into a world of fantasy. Certainly he began to rush about inspecting troops, distributing Iron Crosses in person and addressing parades with long speeches. His vigor and stamina were remarkable. He moved so fast that his generals could hardly keep pace with him and one, on a hot day, fainted with fatigue. He went as close to the front as Ludendorff permitted, driving through the shelled and burnt villages in a motorcar displaying the yellow Imperial standard. It was noticed that he had aged perceptibly. His hair had grayed, and his face had become lined . . ."⁵²

This was the situation at the war's end in November, 1918, when the Kaiser's generals and civil servants forced both him and his son, Crown Prince Wilhelm, to abdicate and seek asylum in neutral Holland. Civil war broke out in Germany as the military mutinied, the Hohenzollern Dynasty was overthrown and a Socialist Republic proclaimed.

Hohenzollern Twilight, 1918-79

During the later war years, the health of Wilhelm II's first wife—the Kaiserin Auguste Victoria (nicknamed Dona) also gave way. Von Müller confided to his diary on March 3, 1917: "The Empress looked very ill."⁵³ She was, in fact, suffering from a cardiac condition,⁵⁴ and had a stroke on Aug. 18, 1918.⁵⁵ Despite her illness, how

ever, she was courageous enough to face down the Red revolutionaries when they came to the New Palace at Potsdam near Berlin during the Revolution of November 1918 (no mean task when one considers the murder of the Tsar and his family in Russia by the Reds!)⁵⁶

During the final days of the war, the Kaiser had spent three weeks away from Headquarters to care for his ailing wife,⁵⁷ and their eventual reunification in exile in Holland brought them even closer together, but the suicide death by shooting of their youngest son, Prince Joachim, 30, on July 18, 1920⁵⁸ aggravated her already-serious condition and she died on Apr. 11, 1921.⁵⁹

In the midst of his travail, it's no wonder the Kaiser himself didn't think of suicide, but he'd earlier rejected it as "...an abnegation of duty and a pathetic and sinful means of escape. . ."⁶⁰ In 1922, ill in bed, he wrote his daughter: "Lying alone and miserable. . .a frugal pleasure which doubles the severity of loneliness, in that one lacks the true devotions of a woman. . ."⁶¹ Later that year, he married a widow 24 years younger than himself, Princess Hermine von Schoenau-Carolath.⁶² The Kaiser lived happily with her for almost 20 years until his death at age 82 on June 6, 1941;⁶³ Princess Hermine died six years later of a heart attack while in Soviet captivity following World War II.⁶⁴

The Kaiser's younger brother, Prince Heinrich—an Admiral in the Imperial German Navy—died in 1929 at age 67.⁶⁵ (Two of his three sons had hemophilia, the disease that—as we shall see in a future article—helped cause the downfall of the Romanov Dynasty in Russia.)⁶⁶

One by one, following the tragic death of Prince Joachim, the Kaiser's remaining five sons perished: Hitler-Frederick ("Fritz"), 59, in Potsdam in 1942,⁶⁷ Prince Adalbert, 64, in 1948 in Switzerland,⁶⁸ Prince August Wilhelm ("Auwi," a Nazi sympathizer), 62; Crown Prince Wilhelm, 69, of a heart attack in Germany⁶⁹ and Prince Oscar, 70 (who'd suffered a nervous breakdown in October, 1915),⁷⁰ in Munich on Jan. 27, 1958 (his fa-

ther's birthday.)⁷¹

Today, of his seven children, only the Kaiser's sole daughter—Victoria Luise, 85, Princess of Prussia—remains. Her own husband—Ernest August, Duke of Brunswick—died in 1954.⁷²

Field Marshal Rommel

The very month (October, 1977) that the *Journal's* case study—**Field Marshal Erwin Rommel: The Desert Fox**—appeared, there was also published the first real, fullscale biography since the late Desmond Young's controversial 1950 portrait, **Rommel: The Desert Fox**. This was British revisionist historian David Irving's **The Trail of the Fox: The Search for the True Field Marshal Rommel**. Earlier in 1977, Irving had published his **Hitler's War** amid a storm of criticism over some of his conclusions concerning exactly who in the Nazi hierarchy (Hitler or Himmler, or both) had ordered the extermination of the Jews in Europe. The resultant publicity surrounding **Hitler's War** completely obscured the fact that a new Rommel biography was about to appear. Had I known this, I certainly would've delayed my own work in order to include the results of Irving's medical research work on Rommel. When the book did appear, it, too, generated controversy, as shown in this Reuter's dispatch from London:

"Rommel, the legendary Desert Fox who was Germany's most famed World War II general, is depicted in a new book as an artless man who often raged at his colleagues and was prone to chronic moods of self-pitying defeatism.

"He was also firmly loyal to Hitler, even though he put his views outspokenly to him. And he was not part of the plot to assassinate the German Führer on July 20, 1944, the book says. Rommel poisoned himself on learning he had been implicated by others in the plot."⁷³

Medically, however, the book did **not** contradict any of the *Journal's* own findings on Rommel as a patient, and the historical implications that his illnesses had weren't challenged, either.

The book did, however, add some detail to the Field Marshal's casefile not presented in the *Journal's* coverage, such as that he'd broken his right ankle in 1907 "jumping over a stream"⁷⁴ and that before the German Army accepted

TIRED OF TALKING TO THE PHONE COMPANY?

TALK TO RCA.

An RCA telephone system for your business can save you money.

There's no down payment. No added fee for installation. And lower monthly phone bills, depending on local rates. You may even qualify for a tax investment credit...and save even more.

We can give you a compact, custom-designed solid state, electronic system with as few as seven lines or as many as thousands.

And here's the best part. RCA telephone systems are backed by RCA service. That means qualified RCA telephone systems specialists, on call 24 hours a day at offices coast to coast. By now, we ought to be ringing some bells with you.

Write today for more information, or call (609) 665-5273. RCA is talking business.

him for service in 1910, his father had to arrange and pay for an operation for inguinal hernia for his son.⁷⁵

During the Polish campaign of 1939, Irving reports, Rommel—then Commandant of Hitler's military headquarters in the field—'Noticed the first heart complaints and once he felt distinctly faint. He has told nobody but Lucie (his wife—ed. note.) She has sent him a big packet of Lecithin medicine.'⁷⁶ In February, 1940, when Hitler appointed him to an active 'divisional command, Rommel took up 6 AM jogging to get back into good physical shape' (he was almost 50.)⁷⁷

In July, 1941, when he felt ill and his wife urged him to see a doctor, states Irving, Rommel replied: "I don't trust doctors. In 1915, they wanted to amputate my leg!"⁷⁸ In 1944, while awaiting the D-Day invasion of France, Irving says Rommel suffered "a return of his old lumbago trouble."⁷⁹

Finally, Irving supplies the first name—Georg—of a man (Gen. Stumme) that Rommel was to succeed and be succeeded by at two important points in his career—something no other Rommelian author had been able to do.

The publication of the *Journal's* Rommel piece touched off a worldwide demand for the article that continues. Favorable letters concerning it were written by Baltimore Mayor William Donald Schafer and West German Navy Freigattenskapitan (Frigate Capt.) Hans J. Schafer, Commandant of the destroyer *Rommel*.

Capt. Schafer wrote the *Journal* "Since January (1978), my ship is in the shipyard (at Kiel, West Germany—ed. note) for a short overhaul, so I had time for studying your very interesting article I have read, of course, a lot about the Field Marshal, and most of the reference in your article are well-known to me. Nevertheless, I discovered a lot of new details and found new contexts and interesting connections. I also discovered small misrepresentation. On page 41, you mentioned that Rommel by-passed the grade of Brigadier General and jumped from Colonel to Major General. In the former Wehrmacht, there was not a rank

of Brigadier General, so it was quite normal to be promoted from Colonel to Major General.”⁸⁰

The *Journal* article is now on deposit in the ship’s library.

The Duce (Leader) as Patient

The *Journal*’s inaugural *Health in History* article, published in September, 1975, was *Benito Mussolini: A Medical Case History*, followed by a brief update—*Mussolini Revisited*—in the July, 1976 edition. Since that time, the English language versions of the memoirs of both his widow, Rachele Mussolini (*Mussolini: An Intimate Biography*) and eldest daughter, Countess Edda Mussolini Ciano (*My Truth*) have become available to me throwing new (but not contradictory) light on the *Journal*’s initial findings concerning the Duce’s case, plus some interesting sidelights on his son-in-law and Italian Foreign Minister Galeazzo Ciano.

In April, 1926, after he’d presided over a medical gathering at the Capitol in Rome, Englishwoman Violet Gibson fired five revolver shots at Mussolini, and one of the bullets wounded him in the nose. As he later told his wife, “You know, Rachele, it wasn’t the Englishwoman who nearly killed me, but the doctors! I was unlucky. It was a medical congress, and a score of them jumped on me, all hoping for the honor of saving Mussolini. I was afraid I’d never survive in the crash and had to fight my way out with fists!”⁸¹ On Oct. 31, 1926, “a young man fired at him and missed. . . His escape from death had been slender. Not until we were traveling home did he notice the scorch marks on his jacket, and at the Villa Carpena, I noticed blood on both vest and shirt. A bullet, grazing the skin above his heart, had been deflected by a notebook.”⁸²

Mussolini, as his widow points out, had always led a life tinged with physical danger, especially in his early pre-World War I days as a Socialist agitator, when he literally crossed swords in order to save his life: “Each time Benito disagreed with anyone—a political opponent or even a friend—the argu-

ment had to be settled on the dueling field, strictly following the correct code of conduct. My husband must’ve fought a dozen times. . . (once) Benito came home without the bottom of one ear and with his shirt soaked in blood.”⁸³ His daughter remembers the young Mussolini was also constantly involved in scuffles with the local police: “He often returned home with his clothes crumpled and creased, his derby hat battered and dented by the clubbings he had received from policemen. . . I recall that, years later, after he came to power, a police officer requested an audience. Once inside my father’s office, the officer showed him an enormous truncheon and said in a quavering voice, ‘Your Excellency, would you do me the honor of accepting this gift? It is the club with which I often hit you at Forli during the demonstrations!’ ”⁸⁴

“During the First World War, when Mussolini served in the Italian Army as a frontline soldier against the Austrians, he was severely wounded”⁸⁵ by the accidental explosion of a mortar shell in his trench. Reports his daughter, “He kept a daily journal that he always carried on his person. This journal saved his life when a shell exploded at his feet and the book’s binding stopped one of the pieces, which would otherwise have pierced his heart.”⁸⁶

While in a military hospital, the future Duce had two memorable experiences. The first was a tempestuous clash between his common-law wife, Rachele, and a former Austrian mistress, Ida Dalser. As Rachele recalls, Dalser “. . . jumped on me, hurling insults and saying, ‘I am Mussolini’s wife. I am the only one who has the right to be with him.’ The other patients found this performance highly-amusing. I was furious. I lashed out with fists and feet and even began to squeeze my hands about her neck. Benito was so trussed up in bandages that he could hardly move, and, in trying to stop us, he fell to the floor. Luckily, the hospital staff intervened, or I would’ve strangled her.”⁸⁷ (Rachele decided to marry Benito, Edda reports, to forestall such a future scene, but the

husband-to-be wasn’t present, as he was “. . . bedridden in a military hospital with viral hepatitis. . . One of his friends, a music professor, Maestro Limenta, stood in as proxy. . . ”⁸⁸

The second in-hospital occurrence of note for Sgt. Mussolini’s future career was that he was visited by Italy’s King Victor Emmanuel III of Savoy, the monarch who appointed him to head his government in 1922 and removed him from power 21 years later. They’d met before, when Mussolini was in the hospital “being treated for paratyphoid.”⁸⁹

After the war, Mussolini suffered an auto accident in 1919. (His wife writes, “Though hurled for some yards, Benito escaped with only bruises and shock.”⁹⁰ Two years later, the now-budding Fascist politician crashed in a plane while taking flying lessons, suffering a broken knee.⁹¹

The Duce, his daughter remembers, was a “chicken-hearted” patient (as was her husband, Count Ciano):

“It has often been said that courageous men who confront danger and death without flinching are terrified of small bruises or minor illnesses. My husband was just like that. The moment he felt the slightest pain he believed that he was certainly going to die, and the slightest headache was instantly transformed by his imagination into a brain tumor. Once he even tried to convince me that a contagious illness could be caught on the telephone. I found this hilarious, especially since I had always felt that a little dust around the house was healthy because it inured one to microbes. When he felt ill, what a spectacle! And everyone knew of it, of that I can assure you.

“I don’t know which of the two, my father or my husband, was more of a mollycoddle. My father could not stand remaining in the room with someone who was coughing. He would immediately see the microbes spreading throughout the house, and when he was sick we were forbidden the threshold of his bedroom. He who had suffered the worst tortures when he had been riddled with shrapnel during the First World War, who had crashed in his plane, who had had one day been thrown from his car and who had fought so many duels, became stiff with terror when he had to have an injection—in fact, one time he stiffened so much that the needle broke! It was equally difficult to give him medicine, and I remember an incident that remained famous in the family annals.

“We were still living in Milan at the time, and my father had some medical treatment or other to follow. My grand-

mother, mother and I had to put on a real performance! My mother filled the spoon, held it out to my father, then we three opened our mouths and said, 'Ahhh!' while Papa swallowed the potion. I don't know what got into me that day, but seeing my father with his mouth gaping open in disgust after having taken the medicine, gave me the impulse to slap his face ever so lightly. We were both equally astounded by my gesture.

"My father looked at me severely, pointed to one of the corners of the room, and said in a curt voice, 'Stand in that corner for one hour!' . . . That was, I believe, the only time that someone in the family had ever dared to raise a hand against my father.

"I never would have dared to do such a thing to Galeazzo. First of all, I understood that I owed my husband too much respect to indulge in such a gesture; secondly, he would certainly not have exhibited the same gentleness as my father, but would have immediately slapped me back—and hard!"⁹²

(Both Mussolini and Ciano, Edda states, were rabid male chauvinists.)⁹³

Once, Rachele urged Benito to have an unsightly wart on the back of his head, near his neck, removed. "Count Pulle, a doctor friend, wanted him to have it removed. 'It's nothing, Duce,' he told him. 'It'll only take a few minutes. Have it removed. It's not nice to look at.' 'Nice or not, I don't care,' replied Benito. 'This wart is a great delight to my children and grandchildren. My greatgrandchildren will find it, too, if it stays where it is.'"⁹³ The Duce's wart remained.

Home Life of a Dictator

Rachele's first-person memoir is full of detail concerning the Duce's domestic moments. Once, before he headed the government, his friends carried him home drunk:

"As I struggled to undress him, he stared at me with a curious blank expression. Then, without warning, he

burst into life, shouting and raving like a lunatic obsessed with the madman's craving to smash. He began to break up the apartment furniture, our few pieces of china, even the mirror. Desperately, I woke a neighbor, and we called Dr. Bofandi . . . Between us we tied Benito to the bed, and to my relief, he gradually calmed down.

"On waking the following afternoon, Benito was quite bewildered, refusing to believe my account of what had happened. 'Look,' I shouted, pushing a pile of rubbish toward him, 'You've broken everything. It'll cost a fortune to replace it.' He said nothing, but just stared at the fragments of glass, china and wood. 'Get this into your head,' I said. 'I'll never agree to be married to an alcoholic. When I was little, I had an aunt who drank, and that was enough trouble. I admit you have your good qualities—and I'm even ready to forget about the other women—but if ever you come home again in that state, I'll kill you.' Benito heard me out without saying a word. Then, taking my hand, he led me to the bed where one-year-old Edda lay sleeping. 'I swear to you, on her head, that I'll never do it again' he said.

"I knew he'd keep his promise, because Benito was devoted to his daughter. He would rock her, spend hours watching her sleep and to wake her would sometimes play the violin over her bed. Indeed, apart from the times when he could not avoid sipping a little wine, Benito never again drank alcohol. That memorable night was the start of the Duce's legendary temperance."⁹⁴

She further notes that the Duce had a great deal of respect for the medical profession and, in 1932, enlisted its aid in getting rid of a rice surplus, and in boosting the births of Italian babies to increase future levies of soldiers.⁹⁵ His last mistress, Claretta (Clara) Petacci—who died with him in 1945—was the daughter of a doctor who was the personal physician to Pope Pius XI.⁹⁶ In July, 1943, upon leaving the King's residence after being dismissed as head of the Italian government, Mussolini was arrested and taken away in an ambulance,⁹⁷ and, again, in another one, on Aug. 28th, during his captivity. He hadn't been in an ambulance since his World War I wounding,⁹⁸ his widow relates.

The Cianos: Edda and Galeazzo

Edda, born Sept. 1, 1910, wasn't the Duce's only daughter; a younger daughter, Anna-Maria, had polio.⁹⁹ Like their famous father,

both daughters had rough-and-tumble childhoods. Once, as a girl, Edda cut her head from a fall, and was taken to a doctor for treatment. She recalls:

As soon as stitches were mentioned, my calm attitude abandoned me and I began dashing all over the room seeking escape . . . I fought so wildly that I kicked the doctor in the chin and, in the process of trying to protect himself, he split my brow open a bit more. Instead of *three* stitches, I had to have *six*, and it took the doctor longer to recover from the blows I had given him than it did for me to recover from my injury.¹⁰⁰

On Jan. 27, 1930, at age 19, she met the 27-year-old son of a prominent Italian Navy Admiral.¹⁰¹ She and the young Galeazzo Ciano were married that same year. The Duce's new son-in-law held several important positions in the Fascist regime during his career: as Italian Ambassador to Brazil, Argentina, China and the Vatican in Rome, and, between 1936-43, as Foreign Minister.¹⁰²

A notorious woman-chaser (a fact his widow readily-admits),¹⁰³ Ciano also enjoyed golf for relaxation, ate spaghetti until forced to go on periodic diets¹⁰⁴ and suffered from 1932 from asthma contracted in China until his more violent death 12 years later.¹⁰⁵

The Cianos were divided over Adolf Hitler's becoming Chancellor of Germany in January, 1933—she favoring it, he against.¹⁰⁶ Despite the Duce's later alliance with Hitler, Galeazzo Ciano—mirroring the views of most Italians—was against it, too, favoring the Western powers of Britain and France instead.¹⁰⁷

During late July, 1943—though ill with the flu¹⁰⁸—Ciano was one of the members of the Fascist Grand Council who passed a resolution of "no confidence" in the Duce's wartime leadership (which led to Mussolini's dismissal by the King and subsequent arrest). When the Duce was restored to partial power by his German allies, Galeazzo Ciano was arrested, tried for treason and executed by an Italian firing squad in January, 1944¹⁰⁹ (but not before—alá Hermann Goering two years later, at Nüremberg—he tried to take poison secured for him by a doctor. It failed to work, however.)¹¹⁰

Edda escaped to neutral Switzerland, where she began the process of publishing her husband's diaries in two volumes that revealed Galeazzo's opposition to his father-in-law's disastrous German alliance.

Today, Edda (who served as a nurse at Stalingrad in 1942¹¹¹) is 68.

MARYLAND MEDICAID & MEDICARE APPROVED

"Ronn Jaffe put me in my place"

Requirements: One, to facilitate seating 30 people in the relatively small waiting area, and, two, to layout the offices for efficient traffic flow.

Results: an office layout that works both esthetically and functionally. The waiting area seats more than 30 comfortably, has proven free of "traffic jams" and helps keep patients patient.

P. S. and using Ronn Jaffe Associates, saved 20%.

House Call

By RAYMOND J. DONOVAN, JR., MD

Dr. Donovan is Chairman of Med-Chi's Public Relations Committee and is affiliated with St. Agnes Hospital, Baltimore, MD.

House Call, the Faculty's very successful television program on general medical topics was seen over WBAL-TV, Channel 11, Baltimore from June 9-Sept. 16, 1977. The inspiration for the series came from a number of sources. Sydney King, WBAL's Public Affairs Director, offered to again use the Faculty in a summer replacement spot following the success of the alcoholism series presented in 1976. At the same time, the Public Relations Committee was in the process of reviewing programs offered for syndication. It was felt a program featuring Maryland physicians could be far more relevant to the community than a packaged program with physicians from other states.

Mr. King was responsible for the title. "We are offering our viewers an electronic house call," he said. A prominent part of every program was answering questions called in

by the viewers. A bank of telephones set up in the studio was ably answered by members of the Faculty's Auxiliary. They recorded viewers' questions and passed them to the physician expert.

I was pleased to act as host for the series, and looked upon the program not only as a public service, but as a chance to meet and exchange information with some of the finest physicians in our medical community. We had no trouble filling the 15 weeks WBAL offered, and could have continued much longer. Viewer response was extremely rewarding, averaging approximately 50 calls per show.

By far the most popular program was **An Overview of Modern Plastic Surgery**. Ronald Cameron, MD, a Bethesda Surgeon, treated the viewers to a series of before-and-after slides, and obviously whetted the interest in both cosmetic and reconstructive surgery.

William J. R. Dunseath, MD, got the program off to an excellent start talking about **Pimple Pickin'—Fact and Fancy**. While getting into some serious dermatological subjects, Bill had a few words for adolescent acne which, judging from the telephone calls, seems to affect an age group of 12-50.

The female physicians of our community were well-represented, beginning with Dr. Lois Young of the University of Maryland Hospital, who spoke particularly to parents on the problem of **Crossed Eyes: A Needless Handicap**. With the use of an intriguing model, she demonstrated some of the problems which occur in young children—particularly those which are correctable. She cautioned, however, that waiting too long for treatment may prevent success. Dr. Sandra Salan, a Howard County physician, gave the viewers a look into **Stroke: Prevention is the Only Cure**. She

Hours: Monday to Friday 11–5. Sunday 2–5

detailed the incidents which can lead to stroke and the viewers re-

sponded by an unusually large number of calls. Dr. Mary Betty

Stevens, of Good Samaritan Hospital, explored **Arthritis Facts and Fancies**. Although she could not speak of cures, she managed to reassure the audience arthritis is a disease with which one can live.

Richard Sarles was not so reassuring in his presentation **The Ups and Downs of Adolescence: How to Survive**. He declared parenting during adolescence the most difficult job in the world, although, somehow, parents and children both seem to manage. Scott Decker presented a less sanguine picture in his treatment of **The Broken Child**. With the use of slides, he detailed the battered-child syndrome and gave viewers much about which to be concerned.

I picked up a few pointers on my TV technique from John Tyson of Johns Hopkins as he joined the show for a discussion of **Risk/Benefits of Hormone Ingestion for Women of Child-Bearing Age**. Among his many careers, it seems John has been on stage most of his life: first, as a part of a performing family, and, during his medical career, as both host and participant on many similar programs. Although he spoiled our record for an all-amateur series, his contribution was indeed appreciated.

The constant ringing of telephones during Anthony Hammond's segment, **Ear, Nose and Throat Problems**, prompted the production staff to comment morning viewers seem much more interested in hearing than in sex. Hammond was aided in his presentation by a beautiful illustration executed by Mrs. Hammond for the program.

Sol Love, a Baltimore City dentist and member of the PR Committee, not only gave excellent pointers on **The Care and Feeding of your Teeth**, but also provided an address where viewers could write and have questions answered. He later reported a good response.

Dr. Joseph McLaughlin brought one of the best heart models to use in his segment on **You and Your Heart**, and viewers responded with enthusiasm to McLaughlin, who serves as Professor and Head of Thoracic and Cardiovascular Surgery at the University of Maryland.

TWO VIEWS OF THE HOUSE CALL SET, showing Drs. Donovan (left) and Phillip Byrd, a physician from St. Agnes Hospital, Baltimore. (Judy Buck photographs.)

Although his catheters and probes seemed pretty frightening at first, Rainer Engel enlightened viewers on **Urinary Tract Infections** without scaring them too much. In fact, extremely thoughtful questions, particularly about infections in young children, were received.

Phillip Byrd, a St. Agnes Hospital Radiologist, brought several films to illustrate the investigatory problems of his specialty. He traced for the viewers occluded vessels and broken bones.

A surprise to all of us was the response to the thoughtful presentation of J. Courtland Robinson, who shared his views on **Rape: A Crime with Health Consequences**. He detailed the progress over the years of handling rape victims, their interaction with the police and the changes in the law enforcement community. Viewers, however, made few calls during the program. Our best estimate was that rape is an interesting topic, but one people find difficult discussing.

We concluded the series with a program which was personally very rewarding. Dr. Theodore Woodward, Chairman of the Department of Medicine at University of Maryland, came to share with us some of his experiences with **Rocky Mountain Spotted Fever**, and infectious disease problems in Baltimore from the past. Dr. Woodward was a teacher of mine, and I knew he would enchant us all with his lively interest in historical medicine. It was a charming note upon which to end the program.

WBAL provided us with excellent assistance, and a most appreciative and helpful crew. Clayton Weaver and Joe Sullivan of the station alternated as program directors. Our floor managers were Henry Silverman and Bill Merryman. Taking an interest in the series, **Medical Economics Magazine** will have a one page feature story on House Call.

The program was a great experience for all of us who participated. Those who missed us each Thursday morning at 10, can see the program on video tape at the Faculty Library, or borrow tapes for home viewing. □

BELLS ARE RINGING, as **MRS. POLLY REITER** (top) and **MRS. GERRY HAMED** (bottom) answer incoming calls to the popular Med-Chi TV show.

Doctors in the News

Dr. Hoopes Elected ASPRS Secretary

Dr. John E. Hoopes of Hunt Valley, MD, has been elected Secretary of the American Society of Plastic and Reconstructive Surgeons. He was chosen during the 46th annual convention of ASPRS in San Francisco. Dr. Hoopes, an ASPRS member, is also affiliated with the American Association of Plastic Surgeons, the Plastic Surgery Research Council and the American Society for Aesthetic Plastic Surgery.

He is also certified by the American Board of Plastic Surgery.

Dr. Owens Serves on Bristol-Myers Award Panel

Dr. Albert H. Owens, Jr., Director of the Johns Hopkins Oncology Center in Baltimore (see *Journal* interview, p. 35, September, 1977) recently served as a panel member to determine the winner of the first

annual Bristol-Myers Award for Distinguished Achievement in Cancer Research, which was recently presented to Drs. James and Elizabeth Miller of the University of Wisconsin's McArdle Laboratory for Cancer Research. The panel consisted of five prominent, nationally-known cancer scientists.

Dr. Bianco Elected

Emidio A. Bianco, MD, was recently elected First Vice President of the Board of Trustees of Provident Hospital, Baltimore, by that Board. Dr. Bianco, formerly Director of Medical Affairs and Medical Education at St. Agnes Hospital and currently Director of Medical Affairs for Baltimore City PSRO, also was recently appointed a member of the Criteria Committee of the American Association of PSROs. This Committee will assist the National Council of PSROs to establish screening criteria for selected surgical diagnoses.

Tenuate®
(diethylpropion hydrochloride NF)

Tenuate Dospan®
(diethylpropion hydrochloride NF) controlled-release

AVAILABLE ONLY ON PRESCRIPTION

Brief Summary

INDICATION: Tenuate and Tenuate Dospan are indicated in the management of exogenous obesity as a short-term adjunct (a few weeks) in a regimen of weight reduction based on caloric restriction. The limited usefulness of agents of this class should be measured against possible risk factors inherent in their use such as those described below.

CONTRAINDICATIONS: Advanced arteriosclerosis, hyperthyroidism, known hypersensitivity, or idiosyncrasy to the sympathomimetic amines, glaucoma. Agitated states. Patients with a history of drug abuse. During or within 14 days following the administration of monoamine oxidase inhibitors, (hypertensive crises may result).

WARNINGS: If tolerance develops, the recommended dose should not be exceeded in an attempt to increase the effect; rather, the drug should be discontinued. Tenuate may impair the ability of the patient to engage in potentially hazardous activities such as operating machinery or driving a motor vehicle; the patient should therefore be cautioned accordingly. **Drug Dependence:** Tenuate has some chemical and pharmacologic similarities to the amphetamines and other related stimulant drugs that have been extensively abused. There have been reports of subjects becoming psychologically dependent on diethylpropion. The possibility of abuse should be kept in mind when evaluating the desirability of including a drug as part of a weight reduction program. Abuse of amphetamines and related drugs may be associated with varying degrees of psychologic dependence and social dysfunction which, in the case of certain drugs, may be severe. There are reports of patients who have increased the dosage to many times that recommended. Abrupt cessation following prolonged high dosage administration results in extreme fatigue and mental depression; changes are also noted on the sleep EEG. Manifestations of chronic intoxication with anorectic drugs include severe dermatoses, marked insomnia, irritability, hyperactivity, and personality changes. The most severe manifestation of chronic intoxications is psychosis, often clinically indistinguishable from schizophrenia. **Use in Pregnancy:** Although rat and human reproductive studies have not indicated adverse effects, the use of Tenuate by women who are pregnant or may become pregnant requires that the potential benefit be weighed against the potential risks. **Use in Children:** Tenuate is not recommended for use in children under 12 years of age.

PRECAUTIONS: Caution is to be exercised in prescribing Tenuate for patients with hypertension or with symptomatic cardiovascular disease, including arrhythmias. Tenuate should not be administered to patients with severe hypertension. Insulin requirements in diabetic mellitus may be altered in association with the use of Tenuate and the concomitant dietary regimen. Tenuate may decrease the hypotensive effect of guanethidine. The least amount feasible should be prescribed or dispensed at one time in order to minimize the possibility of overdosage. Reports suggest that Tenuate may increase convulsions in some epileptics. Therefore, epileptics receiving Tenuate should be carefully monitored. Titration of dose or discontinuance of Tenuate may be necessary.

ADVERSE REACTIONS: **Cardiovascular:** Palpitation, tachycardia, elevation of blood pressure, precordial pain, arrhythmia. One published report described T-wave changes in the ECG of a healthy young male after ingestion of diethylpropion hydrochloride. **Central Nervous System:** Overstimulation, nervousness, restlessness, dizziness, tremor, insomnia, anxiety, euphoria, depression, dysphoria, tremor, dyskinesia, mydriasis, drowsiness, malaise, headache; rarely psychotic episodes at recommended doses. In a few epileptics an increase in convulsive episodes has been reported. **Gastrointestinal:** Dryness of the mouth, unpleasant taste, nausea, vomiting, abdominal discomfort, diarrhea, constipation, other gastrointestinal disturbances. **Allergic:** Urticaria, rash, ecchymosis, erythema. **Endocrine:** Impotence, changes in libido, gynecomastia, menstrual upset. **Hematopoietic System:** Bone marrow depression, agranulocytosis, leukopenia. **Miscellaneous:** A variety of miscellaneous adverse reactions has been reported by physicians. These include complaints such as dyspnea, hair loss, muscle pain, dysuria, increased sweating, and polyuria.

DOSAGE AND ADMINISTRATION: Tenuate (diethylpropion hydrochloride): One 25 mg. tablet three times daily, one hour before meal and in mid-evening if desired to overcome night hunger. Tenuate Dospan (diethylpropion hydrochloride) controlled-release: One 75 mg. tablet daily, swallowed whole, in mid-morning. Tenuate is not recommended for use in children under 12 years of age.

OVERDOSAGE: Manifestations of acute overdosage include restlessness, tremor, hyperreflexia, rapid respiration, confusion, assaultiveness, hallucinations, panic states. Fatigue and depression usually follow the central stimulation. Cardiovascular effects include arrhythmias, hypertension or hypotension and circulatory collapse. Gastrointestinal symptoms include nausea, vomiting, diarrhea, and abdominal cramps. Overdose of pharmacologically similar compounds has resulted in fatal poisoning, usually terminating in convulsions and coma. Management of acute Tenuate intoxication largely symptomatic and includes lavage and sedation with a barbiturate. Experience with hemodialysis or peritoneal dialysis is inadequate to permit recommendation in this regard. Intravenous phenolamine (Regitine®) has been suggested on pharmacologic grounds for possible acute, severe hypertension, if this complication of Tenuate overdosage.

**Whether overweight is a
complicating factor...
or just uncomplicated overweight.**

Tenuate[®] Dospan[®] ^{IV} **(diethylpropion hydrochloride NF)** **75 mg. controlled-release tablets**

A useful short-term adjunct in an indicated weight loss program.

Overweight patients in certain diagnostic categories often require strict obesity control. Diethylpropion hydrochloride has been reported useful in obese patients with hypertension, symptomatic cardiovascular disease, or diabetes. While it is not suggested that Tenuate in any way reduces these complications in the overweight, it may have a useful place as a short-term adjunct in a prescribed dietary regimen. (Tenuate should not be administered to patients with severe hypertension; see additional Warnings and Precautions on the opposite page.)

In uncomplicated obesity.

Many patients, on the other hand, present with excess fat but no disease. While this condition is often termed uncomplicated obesity, complications of both a social and a psychologic nature may be distressingly real for the patients. In these cases, a short-term regimen of Tenuate can help reinforce your dietary counsel during the important early weeks of an indicated weight loss program.

Clinical effectiveness.

The anorexic effectiveness of diethylpropion hydrochloride is well documented. No less than 16 separate double-blind, placebo-controlled studies attest to its usefulness in daily practice.¹ And the unique chemistry of Tenuate provides "... anorexic potency with minimal overt central nervous system or cardiovascular stimulation."² Compared with the amphetamines, diethylpropion has minimal potential for abuse.

**Tenuate—it makes sense.
And it's responsible medicine.**

A Modern Use for Chloroform?

By JEAN-MAURICE POITRAS, MD, FAAP

Dr. Poitras can be contacted for reprint and other data at 107 Edgerton Rd., Towson, MD 21204.

•
The other day in a little bookshop in upstate New York, I found an interesting book by Arthur Ernest Sansom, MB, London (Late House Physician and Physician's Accoucher's Assistant to King's College Hospital). The book was published in 1865 and entitled '**Chloroform, Its Actions and Administration.**'

I perused the book and was amazed at the knowledge displayed by the physicians of over 100 years ago; however, an item of even greater interest attracted my attention, which I felt deserved the attention of my fellow Maryland physicians as well. It was a newspaper clipping, yellow and frayed with age and falling apart, which a former reader had left ensconced between the pages of this little volume.

The item was a letter to the editor of the **Tribune** dated Jan. 15, 1895. Herewith, is an exact copy of the letter: Is more comment necessary?

CHLOROFORM IN ACCIDENTS: Dr. Wilder Urges That It Be Kept On Hand to Obviate Agonizing Deaths

To the Editor of The **Tribune**:

Sir: In your issue of the 13th under the heading 'Roasted to Death', is described the following accident: On Staten Island Saturday night an explosion caused the wreck and burning of two frame houses. From one there barely escaped a mother and four children. In the ruins of the other was caught a man, who was literally roasted to death before the eyes of hundreds of spectators. Many were made sick; none can ever forget wholly the sight or cease to hear his frantic cries for the help that could not

be given. Rescued he could not have been, perhaps, without tools and mechanism more powerful than were available at short notice in a small place.

But though death was inevitable and came upon him rapidly, its attendant horrors might have been averted. Had there been at hand two ounces of chloroform, a handkerchief, any cloth, or a soft hat could have been saturated with it and pushed under the victim's face. His hands were imprisoned, but a stick, cane or umbrella could have kept the anesthetic in place even after the flames had driven his would-be rescuers away.

But where was the merciful drug? Among all who stood horror-stricken, eager, yet powerless to save, had no one heeded the suggestion offered in the **Tribune** two years ago, soon after the railway wreck at Battle Creek, MI, when a child and a woman were in like manner "roasted to death?" Did no hip pocket contain in place of pistol or whiskey-flask the vial of chloroform? Perhaps each who may have thought of so providing himself took for granted that somebody would do it. Yet none can foresee how soon he may be one of only a few spectators of such a calamity, or even be himself the victim.

Consider the following record. On the dates given were described in the **Tribune** instances in which chloroform might have prevented the bodily suffering of one or more and the scarcely less terrible mental agony of witnesses: In 1882, Jan. 13 at Spuyten Duyvil were burned Sen. Wagner and others; in 1889, May 1, Oct. 17, Nov. 19; in 1890, Jan. 18, March 4; in 1891, July 4, July 28, August 7; in 1892, May 2, Sept. 22, Nov. 11; in 1893, Apr. 21, Aug. 28, Oct. 27, Nov. 20, Nov. 30; in 1894, Jan. 26, Aug. 13, Sept. 11, Sept. 12, Oct. 17; in 1895, Jan. 19.

In commenting on the Battle Creek disaster, I suggested that a metal can of chloroform be carried on every railway car, and that policeman be supplied with it for various purposes, specified and more or less obvious. Why not also all fire-engines, drugstores and liquor-saloons? Of course, all druggists keep it, but not always in a place and available for emergencies. Let the licensed dealer and retailer of spirits require the keeping of chloroform in plain view. In the present case, it is said that one of four who tried to extricate the victim was a "liquor-dealer whose place was close by." In civilized parts of the world, such establishments are seldom far off. Let their proprietors atone for the many woes to which they contribute by furnishing the blessing supremely demanded under certain conditions, euthanasia. So to save another from fiery fortune in this world shall perchance diminish their own commonly-merited similar torments in the other.

Two practical points must be borne in mind. The other familiar anesthetic is ether, and some might naturally substitute it for chloroform. But it is less prompt and highly inflammable so that it would only feed the flames. While the vapor of chloroform is suffocating, anesthetic and,—if carried to excess, as a liquid it is a powerful irritant of the skin and mucous membranes; hence, it should not be permitted to reach the eyes or lips.

This capacity for vigorous irritation of mucous surfaces, however, renders chloroform invaluable for certain other purposes named in my former communication and in a brief note printed on March 2, 1894. Poured upon the nostrils of a fighting dog or other animal it compels him to let go and depart. There have been already several incidents like that described in **The**

Tribune of June 11, 1894, under caption **Bitten by Her Pet Lion**. Allowing for some exaggeration, two things are certain: first, there is real considerable danger in the exhibition of trained lions and tigers; second, when the exhibitor is attacked the immediate effect of clubbing or prodding is to increase the rage of the beast and correspondingly the peril of the man, as is illustrated whenever the same crude methods are directed against fighting dogs. To be effective, therefore, these methods almost surely impair the appearance and disposition of a very costly piece of property, and are by no means easy to employ without injury to the man. If such exhibitions are to continue at all (and their influence and possibilities link them closely to bullfights), then the law, if not the self-interest of the proprietors, should enforce the provision of chloroform in considerable quantities with apparatus for projecting it forcibly as a coarse spray. The man attacked should shut his eyes and a well-trained at-

tendant should be able to avoid him. The advantage of chloroform over ammonia is that it is much safer to handle and its effects are much less likely to cause permanent injury, even to the eyes. It seems to me preferable even in so desperate a circumstance as the following: near Budapest, about Dec. 1, 1894, a party was attacked at night in the forest by wolves and 13 "dragged down and devoured." I verily believe that if travellers in wolf-infested districts were provided with not only firearms, but the means of projecting a stream of chloroform, the fiercest wolves might be kept at bay.

Let me close with the mention of some other cases of chloroform. For more than 20 years, I have at intervals advocated its employment as a lethal agent for condemned animals and criminals and by inexorable suicides. As reported Jan. 5, it was used by the Mayor of Detroit for killing two superannuated horses. At Cornell University are thus disposed of painlessly each year about 400 cats besides many

other creatures. The commendable sentiments that have led to the substitution of the electric chair for the halter in the State of New York should logically prefer chloroform to either. Properly administered, it is one of the sheet-anchors of medicine and surgery. In overdoses and persisted in beyond a certain limit it, of all known agents, destroys life, "tuto, cito jucunde et parvo pretio." Ithaca, NY, Jan. 15, 1895

Dr. Borkovich Selected "Internist of the Year"

Dr. Katherine H. Borkovich, a Baltimore physician, was selected "Internist of the Year" by the American Society of Internal Medicine recently. The award was made public at the 22nd Annual Meeting of the Society held in San Francisco.

Dr. Borkovich has many firsts in her distinguished career, having served as the first woman president of the Maryland Society of Internal Medicine and the Baltimore City Medical Society; the first woman staff representative of the Medical Board of the Johns Hopkins Hospital and the first Secretary-Treasurer of the Section on Internal Medicine of the Baltimore City Medical Society. She

serves on the Council of the Medical and Chirurgical Faculty, has been President of the Johns Hopkins Women's Alumni Association, Member of the Board of Trustees of the Heart Association of Maryland and is a member of the American Medical Association.

Dr. Borkovich was a prime mover in the development of quality of care review mechanisms in Maryland through her efforts in the formation of the state medical society's Peer Review Committee. These activities have been extensively copied in other states throughout the country. She has also worked with the Maryland Blue Shield Utilization Review Committee and with the Baltimore City Professional Standards Review Organization.

Dr. Borkovich, a native of Monaca, PA, is a Board-Certified Internist subspecializing in Cardiology and has practiced and lived in Baltimore since she received her Medical Degree from the Johns Hopkins University School of Medicine in 1939. Her many interests include membership in the Natural History Society of Maryland, the National Audubon Society and the American Forestry Association, the Sierra Club, the Adirondack Mountain Club, the fishing Club of America and the National Travel Club.

Neurologic Complication of Massive Doses of Penicillin G in the Obstetric-Gynecologic Patient

By H. MELVIN RADMAN, MD

For reprint and other data, contact Dr. Radman at 3601 Clarks Lane, Balto., MD 21215.

The availability of and the reputed safety of the newer types of penicillin has fostered the intravenous use of massive dosage in some type of obstetric and gynecologic patients. The spectre of complications associated with septic abortion, infected postpartum patient or in those who have had a tubo-ovarian abscess or who become infected after a gynecologic operation has been responsible for the administration of large doses of antibiotics by the intravenous route. However, attention must be directed to the possibility that complications from the treatment may prove to be equally as hazardous as the original disease.¹⁻³

Johnson and Walker in 1945¹ were among the first to demonstrate some of the untoward neurologic reactions to penicillin when that drug was given intrathecally for the treatment of meningitis. More recently, Weinstein et al.² in a study of the effect of large doses of penicillin G in infection, concluded that serious hazards may be encountered when they are used intravenously. Those reactions are central nervous system irritation and hyperkalemia. Where there is decreased kidney secretion that stems from infection, the possibility of the development of epileptiform seizures must be considered because of the resultant high spinal fluid level. Under such conditions the half life of the antibiotic is prolonged, and the quantity of the drug must be drastically reduced.

The importance of the control of infection in the obstetric-gynecologic patient has been emphasized since the time of Semmelweis, Holmes and Lister and most recently by Ledger.⁴ The discovery of antibiotics has proved to be a boon to the parturient woman as well as those with pelvic infection. When urinary suppression accompanies the septic process, the judicious use of penicillin becomes a necessity and a paramount issue in the recovery of the patient.

Although these facts are comparatively well-known in the surgical and medical fields, their relationship to the infected obstetric-gynecologic patient has not been emphasized. It, therefore, becomes important to record some of the details in the case report that follows.

Case Report: Miss C. B., age 18, para 0, entered the hospital for a therapeutic abortion for sociopsychic reasons. Because of the irregularity of her periods and equivocal physical and laboratory findings, it was difficult at first to establish her pregnancy. However, a serum pregnancy test three weeks prior to hospital admittance was positive. Her general somatic status was good. Under general anesthesia, the uterus was evacuated by both aspiration and curettage. Approximately 48 hours after discharge from the hospital, she had

chills, elevation of temperature and abdominal pain. When seen two days later, she had a fever of 101° F and pulse rate of 100. Although she did not appear to be gravely-ill, she was in moderate discomfort. The somatic status was good and the positive findings were limited to the lower abdomen and pelvis. The uterus was enlarged to about three cm. below the umbilicus. There was marked tenderness and some spasm over the whole lower abdomen. On pelvic examination, the cervix was open and exuded a purulent exudate.

The uterus was enlarged and tender, as previously described. A uterine and cervical culture subsequently proved to be negative for *Bacillus Welchii*. Intravenous fluids were started to which were added three units of oxytocin. In addition, 10 million units of penicillin G were given intravenously every six hours. By mid-afternoon, six hours after admittance, she expelled macerated and foul-smelling elements of the products of conception. The temperature which had risen to 104° F now fell to within normal limits. Vaginal bleeding became very active and the inability of the blood to clot was noted. Blood pressure fell and she was in borderline shock. Because of the hemorrhage and clot deficiency, two units of whole blood and one unit of fibrinogen were given.

Evidence of hypofibrinogenemia continued and because of concern in regard to intravascular clotting, 75 mg. of Heparin was given. The continued bleeding precipitated the necessity of further uterine exploration and, consequently, 12 hours after hospitalization, a curettage was done under general anesthesia. Central venous pressures were initiated to monitor her condition and two additional units of blood were given. At this point, the clotting deficiency had been corrected. While the initial urinary output was satisfactory, she became oliguric six hours after first observation, excreting two-four cc. of urine per hour. There was no improvement despite the administration of Mannitol and Ethacrynic acid. The patient became increasingly edematous and both blood urea and creatinine began to rise, although the potassium remained within normal limits. Fluid intake was limited, reverse isolation was established, but intensive intravenous penicillin was continued. Within 24 hours, she had a severe convulsion which was controlled by Dilantin and phenobarbital. Peritoneal dialysis was done with marked improvement in the edema, a diminution of the urea and creatinine levels, but with no effect upon the oliguria.

The intravenous penicillin had been reduced so that she received 1/3 of the original dose. Peritoneal dialysis was repeated in one week because of continued oliguria and edema and another rise in the blood urea and

creatinine. However, in the third week she began to diurese copiously. The secondary anemia was treated with one unit of packed cells and oral preparation of iron. In the fourth week, she was entirely well with no edema, no evidence of urinary tract infection, the pelvic disease under control, improvement in the secondary anemia and return of the blood urea and creatinine to normal levels. At the end of this week, she was discharged from the hospital as well.

Discussion

Since Johnson and Walker in 1945 demonstrated the dangers of large doses of intrathecally-administered penicillin G, several investigators have substantiated their observations. The obstetric patients who have had a septic abortion or a severe postpartum infection are prime candidates for massive doses of intravenous penicillin. This is also true of women who have become infected following gynecologic procedure or who have had a ruptured tubo-ovarian abscess. Generally this type of treatment is effective in controlling the disease, along with other supportive measures. Should urinary suppression become a complication, a judicious appraisal of the therapy must be made in order to avoid central nervous system sequelae. The case report is presented to emphasize the fact that although known in other fields of medicine, the neurotoxic effects of large doses of intravenous penicillin G when given to patients with oliguria may be dangerous.

Variable Resistance of Shigellae to Ampicillin Within a Single Community

By ELLEN R. WALD, MD; ARNOLD WALD, MD; PATRICIA CHARACHE, MD and RAY R. ARTHURS, BS

Dr. Ellen Wald is Assistant Professor of the Departments of Pediatrics and Medicine at the University of Maryland Hospital; Dr. Arnold Wald is Assistant Professor in the Department of Medicine at Baltimore City Hospitals; Dr. Charache is Associate Professor in the Departments of Laboratory Medicine and Medicine at the Johns Hopkins Hospital and Mr. Arthur is Assistant Laboratory Manager of the Department of Laboratory Medicine at Johns Hopkins Hospital. Address reprint requests to the Dept. of Pediatrics, University of Maryland Hosp., 22 So. Greene St., Balto., MD 21201.

Introduction

A review of Shigellae isolations in three major hospitals in Baltimore reveals important intracity differences in susceptibility to ampicillin. Susceptibility tests were performed either by the agar dilution method or by the Kirby-Bauer technique; 23 strains were assessed by both methods with agreement in susceptibility designation. In Baltimore, the overall mean rate of resistance of Shigellae to ampicillin was 40% with a range from 6% to 53%.

Emerging antimicrobial resistance of Shigellae isolates has resulted in frequent changes in therapeutic recommendations. An awareness of current resistance patterns is important as a guide to appropriate initial therapy in those cases where antimicrobials are indicated. The efficacy of appropriate antibiotic therapy in shigellosis has been repeatedly demonstrated¹ and is only deferred in those cases where the risk of toxicity of the treatment regimen exceeds the risk of the untreated disease.²

An increasing number of multiple drug-resistant Shigellae isolates have been reported from a number of geographic areas within the United States, including Washington, DC,³ Kansas,⁴ Connecticut,⁵ New York,⁶ Texas,⁷ Michigan⁸ and Georgia.⁹ Baltimore's proximity to Washington, DC, where 95% of isolates of Shigellae were reported resistant to ampicillin in 1971, prompted us to review the resistance patterns of Shigellae in Baltimore.

FIGURE 1: Number of isolates of S. Sonnei by month at UMH.

Materials and Methods

All the strains of Shigellae in this study were isolated from infants, children or adults who were outpatients at the University of Maryland Hospital (UMH), Baltimore City Hospitals (BCH) or the Johns Hopkins Hospital (JHH) during the period July, 1974 through December, 1975. These organisms were confirmed to be Shigellae by the Maryland State Health Department Laboratory and consisted of 126 isolates of *S. sonnei*, 1 *S. dysenteriae* and 16 *S. flexneri*. Susceptibility tests were performed by the Kirby-Bauer technique (UMH and BCH), by agar dilution technique (JHH) or by both methods. In the Kirby-Bauer technique, the isolate was plated on Mueller-Hinton agar and high content antibiotic discs were employed. Interpretation was on the basis of the size of the zone of inhibition. Sensitivities to ampicillin (10 mg.), carbenicillin (50 mg.), cephaloridine (30 mg.), chloramphenicol (30 mg.), kanamycin sulfate (30 mg.), tetracycline (30 mg.), dihydrostreptomycin sulfate (10 mg.) and colistin sulfate (10 mg.) were determined.

The agar dilution method used is the reference standard method,¹⁰ using a Steers replicator, Mueller-Hinton agar at 4 mm. depth of medium and 104 organisms per inoculum site.

Results

One hundred and forty-three strains of Shigellae obtained from three large medical centers in Baltimore were compared with respect to susceptibility to ampicillin. Resistance to ampicillin was not observed in the single isolate of *S. dysenteriae* or in the 16 *S. flexneri*. When the three institutions are observed individually, the rate and pattern of resistance among *S. sonnei* strains have been shown in the figure from UMH, BCH and JHH. At UMH, 6% of strains were resistant; at BCH, 43% were resistant and at JHH, 53% were resistant to ampicillin. When all the *S. sonnei* isolates are taken together, the rate of resistance was 40%. The

FIGURE 2: Number of isoates of S. Sonnei by month at BCH.

susceptibility of 23 strains (obtained from UMH and BCH) of *S. sonnei* to ampicillin were assessed by both Kirby-Bauer and agar dilution methods; there was agreement in susceptibility designation for each isolate.

Discussion

Reports of Shigellae that are multiply drug-resistant have come from many institutions in the US,^{3-5,8-9} as well as abroad.¹¹⁻¹² However, reports of local differences in antibiotic resistance patterns within a region or city have been infrequent. A report from Michigan,⁸ which represented the accumulation of Shigellae isolates from 30 different counties, noted increased antibiotic resistance from the most urban part of the state. Neu et

al⁶ examining Shigellae isolates from New York City found ampicillin resistance rates to vary between 25-67% as determined by the geographic location of the municipal hospital. All other reports represent an experience at a particular hospital or institution. It is important to recognize that the experience of one institution may not be an accurate reflection of the pattern in the surrounding community.

Summary

An examination of the patterns of Shigellae resistance over an 18-month period in Baltimore revealed impressive differences at the three major inner city hospitals. Although the overall mean rate of ampicillin resistance of Shigellae was 40%, the incidence of resistance ranged from a low of 6% at the UMH to a high of 53% at JHH. An awareness of highly-localized difference is necessary as a guide to appropriate initial therapy in those cases where antimicrobial therapy is indicated.

181st Annual Meeting
MEDICAL AND CHIRURGICAL FACULTY OF THE STATE OF MARYLAND
MAY 2-4, 1979
HUNT VALLEY INN, HUNT VALLEY, MD

SCIENTIFIC EXHIBIT APPLICATION

Scientific exhibits are an integral part of the Annual Meeting. All physicians, medical institutions and organizations having an appropriate exhibit are urged to complete the application below for consideration by the Exhibit Subcommittee.

PLEASE INDICATE THE CATEGORY OF EXHIBIT:

- ☐ **SCIENTIFIC EXHIBIT:** Result of original scientific research which involved the personal contribution of the exhibitor. Its purpose is to advance medical knowledge. It should not be designed for the personal, financial gain of the exhibitor.
EXHIBIT FEE: Waived.

- ☐ **CLINICAL DISPLAY EXHIBIT:** Must be of a scientific nature, but not necessarily original research. The exhibitor need not be personally involved in the research. The exhibit should contribute to the advancement of knowledge of other members of the profession, but it may also contribute to the personal, financial gain of the exhibitor.

EXHIBIT FEE: \$150 for each 6' by 10' space.

- ☐ **EDUCATIONAL:** Any exhibit of a scientific and non-commercial nature which does not fit into either of the above two categories. Included would be voluntary health organizations and local and State agencies.

EXHIBIT FEE: \$60 for each 6' by 10' space.

PLEASE COMPLETE AND SUBMIT BY JAN. 31, 1979

Chairman, Subcommittee on Exhibits

ANY SPECIAL REQUIREMENTS NOT COVERED IN THIS FORM

HAS EXHIBIT BEEN SHOWN AT OTHER MEDICAL MEETINGS?

PLEASE ATTACH A 50-WORD DESCRIPTION OF EXHIBIT.

RULES GOVERNING SCIENTIFIC EXHIBITS

The following rules govern the selection and conduct of scientific exhibits:

1. Each exhibitor shall be fully responsible for the content, arrangement, presentation, setting up and dismantling of his exhibit.
2. Cost of transportation of exhibit to and from the meeting must be borne by the exhibitor.
3. The Medical and Chirurgical Faculty will provide a back-drop and side rails for the booth, 500-watt electric current outlet, one covered table and two chairs.
4. MOTION AND SOUND MAY BE USED ONLY IF THEY

DO NOT DETRACT FROM OTHER EXHIBITS, DISTURB THOSE IN ROOM OR INTERFERE WITH TELEPHONES.

5. No reference to, or credit for, financial aid shall be shown on the exhibit.
6. Only generic names may be used, and shall not exceed ONE inch in height. NO TRADE NAMES are permissible.
7. Each exhibit should be manned at all times by someone thoroughly familiar with its content.
8. Exhibitors are urged to discuss their displays and work with the physicians and students.
9. The Medical and Chirurgical Faculty reserves the right to approve or reject any exhibit without recourse.

Medical Annals of Maryland, 1899-1925

L. H. MILES, Managing Editor

Maryland State Medical Journal
1971-74

Pre-1932 Surgery

By ALEXIUS McGLANNAN, MD

Editor's Note: Born at Baltimore on July 24, 1872, Dr. McGlannan received his MD from the University of Maryland in 1895. He served as President of the Medical and Chirurgical Faculty in 1929. A specialist in Surgery, he had offices at 115 West Franklin Street, Baltimore, when this article was written in 1932. He died at Baltimore February 25, 1940.

Early Developments

Up to 1925 surgery was marked by development of the surgical specialties. Laryngology, Neurosurgery, Orthopedics, Urology, and other branches have grown and expanded to a remarkable degree.

Modern surgery has progressed on the principles of asepsis and anesthesia. Present-day aseptic technique, in large measure, developed in Baltimore under the leadership of Dr. W.S. Halsted. The use of the rubber glove, originally devised to protect the sensitive skin of the operating room nurse, was extended to the assistants and then to the surgeon to overcome the necessarily imperfect disinfection of living skin. The short sleeves of the sterile operating gown were lengthened so that the cuff was covered by the glove. A face mask was added to limit the probability of droplet infection from the mouth. And in the earlier years of the century, when hirsute adornment was more or less the mark of the surgeon, a special sterile covering encased the beard.

Suits made of washable material, usually white, replaced the street clothing or the morning or evening dress affected by the surgeons of pre-antiseptic days, and a washable cap or other form of head gear covered the scalp of all taking part in the operation.

Today such is the armor of the surgeon all over the world, and the picture of an operating room in action shows slight variations whether the scene is in the Congo or in Maryland.

Anesthesia

The debate on the relative merits and dangers of ether and chloroform was still in progress in 1900. The disadvantages of both led to the adoption of nitrous oxide-oxygen and ethylene oxygen as substitutes or adjuvants to the older agents. Later, tribromethanol (avertin) and various barbital compounds were introduced, but, at the present time, the use of these drugs is limited to their employment preliminary to the administration of some other anesthetic.

The search for a safe and pleasant method of an-

esthesia stimulated the study of local analgesic agents. Halsted was a pioneer in this investigation. He developed infiltration anesthesia to a wide degree and created conduction anesthesia, infiltrating and bathing the nerve fibers with cocaine and similar drugs. In 1922, the National Dental Association presented Dr. Halsted with a gold medal, "in recognition of his original researches and discoveries upon which the technique of local and neuroregional anesthesia in oral and dental practice now rests."

Dr. Harvey Cushing and Dr. James F. Mitchell, pupils of Dr. Halsted, did much to spread the knowledge and practice of local anesthesia.

Abdominal Surgery—Penetrating Wounds

Immediate intervention in abdominal catastrophes was not universally agreed upon as the best practice in 1900. Dr. Randolph Winslow reported a series of cases of gunshot wounds of the intestine, treated by immediate operation. Discussing this paper, Dr. W.B. Coley said: "This is the highest percentage of recoveries with which we are familiar."

Perforation of Intestine

Cushing advocated prompt operation under infiltration anesthesia in cases of perforation of typhoid ulcers. He made a distinction between the progress of the peritonitis in cases of slow perforation of the appendix where adhesions limit the process and those of the ileum where the anatomical relations are less favorable.

Appendicitis

The literature of the early years of the century is rich in references to appendicitis. Kelly and Hurdon's book on the appendix and its diseases is one of the most valuable contributions to this important subject.

Stomach

Pyloroplasty, as devised by Dr. J.M.T. Finney, is a valuable method for dealing with peptic ulcer and benign pyloric obstruction. By means of this operation, the obstruction is relieved without disturbance of the physiology of digestion. Hughson's experiments on the effect of vagus neurotomy on the pyloric sphincter are important in the study of diseases of the digestive organs.

Cushing published a method for sterilizing the contents of the stomach by disinfecting the mouth and the use of sterile food preliminary to operations on the upper gastrointestinal tract.

Biliary Tract

Halsted was the first American to operate on the common bile duct and made many contributions to the surgery of the biliary tract. His last one was the drainage of the common duct by means of a tube passed through the cystic duct.

Pancreatitis

Dr. Eugene Opie showed the relation between biliary obstruction and acute hemorrhagic pancreatitis.

Resection of the Pancreas

Finney and Finney, Jr. successfully resected the pancreas for the relief of hyperinsulinism.

Peritoneal Vaccines

The development of vaccines against peritonitis had its onset, in part at least, in Halsted's experiments in which he inoculated the peritoneal cavity of animals with pure cultures of staphylococcus aureus. The experiments proved that the presence of a foreign body in addition to the bacteria is necessary for the development of peritonitis.

Hernia

The probability of curing inguinal hernia by surgical operation is shown in Bloodgood's report on Halsted's operation. This report is of great interest, not only because it was the most careful report on the radical cure of hernia published at that time, but also because it was the first paper to record the value of rubber gloves in aseptic technique. Bloodgood, beginning in 1896, was the first operator to wear rubber gloves as routine practice in all clean operations.

In later development of the hernia operation, Halsted brought out the method of utilizing the cremaster muscle and the rectus sheath for the cure of the more difficult forms of this lesion. McArthur made use of strips of the aponeurosis of the external oblique muscle and later Gallie transplanted strips from the fascia lata in order to close hernial openings with living tissue. Dr. Amos Kuntz has had success using preserved animal fascia for the same type of operation.

Dr. Randolph Winslow successfully closed an ectrophy of the bladder in a female child. Nearly 30 years later he was able to report on her condition. She had just been delivered of her fourth child, and was a well-nourished, healthy woman, able to perform her household duties in a satisfactory way.

Intestinal Obstruction

The search for the lethal agent in acute intestinal obstruction has led to many interesting experiments. Whipple, Stone and Berheim, working with dogs, showed that the material which accumulated in closed duodenal loops, when injected into other healthy dogs, caused their death.

Blood Vessels

Halsted performed the first successful ligation of the first portion of the left subclavian artery, and also the first excision of a subclavian aneurysm. "His best paper seems to be that on the Ligation of the Left Subclavian Artery," McCallum stated. His interest in the surgery of the large vessels led to the development of his metal bands for the partial occlusion of an artery for the cure of aneurysm. By experiment, he determined the cause of aneurysm of the subclavian artery associated with cervical rib.

Dr. Dean Lewis studied the collateral circulation of the lower extremity in cases of thrombo-angiitis obliterans, adding to the knowledge of the course of this disease as well as to the methods for its treatment.

Ductless Glands

Halsted's early experimental work on the thyroid is reflected in his monograph, *The Operative Story of Goitre*, published in 1920. In the course of his work, he brought out the relation of the thymus and thyroid in certain cases, and the possibility of transplanting the parathyroid glands for the prevention of tetany. He demonstrated that a parathyroid transplant one quarter of a millimeter in diameter maintained a dog in good health. He also proved that a deficiency must exist in order that the transplantation of these glands be successful.

Dr. Harvey Cushing's experiments and discoveries relating to the pituitary gland will be discussed elsewhere in this volume.

Suprarenal

The relation of tumors of the suprarenal to hypertension is of great interest; this interest is intensified by the report of a tumor of the medulla of the suprarenal successfully removed by Shipley.

Malignant Tumors

The American Society for the Control of Cancer was organized in 1913 for the purpose of bringing to public attention the dangers of tumors in the hope that education would lead those afflicted with malignant tumors to seek relief at a time when there is greater probability of cure. Most of the statistics on which the original propaganda of the society was based came from the laboratories of surgical and gynecological pathology under the direction of Drs. Bloodgood and Cullen.

Cancer of the Breast

Halsted's original contribution to this subject, practically contemporaneous with that of Willy Meyer of New York, was followed by a series of reports in which the results were carefully recorded. Gradually, the operation was taken up by other surgeons; and at this time, it is in universal use. Many modifications have been devised, but the underlying principle remains. Dr. Halsted made few changes in the details of the operation. The extent of skin removed was increased rather than diminished, and the dissection of the neck was abandoned as a routine practice.

Bone Tumors

In the early days of the Roentgen ray, Baetjer and Bloodgood studied the bone specimens in the laboratory of Surgical Pathology of the Johns Hopkins Hospital by this means of investigation, and correlated their findings with the clinical history of the patient and the pathological characteristics of the bone tumors. This study proved that operation in cases of bone tumors should vary according to the character of the tumor, that amputation is not always necessary, and that exarticulation at the highest joint is only indicated in the most malignant forms of sarcoma, or in other less malignant sarcomata on account of their position near the joint or their infiltration of soft parts.

The recent publication of Geschickter and Copeland is a valuable contribution to our knowledge of bone tumors.

Roentgen Ray

The medical profession was prompt in recognizing the usefulness of Roentgen's discovery. Soon after his announcement of the properties of the X-ray, in December, 1895, Roentgen laboratories were established and became an indispensable part of active hospitals. Such laboratories were opened in Baltimore without delay, one of the first being that of Dr. Christian Deetjen.

In one of the early reports on the use of the X-ray in clinical surgery, we find Dr. Louis McLane Tiffany's report of a chisel imbedded in the nasopharynx. The position and character of the foreign body were recognized by means of the X-ray examination and Dr. Tiffany, by an ingenious operation, was able to remove the chisel. The patient made an uneventful recovery.

With the establishment of Roentgen laboratories, a new specialty began to emerge and the skillful skiagraphers of 1900 have developed into the Roentgenologists of today.

Plastic Surgery, Skin Grafting

Plastic surgery has developed into a special field of surgery.

Skin grafting remains of interest and importance to the general surgeon. Dr. John Staige Davis invented the small deep graft more popularly known as the pinch graft, a most useful method of skin grafting.

Teaching

Teaching is a prominent characteristic of Maryland surgeons. From the time of Davidge, who is responsible for the organization of the Medical College of Maryland, the forerunner of the University of Maryland, the fifth medical school in the United States, surgeons have taken an important part in the development of medical education.

At the turn of the 20th Century, the professors and associate professors of Surgery in Baltimore were these doctors:

C.F. Bevan, College of Physicians & Surgeons; J.D. Blake, Baltimore Medical College; Jos. O. Branham, Maryland Medical College; J.W. Chambers, College of Physicians and Surgeons; J.M.T. Finney, Johns Hop-

kins University; W.S. Halsted, Johns Hopkins University; A.C. Harrison, College of Physicians & Surgeons; Frank Martin, University of Maryland; L.M. Tiffany, University of Maryland; I.R. Trimble, College of Physicians and Surgeons; R.B. Warfield, Baltimore Medical College; and Randolph Winslow, University of Maryland.

The most prominent member of this group is Dr. Halsted. The extent of his contributions is indicated by the references to his work in this review. He developed a new school of surgeons; his influence on the practice of surgery has been carried to all parts of the world by his pupils and remains an inspiration for those who practiced in Baltimore during his lifetime. Dr. Halsted died Sept. 27, 1922.

The professorship of Surgery in the Johns Hopkins is a full-time position. Dr. J.M.T. Finney successfully carried on the work as chief of the surgical department until a successor for Dr. Halsted was found in Dr. Dean Lewis, who came to Baltimore from Chicago in 1925.

As a result of mergers, the number of medical schools in Baltimore has been reduced to two: the schools of the University of Maryland and the Johns Hopkins University.

The professors and associate professors of Surgery in 1932 are these MDs:

J.C. Bloodgood, Johns Hopkins University; J.S. Davis, Johns Hopkins University; C.R. Edwards, University of Maryland; J.M.T. Finney, Johns Hopkins University; W.M. Frior, Johns Hopkins University; R.H. Follis, Johns Hopkins University; E.H. Hutchins, University of Maryland; F.L. Jennings, University of Maryland; Dean D. Lewis, Johns Hopkins University; F. Lynn, University of Maryland; Alexius McGlannan, University of Maryland; A.M. Shipley, University of Maryland; H.B. Stone, Johns Hopkins University; and W.D. Wise, University of Maryland.

American College of Surgeons

The American College of Surgeons was organized in 1913 to elevate the standards of Surgery in America. The initial success of this organization was due in no small part to the confidence of the surgeons of the United States in the wisdom and integrity of the first President, Dr. J.M.T. Finney of Baltimore.

The Maryland Surgeons enrolled at the first convocation of the College were:

T.A. Ashby, W.S. Baer, B.B. Bernheim, J.C. Bloodgood, J.W. Chambers, C.A. Clapp, S.M. Cone, T.S. Cullen, J.S. Davis, S.G. Davis, Jr., S.T. Earle, J.M.T. Finney, W.A. Fisher, R.H. Follis, Harry Friedenwald, A.C. Harrison, J.M. Hundley, G.L. Hunner, H.A. Kelly, Frank Martin, Alexius McGlannan, W.E. Moseley, O.B. Pancoast, W.B. Platt, A.J.N. Reik, H.O. Reik, W.W. Russell, A.M. Shipley, George Walker, J.W. Williams, J.R. Winslow, Randolph Winslow, T.C. Worthington, and H.H. Young.

Schweiker-Kennedy Bill

Congress in its closing hours in October, 1978, gave its final approval to the Health Maintenance Organization Act Amendments of 1978 sponsored by US Senators Richard S. Schweiker (R-PA) and Edward M. Kennedy (D-MA.)

"The success of this important health legislation is the result of bipartisan cooperation involving the Carter Administration and many members of the Senate. This effort reflects the view that Health Maintenance Organizations can become a major asset in holding down health costs and meeting national health care goals," Schweiker said.

HMOs are pre-paid health plans in which members make fixed regular payments entitling them to a variety of health care services. The emphasis in HMOs is on preventive care, rather than the treat-

ment of chronic or crisis illness. Because of prepayments, there is an economic incentive to maintain HMO members' health to avoid costly or unnecessary treatment.

Schweiker pointed out that HMOs are a promising way for driving down health care costs and, at the same time, improving access and quality of care through the operation of internal incentives, rather than direct government regulation.

The major provisions of the bill are:

Strengthens provisions designed to prevent fraud and abuse in the HMO program.

Extends for three years the authorizations of appropriations for HMO feasibility, planning and initial development grants and contracts for a three-year total of \$164 million.

Adds new authority for loans and loan guarantees to assist in the costs of equipping, constructing, acquiring or renovating ambulatory care facilities. This could mean up to \$2.5 million per HMO facility.

Extends for three years the au-

thority for initial operating loans and loan guarantees. The maximum was raised from \$2.5 to \$4.5 million per HMO.

Authority to train HMO managers and provide HEW technical assistance.

Sen. Schweiker is ranking Republican on the Senate Health Subcommittee, while Sen. Kennedy is the Chairman. □

Donovan-Corman Debate

National Health Insurance for the United States was the subject of a debate before the Pennsylvania Political Union of the University of Pennsylvania between Representative James C. Corman (D-CA) and **Raymond J. Donovan, Jr., MD**, a Baltimore surgeon and member of the *Journal's* Editorial Board.

Dr. Donovan, whose practice is centered at St. Agnes Hospital, is Chairman of the Med-Chi Public Relations Committee and a member of the Speakers' Bureau of the American Medical Association.

Rep. Corman, together with Senator Edward M. Kennedy (D-MA) cosponsored the Health Security Act of 1977. □

SEN. KENNEDY in July, 1978.

Should you expect Nurse Peabody to do the work of the Diablo 3200?

The Diablo 3200 Video Medical/Management System bills third parties, accounts for patient receivables, pays your vendors and employees, and prints your financial reports, *now*. Additional patient information storage, retrieval and reporting capabilities are available through the 3200's English language like programming facilities.

The big video display makes charge posting, patient/guarantor alphabetic look-up and complex revenue analyses easy and accurate. Thousands of patient records are stored on inexpensive diskettes; tens of thousands on disks. Extraordinary printers produce patient bills, superbills and financial reports quickly and accurately.

Additional video displays, expanded information storage, and communications facilities permit the 3200 to grow with your expanding requirements.

What's the bottom line? You can lease the Diablo 3200 for as little as \$500.00 a month, and you don't need additional people to operate it.

Let the Diablo 3200 take care of your paperwork, while you and Nurse Peabody take care of your patients.

Dyazide[®]

Each capsule contains 50 mg. of Dyrenium[®] (brand of triamterene) and 25 mg. of hydrochlorothiazide.

Makes Sense in Hypertension*

Before prescribing, see complete prescribing information in SK&F Co. literature or PDR. A brief summary follows:

* **Warning**

This drug is not indicated for initial therapy of edema or hypertension. Edema or hypertension requires therapy titrated to the individual. If this combination represents the dosage so determined, its use may be more convenient in patient management. Treatment of hypertension and edema is not static, but must be reevaluated as conditions in each patient warrant.

Contraindications: Further use in anuria, progressive renal or hepatic dysfunction, hyperkalemia. Pre-existing elevated serum potassium. Hypersensitivity to either component or other sulfonamide-derived drugs.

Warnings: Do not use potassium supplements, dietary or otherwise, unless hypokalemia develops or dietary intake of potassium is markedly impaired. If supplementary potassium is needed, potassium tablets should not be used. Hyperkalemia can occur, and has been associated with cardiac irregularities. It is more likely in the severely ill, with urine volume less than one liter/day, the elderly and diabetics with suspected or confirmed renal insufficiency. Periodically, serum K⁺ levels should be determined. If hyperkalemia develops, substitute a thiazide alone, restrict K⁺ intake. **Associated widened QRS complex or arrhythmia requires prompt additional therapy.** Thiazides cross the placental barrier and appear in cord blood. Use in pregnancy requires weighing anticipated benefits against possible hazards, including fetal or neonatal jaundice, thrombocytopenia, other adverse reactions seen in adults. Thiazides appear and triamterene may appear in breast milk. If their use is essential, the patient should stop nursing. Adequate information on use in children is not available.

Precautions: Do periodic serum electrolyte determinations (particularly important in patients vomiting excessively or receiving parenteral fluids). Periodic BUN and serum creatinine determinations should be made, especially in the elderly, diabetics or those with suspected or confirmed renal insufficiency. Watch for signs of impending coma in severe liver disease. If spiro-lactone is used concomitantly, determine serum K⁺ frequently; both can cause K⁺ retention and elevated serum K⁺. Two deaths have been reported with such concomitant therapy (in one, recommended dosage was exceeded, in the other serum electrolytes were not properly monitored). Observe regularly for possible blood dyscrasias, liver damage, other idiosyncratic reactions. Blood dyscrasias have been reported in patients receiving triamterene, and leukopenia, thrombocytopenia, agranulocytosis, and aplastic anemia have been reported with thiazides. Triamterene is a weak folic acid antagonist. Do periodic blood studies in cirrhotics with splenomegaly. Antihypertensive effect may be enhanced in post-sympathectomy patients. Use cautiously in surgical patients. The following may occur: transient elevated BUN or creatinine or both, hyperglycemia and glycosuria (diabetic insulin requirements may be altered), hyperuricemia and gout, digitalis intoxication (in hypokalemia), decreasing alkali reserve with possible metabolic acidosis. 'Dyazide' interferes with fluorescent measurement of quinidine.

Adverse Reactions: Muscle cramps, weakness, dizziness, headache, dry mouth; anaphylaxis, rash, urticaria, photosensitivity, purpura, other dermatological conditions; nausea and vomiting, diarrhea, constipation, other gastrointestinal disturbances. Necrotizing vasculitis, paresthesias, icterus, pancreatitis, xanthopsia and, rarely, allergic pneumonitis have occurred with thiazides alone.

Supplied: Bottles of 100 and 1000 capsules; Single Unit Packages of 100 (intended for institutional use only).

symptom...**

... in functional G.I. disorders*

Bentyl[®]

(dicyclomine hydrochloride USP)

10 mg. capsules, 20 mg. tablets,
10 mg./5 ml. syrup, 10 mg./ml. injection

helps control abnormal motor activity
with minimal anticholinergic side effects†

Demonstrated smooth muscle relaxant activity.

In this double-blind study, twenty patients having G.I. series and exhibiting spasm were randomly selected to receive either 2 cc. of Bentyl or sodium chloride intramuscularly. Ten minutes after the injection another radiograph was taken . . .

. . . Bentyl produced definite relaxation in 8 of 10 patients. The sodium chloride produced relaxation in only 3 of 10. No side effects occurred in either group of patients.

Pylorospasm has almost totally blocked passage of barium meal.

Barium meal beginning to pass 10 minutes after intramuscular injection of 20 mg. Bentyl.

"The correlation of spasm relief and drug given was excellent."

*This drug has been classified "probably" effective in treating certain functional G.I. disorders.

†See Warnings, Precautions and Adverse Reactions.

See following page for prescribing information.

Merrell

Bentyl®

(dicyclomine hydrochloride USP)

Capsules, Tablets, Syrup, Injection
AVAILABLE ONLY ON PRESCRIPTION.

Brief Summary
INDICATIONS

For use as adjunctive therapy in the treatment of peptic ulcer. IT SHOULD BE NOTED AT THIS POINT IN TIME THAT THERE IS A LACK OF CONCURRENCE AS TO THE VALUE OF ANTICHLINERGICS/ANTISPASMODICS IN THE TREATMENT OF GASTRIC ULCER. IT HAS NOT BEEN SHOWN CONCLUSIVELY WHETHER ANTICHLINERGIC/ANTISPASMODIC DRUGS AID IN THE HEALING OF A PEPTIC ULCER, DECREASE THE RATE OF RECURRENCES, OR PREVENT COMPLICATION.

Based on a review of this drug by the National Academy of Sciences—National Research Council and/or other information, FDA has classified the following indications as "probably" effective:

May also be useful in the irritable bowel syndrome (irritable colon, spastic colon, mucous colitis, acute enterocolitis, and functional gastrointestinal disorders); and in neurogenic bowel disturbances (including the splenic flexure syndrome and neurogenic colon).

THESE FUNCTIONAL DISORDERS ARE OFTEN RELIEVED BY VARYING COMBINATIONS OF SEDATIVE, REASSURANCE, PHYSICIAN INTEREST, AMELIORATION OF ENVIRONMENTAL FACTORS.

For use in the treatment of infant colic (syrup).

Final classification of the less-than-effective indications requires further investigation.

CONTRAINDICATIONS: Obstructive uropathy (for example, bladder neck obstruction due to prostatic hypertrophy); obstructive disease of the gastrointestinal tract (as in achalasia, pyloro-duodenal stenosis); paralytic ileus, intestinal atony of the elderly or debilitated patient; unstable cardiovascular status in acute hemorrhage; severe ulcerative colitis; toxic megacolon complicating ulcerative colitis; myasthenia gravis. **WARNINGS:** In the presence of a high environmental temperature, heat prostration can occur with drug use (fever and heat stroke due to decreased sweating). Diarrhea may be an early symptom of incomplete intestinal obstruction, especially in patients with ileostomy or colostomy. In this instance treatment with this drug would be inappropriate and possibly harmful. Bentyl may produce drowsiness or blurred vision. In this event, the patient should be warned not to engage in activities requiring mental alertness such as operating a motor vehicle or other machinery or perform hazardous work while taking this drug. **PRECAUTIONS:** Although studies have failed to demonstrate adverse effects of dicyclomine hydrochloride in glaucoma or in patients with prostatic hypertrophy, it should be prescribed with caution in patients known to have or suspected of having glaucoma or prostatic hypertrophy. Use with caution in patients with: autonomic neuropathy; hepatic or renal disease; ulcerative colitis—Large doses may suppress intestinal motility to the point of producing a paralytic ileus and the use of this drug may precipitate or aggravate the serious complication of toxic megacolon; hyperthyroidism, coronary heart disease, congestive heart failure, cardiac arrhythmias, and hypertension; hiatal hernia associated with reflux esophagitis since anticholinergic drugs may aggravate this condition. It should be noted that the use of anticholinergic/antispasmodic drugs in the treatment of gastric ulcer may produce a delay in gastric emptying time and may complicate such therapy (antral stasis). Do not rely on the use of the drug in the presence of complication of biliary tract disease. Investigate any tachycardia before giving anticholinergic (atropine-like) drugs since they may increase the heart rate. With overdose, a curare-like action may occur. **ADVERSE REACTIONS:** Anticholinergics/antispasmodics produce certain effects which may be physiologic or toxic depending upon the individual patient's response. The physician must delineate these. Adverse reactions may include xerostomia; urinary hesitancy and retention; blurred vision and tachycardia; palpitations; mydriasis; cycloplegia; increased ocular tension; loss of taste; headache; nervousness; drowsiness; weakness; dizziness; insomnia; nausea; vomiting; impotence; suppression of lactation; constipation; bloated feeling; severe allergic reaction or drug idiosyncrasies including anaphylaxis; urticaria and other dermal manifestations; some degree of mental confusion and/or excitement, especially in elderly persons; and decreased sweating. With the injectable form there may be a temporary sensation of lightheadedness and occasionally local irritation. **DOSAGE AND ADMINISTRATION:** Dosage must be adjusted to individual patient's needs.

Usual Dosage. Bentyl 10 mg. capsule and syrup: Adults: 1 or 2 capsules or teaspoonfuls syrup three or four times daily. Children: 1 capsule or teaspoonful syrup three or four times daily. Infants: ½ teaspoonful syrup three or four times daily. (May be diluted with equal volume of water.) **Bentyl 20 mg.:** Adults: 1 tablet three or four times daily. **Bentyl Injection:** Adults: 2 ml. (20 mg.) every four to six hours intramuscularly only. **NOT FOR INTRAVENOUS USE. MANAGEMENT OF OVERDOSE:** The signs and symptoms of overdose are headache, nausea, vomiting, blurred vision, dilated pupils, hot, dry skin, dizziness, dryness of the mouth, difficulty in swallowing, CNS stimulation. Treatment should consist of gastric lavage, emetics, and activated charcoal. Barbiturates may be used either orally or intramuscularly for sedation but they should not be used if Bentyl with Phenobarbital has been ingested. If indicated, parenteral cholinergic agents such as Urecholine® (bethanechol chloride USP) should be used.

Clinical Center Study of Patients Requiring Orthognathic Surgery

The cooperation of physicians and dentists is requested in the referral of patients in need of orthognathic surgery for a study being conducted by the National Institute of Dental Research, the National Institutes of Health, Bethesda, MD.

To be eligible for the study, patients must be between the ages of 15 and 45 years and in good physical and mental health. They must have a dentofacial deformity and/or severe malocclusion with an essential cosmetic component that requires surgical correction as well as orthodontic therapy. Patients with Class II or III malocclusions, apertognathia and severe facial asymmetry are included. Patients selected for this study must be available for treatment and follow-up at the clinical Center for approximately three years.

All patients who are referred will undergo a screening examination, orthodontic work-up and psychological evaluation by NIDR staff members to determine final acceptability.

To refer a patient or obtain further information, please call or write James B. Sweet, DDS, MS, Bdg. 10, Rm. 1B-20, National Institutes of Health, Bethesda, MD 20014; phone (301) 496-4371.

Patients Needed

The National Cancer Institute-VA Medical Oncology Branch, located at the Veterans Administration Hospital, Wash., DC, requests your cooperation in referral of veteran or non-veteran patients with the following malignancies:

1. *Small Cell Carcinoma (Oat Cell or other small cell varieties) of the Lung* for treatment with intensive chemotherapy. Patients should not have received prior chemotherapy or radiotherapy.

2. *Epidermoid (Squamous) Carcinoma and Adenocarcinoma of the Lung* for treatment with chemotherapy. The patient should have unresectable disease, be fully ambulatory, have no prior treatment with radio- or chemotherapy and have evaluable lesions.

3. *Hepatocellular Carcinoma (Hepatoma)* for treatment with chemotherapy and hormonal therapy or consideration of combined chemotherapy and surgery for local disease.

4. *Advanced Prostatic Carcinoma (Stage D)* for treatment with chemotherapy and hormonal therapy. Patients who have failed estrogen therapy are eligible.

5. *Multiple Myeloma—Waldenstrom's Macroglobulinemia, Heavy Chain Disease and related monoclonal gammopathies* for combination chemotherapy treatment. Patients who have received no prior chemotherapy are eligible.

6. *Cutaneous T-Cell Lymphomas—including Mycosis Fungoides and Sézary Syndrome* for treatment with electron beam radiotherapy and/or chemotherapy. Patients

with all stages of disease are eligible.

7. *Non-resetable or recurrent Gastric Carcinoma*—for treatment with combination chemotherapy. The patient should have unresectable disease, be fully ambulatory, have no prior chemotherapy and have evaluable lesions. Patients who have received radiation therapy are eligible.

The referring physicians will be kept fully informed as to the results of treatment and are encouraged to participate in the follow-up care of their patients. In addition, the Branch is serving as a lung cancer pathology reference center.

To refer a patient or to obtain further information, please call or write Dr. Martin H. Cohen, Dr. Daniel C. Ihde, Dr. Paul Bunn or Dr. John Minna: NCI-VA Medical Oncology, 2CN, Veterans Administration Hosp., 50 Irving St., NW, Wash., DC 20422; phone (202) 389-7275 or 7558.

American Doctors Lead Victory Over Yellow Fever

Within the lifetime of some Americans still living today, yellow fever was a feared and dreaded disease that swept American cities from time to time, striking tens of thousands and taking many lives.

Yellow fever likely was brought to the Americas in the 16th Century from the Old World. In America, it became a feared scourge, and New World doctors were the first to study the disease.

Dr. John Crawford of Baltimore is credited by medical historians as first determining that mosquitoes were the source of malaria, yellow fever and other diseases. Dr. Crawford clashed vigorously with the famed Dr. Benjamin Rush, a signer of the Declaration of Independence, who believed that yellow fever was caused

by something foul in the air.

Dr. Carlos Juan Finlay of Cuba, in experiments in the 1880s, tested the theory that the *Aedes Aegypti* mosquito was the transmitter of yellow fever. Taking off from Dr. Finlay's inconclusive work, a US Army Medical team led by Dr. Walter Reed in 1901 showed once and for all that the mosquito was the culprit in a medical experiment that was the theme of a famous Broadway play of a generation ago, *Yellow Jack*.

It fell to William Crawford Gorgas of the Army Medical Corps to demonstrate that he could stop yellow fever in Havana by eradication of the mosquito from the swamps and waterways of the Cuban capital. Gen. Gorgas repeated his success in Panama, making possible the digging of the Panama Canal by laborers freed from the hazard of the serious disease.

Gen. Gorgas later headed the Rockefeller Foundation Yellow Fever Commission that wiped out the disease in many Latin American countries and worked on the problem in Africa, and in the late 1930s a researcher at the Rockefeller Foundation laboratories perfected a vaccine against Yellow Fever.

The last epidemic in the US was in New Orleans in 1905, causing more than 400 deaths and almost 3,500 cases. New Orleans had neglected to carry out a mosquito-eradication campaign, but after the epidemic, moved to eliminate the breeding areas.

Ironically, at an international medical meeting some years ago, the Republic of Panama pointed out that the *Aedes Aegypti* mosquito still flourished in some Southern states of the US, and that all that was needed for another outbreak was for an infected individual to come into a Southern airport from abroad and be bitten by a mosquito. An eradication campaign was ordered. □

Your Medical Faculty At Work

JOHN SARGEANT, CAE, Executive Director

Executive Committee

The Executive Committee met on Nov. 2, 1978 and took the following actions:

1. Approved loan of the bronze Frank Frick plaque now in the Faculty Library to the Walters Gallery for an exhibition during the period of January through March, 1979.

2. Authorized development and implementation of a program for Physician pre-retirement and retirement by the Committee on Physician Rehabilitation.

3. Authorized a personnel study which would establish minimums and maximums for employees by position, as well as development of job descriptions and other details involving personnel policy.

4. Heard a report on the Inter-Agency Council activity and authorized, in principle, the participation by the Faculty of peer review of in-hospital medical care, subject to development of appropriate guidelines in this connection.

5. Approved participation in a 13-week talk show in WBJC-FM every other Wednesday and authorized expenditure of funds to cover production costs of the show.

6. Approved participation by submitting a nominee to serve on a new State Education Department Committee on Nutrition Education and Training Program. □

Council

The Council met on Nov. 30, 1978 and took the following actions:

1. Designated the firm of Anderson, Coe and King as legal counsel for 1979 under the same terms and conditions as in 1978.

2. Established Council meeting dates for 1979.

3. Approved waiver of dues for individual members on the recommendation of their component society.

4. Approved, at the request of the appropriate component society, a recommendation to the House of Delegates for Emeritus Membership for four physicians.

5. Approved a proposed fundraising project of the Library to provide additional medical journal subscriptions.

6. Received a report dealing with a proposed Consortium of Hospital Medical Libraries.

7. Adopted the following policy position in connection with Home Deliveries:

"Labor and delivery, while a physiologic process, clearly presents potential hazards to both mother and

fetus before and after birth. These hazards require standards of safety which are provided in the hospital setting and cannot be matched in the home situation.

"We recognize, however, the legitimacy of the concern of many that the events surrounding birth be an emotionally satisfying experience for the family. The Medical and Chirurgical Faculty of the State of Maryland supports these actions that improve the experience of the family while continuing to provide the mother and her infant with accepted standards of safety available only in the hospital."

8. Approved a recommendation of the Committee on Preventive Medicine and Public Health that would ban smoking in public places, and referred this to the Legislative Committee for drafting of appropriate legislation and its introduction into the 1979 General Assembly session.

9. Approved a recommendation of the Physician Rehabilitation Committee that Baltimore be offered to the AMA as a site for the Fourth Annual Conference on the Impaired Physician.

10. Designated Alva S. Baker, MD, Westminster, to serve on the Program and Arrangements Committee through the 1979 Annual Meeting.

11. Rereferred to the Jail Project Advisory Committee its proposed **Guidelines for Jail Facilities and Equipment** with some specific suggestions for changes and a request that such guidelines be redrafted and submitted for approval.

12. Approved submission of the name of R. Adam Cowlep, MD of Baltimore as a nominee for the AMA Sheen Award.

13. Declined to adopt a recommendation of the Policy and Planning Committee dealing with Maryland Blue Shield and authorized the President to name an Ad Hoc Committee to meet with Blue Shield representatives and attempt to resolve what appears to be some deficiencies in the relationship of Blue Shield with individual physicians.

14. Adopted the following resolution:

WHEREAS, It has long been the objective of the medical profession that patients receive the highest quality of medical care and services and

WHEREAS, The Medical and Chirurgical Faculty of the State of Maryland's policy is that the interests of the patient are paramount in receiving medical care and services and

WHEREAS, The Faculty has also adopted the position that a physician has the right to select whom he serves, except in the case of emergency, when he should make his services available if they are needed, and

WHEREAS, The proposed settlement in the Pennsylvania chiropractic suit against various specialty and state medical societies, as well as the American Medical Association, provides for these principles, be it therefore

Resolved, That the Medical and Chirurgical Faculty supports the action of the AMA Board of Trustees in its decision to terminate the AMA's involvement in the litigation currently taking place in Pennsylvania and be it further

Resolved, That the Faculty's Delegates to the AMA House of Delegates introduce the above resolution at the Interim Session of the AMA House of Delegates.

15. Adopted a position paper on Second Opinions. (This is published in full at the end of this report.)

16. Approved Faculty sponsorship of TelMed with no financial commitment involved, such sponsorship being for planning purposes only.

17. Authorized the President to name an Ad Hoc group to review present HMO activities and to ascertain if policies are being followed that are detrimental to patient care and the public. The group will make a report to the Council.

Recommendation from the Physician/Patient Relations Committee adopted by the Council, Nov. 30, 1978

Second Opinion Position

Upon direction from the Council, the Committee revised the Second Opinion document to apply to the entire practice of medicine rather than specifically to surgery. In addition, the Committee reduced the policy statement in size by deleting several areas which addressed the issue of unnecessary surgery. The revised statement is as follows:

The Faculty recognizes third-party carriers for making second opinions available to subscribers; however, second opinions should be sought at the request of the patient or physicians rather than be mandatory. A mandatory program may increase the potential for legal liability on the part of physicians. Where a bad result occurs and there is a difference of opinion between two competent physicians, one of the two may find himself faced with a lawsuit because retrospectively one may have been right and the other wrong. We have learned that litigation tends to aggravate the cost of medical care. Prudence, not compulsion, in seeking consultation is in the patient's best interest. (See *Infra*: Principles of Medical Ethics.)

The Faculty further recommends that the consultants considered for second opinions not be deemed qualified solely on the basis of Board Certification or other specialty society memberships. Expertise should be deemed to be present, *de facto*, where there is training and experience at least equal to that of the physician whose treatment is the subject of the consultation.

There are basic principles that must be recognized in any program offering the patient a choice of a second opinion.

1. The patient should select the consultant and likewise should select the physician who will render the treatment if indicated. In no case shall the consultant physician treat the patient without the knowledge of the original physician.

2. The establishment of a fixed fee for the second opinion or consultation and the requirement that the physician accept this as payment in full cannot bind the physician unless he agrees with this concept. Physician consultants shall not be limited to only those who

agree to the fixed fee, nor shall the patient's choice of consultants be limited to any such physicians.

3. The method of payment for the service shall remain the prerogative of the consultant physician; that is, he shall be free to bill the patient directly, bill the insurer directly or obtain an assignment of payment from the patient.

4. The attending physician must be advised that a second opinion is being sought, and must be advised by the consultant physician of the substance of his opinion in writing.

Finally, the Faculty endorses the principles of medical ethics, as enumerated by the AMA:

"Section 8: A physician should seek consultation upon request, in doubtful or difficult cases or whenever it appears that the quality of medical services may be enhanced thereby." □

Maryland Hospital Association Speaking of Hospitals

RICHARD J. DAVIDSON, Editor

Future Shock

By RICHARD J. DAVIDSON

Mr. Davidson is President of the Maryland Hospital Association, 1301 York Rd., Lutherville, MD 21093.

If we view our world from afar, it continues to move at the same speed it always has, but a closer look reveals that everything in our world moves at an ever more dizzying pace. Things change, sometimes faster than we would like, frequently before we are prepared to accept or cope with the change.

Hospitals and health professionals today face problems that are rooted in social, political and economic change. Hospitals are called on to reach out and serve larger community health needs. Physicians are deprived of the necessary time to practice their specialty with care and compassion. The health manpower revolution has created new kinds of jobs that never existed before.

Of course, all of us are familiar with rising costs and the alleged problem of excess beds, and there is the growing spectre of government regulation that comes with increased government funding.

Before taking a closer look at these changes, it might be worth our time to look at what we have been before looking at what we are about to become.

The modern hospital bears little resemblance to the hospital of the past. Today's hospital is a place of recovery. Up until the middle of the 19th Century, hospitals were considered as nothing more than places to die, usually in pain and suffering and alone.

In 1889, our own Johns Hopkins was among the first hospitals to set a new standard of healing based on science. That touched off a continuing demand for better, more efficient treatment and care, and that brought on the era of the specialist. The specialist brought new problems — communication problems. Specialization was keen, precise and efficient, but often impersonal.

Hospitals built since the 1960s, reflecting the age of the specialist, stressed technology in the care of the patient, but as the demand for the newest technology grew, so did the effects of inflation. Something fundamental was happening and it threatened to spin the system out of control. New rules, new perceptions were called for.

As inflation and consumer unrest soared, there came a torrent of new Federal health care legislation beginning with the 1965 Medicare and Medicaid Acts. That same year, Congress enacted regional medical care programs. The Comprehensive Health Care Planning Act came in 1966. In 1972, came standards for Professional Standards Review Organizations and, in 1973, the Health Maintenance Organization Act.

Now we are involved in a great debate over National Health Insurance, but, careful observers say the legislation hasn't a chance until the health care system, through internal reform, finds a way to control costs.

The difficult question we all face is how to control costs while improving care. The problem is all the more difficult as we discover that chronic disease is as much a product of lifestyle and mental attitude as it is of external disease agents. Meeting that challenge is, as Lewis Mumford said, "Akin to recomposing the score while conducting the symphony."

Something new is needed to take control of this fast-changing system, and that is a greater sense of cooperation between physician, hospital chief executive and trustee. The physician-specialist, overwhelmed by the growing complexities of his/her profession, needs to appreciate the support available from the trustee and the chief executive; support that allows him/her to focus on the specialty practice.

Changed, too, is the role of the hospital chief executive, who must reach out — from his/her own hospital — from neighboring hospitals — to the entire health care system. Without proper care and maintenance, a vital part can break down; and, when that happens, the entire system can be threatened.

Finally, the role of the trustee has changed. He or she is more than a lawyer, business executive or sometime booster. This is the dawning of the era of the skilled hospital trustee, whose caring and guiding hand leads the hospital through the tangle of legal, economic and regulatory uncertainties generated as a result of consumer demands and scrutiny by local, state and Federal watchdogs.

The point is: the ballgame has changed and all of us must understand those changes if we are to guide the evolution of the hospital into higher standards of care and community well-being.

To do that will require that all of us work together to avoid the trauma of future shock. □

Medical Miscellany

Fund for Those Under 18

The Children's Hospital in Baltimore has a fund known as the Stanley Phelps Fund, available for treatment of persons under the age of 18.

The guideline for persons to qualify for this fund is that they must be medically indigent, or they

may need further financial assistance.

There is a simple eligibility form to be completed at the time of application, and presented to the Committee for approval.

If you know of any patients who would qualify for help from this fund, please refer them to the Children's Hospital, Social Service Department, 3825 Greenspring Ave., Balto., MD 21211 or Miss Margaret E. Garrett.

Raymond V. Rangle, Esquire is Chairman of the Phelps Committee. ☐

The evidence of experience

Since October 1974 when Motrin® (ibuprofen) was introduced in the United States, it has been used by more than 6,000,000 patients with rheumatoid arthritis* or osteoarthritis. Rarely has an ethical pharmaceutical product been prescribed for so many patients in so short a time. In addition, more than 450 studies presenting new data related to Motrin have been published.

The 6,000,000 patients already treated with Motrin is an objective measure of physicians' confidence in the ability of Motrin to relieve the pain and inflammation associated with rheumatoid arthritis and osteoarthritis.

So it is not surprising that in this short period Motrin has become the most frequently prescribed alternative to aspirin. Motrin relieves joint pain and inflammation as effectively as indomethacin or aspirin, but causes significantly fewer CNS and milder GI reactions.

However, gastrointestinal bleeding, sometimes severe, has been associated with Motrin, aspirin, indomethacin, and other nonsteroidal antiarthritic agents.

*The safety and effectiveness of Motrin have not been established in patients with Functional Class IV rheumatoid arthritis (incapacitated, largely or wholly bedridden, or confined to wheelchair; little or no self-care).

Motrin[®] 400mg^{TABLETS}

ibuprofen, Upjohn

The confidence that comes from experience—
one more reason to prescribe Motrin.

Upjohn

The Upjohn Company, Kalamazoo, Michigan 49001

The confidence that comes from experience—
one more reason to prescribe

Motrin 400 mg TABLETS

ibuprofen, Upjohn

Indications and Usage: Treatment of signs and symptoms of rheumatoid arthritis and osteoarthritis during acute flares and in long-term management. Safety and efficacy have not been established in Functional Class IV rheumatoid arthritis.

Contraindications: Individuals hypersensitive to it, or with the syndrome of nasal polyps, angioedema and bronchospastic reactivity to aspirin or other nonsteroidal anti-inflammatory agents (see WARNINGS).

Warnings: Anaphylactoid reactions have occurred in patients with aspirin hypersensitivity (see CONTRAINDICATIONS).

Peptic ulceration and gastrointestinal bleeding, sometimes severe, have been reported. Ulceration, perforation, and bleeding may end fatally. An association has not been established. Motrin should be given under close supervision to patients with a history of upper gastrointestinal tract disease, only after consulting ADVERSE REACTIONS.

In patients with active peptic ulcer and active rheumatoid arthritis, nonulcerogenic drugs, such as gold, should be tried. If Motrin must be given, the patient should be under close supervision for signs of ulcer perforation or gastrointestinal bleeding.

Precautions: Blurred and/or diminished vision, scotomata, and/or changes in color vision have been reported. If these develop, discontinue Motrin and the patient should have an ophthalmologic examination, including central visual fields.

Fluid retention and edema have been associated with Motrin; use with caution in patients with a history of cardiac decompensation.

Motrin can inhibit platelet aggregation and prolong bleeding time. Use with caution in persons with intrinsic coagulation defects and those on anticoagulant therapy.

Patients should report signs or symptoms of gastrointestinal ulceration or bleeding, blurred vision or other eye symptoms, skin rash, weight gain, or edema.

To avoid exacerbation of disease or adrenal insufficiency, patients on prolonged corticosteroid therapy should have therapy tapered slowly when Motrin is added.

Drug interactions. Aspirin used concomitantly may decrease Motrin blood levels.

Coumarin: Bleeding has been reported in patients taking Motrin and coumarin.

Pregnancy and nursing mothers: Motrin should not be taken during pregnancy or by nursing mothers.

Adverse Reactions

Incidence greater than 1%

Gastrointestinal: The most frequent type of adverse reaction occurring with Motrin (ibuprofen) is gastrointestinal (4% to 16%). This includes nausea*, epigastric pain*, heartburn*, diarrhea, abdominal distress, nausea and vomiting, indigestion, constipation, abdominal cramps or pain, fullness of the GI tract (bloating and flatulence). **Central Nervous System:** Dizziness*, headache, nervousness. **Dermatologic:** Rash* (including maculopapular type), pruritus. **Special Senses:** Tinnitus. **Metabolic:** Decreased appetite, edema, fluid retention. Fluid retention generally responds promptly to drug discontinuation (see PRECAUTIONS).

Incidence: Unmarked 1% to 3%, *3% to 9%.

Incidence less than 1 in 100

Gastrointestinal: Upper GI ulcer with bleeding and/or perforation, hemorrhage, melena. **Central Nervous System:** Depression, insomnia. **Dermatologic:** Vesiculobullous eruptions, urticaria, erythema multiforme. **Cardiovascular:** Congestive heart failure in patients with marginal cardiac function, elevated blood pressure. **Special Senses:** Amblyopia (see PRECAUTIONS). **Hematologic:** Leukopenia, decreased hemoglobin and hematocrit.

Causal relationship unknown

Gastrointestinal: Hepatitis, jaundice, abnormal liver function. **Central Nervous System:** Paresthesias, hallucinations, dream abnormalities. **Dermatologic:** Alopecia, Stevens-Johnson syndrome. **Special Senses:** Conjunctivitis, diplopia, optic neuritis. **Hematologic:** Hemolytic anemia, thrombocytopenia, granulocytopenia, bleeding episodes. **Allergic:** Fever, serum sickness, lupus erythematosus syndrome. **Endocrine:** Gynecomastia, hypoglycemia. **Cardiovascular:** Arrhythmias. **Renal:** Decreased creatinine clearance, polyuria, azotemia.

Overdosage: In cases of acute overdosage, the stomach should be emptied. The drug is acidic and excreted in the urine, so alkaline diuresis may be beneficial.

Dosage and Administration: Suggested dosage is 300 or 400 mg t.i.d. or q.i.d. Do not exceed 2400 mg per day.

Prevent
Blindness.

Every 12 minutes someone goes blind. Yet, half of all blindness is needless. Early eye care for children can correct amblyopia. Glaucoma can be arrested... sight lost to cataracts, restored. Blinding eye injuries can be dramatically reduced by safety precautions. These all add up to saving precious sight. For more information write:

National Society for the Prevention of Blindness, 79 Madison Avenue, New York, NY 10016.

PREVENT BLINDNESS®

Upjohn

The Upjohn Company
Kalamazoo, Michigan 49001

For recurrent attacks of urinary tract infection in women

Bactrim™ DS Double Strength Tablets

Each tablet contains 160 mg trimethoprim and 800 mg sulfamethoxazole.

Just one tablet b.i.d. for 10 to 14 days

- Action at urinary/vaginal/lower bowel sites helps eliminate reservoirs of infecting organisms
- Distinctive antibacterial action plus wide spectrum helps eradicate recurrent UTI
- Low incidence of bacterial resistance in community practice

- Convenient b.i.d. dosage provides day-and-night antibacterial control
- Contraindicated during pregnancy and the nursing period. During therapy, maintain adequate fluid intake; perform CBC's and urinalyses with microscopic examination.

Before prescribing, please consult complete product information, a summary of which follows:

Indications and Usage: For the treatment of urinary tract infections due to susceptible strains of the following organisms: *Escherichia coli*, *Klebsiella-Enterobacter*, *Proteus mirabilis*, *Proteus vulgaris*, *Proteus morganii*. It is recommended that initial episodes of uncomplicated urinary tract infections be treated with a single effective antibacterial agent rather than the combination. Note: The increasing frequency of resistant organisms limits the usefulness of all antibacterials, especially in these urinary tract infections.

Also for the treatment of documented *Pneumocystis carinii* pneumonitis. To date, this drug has been tested only in patients 9 months to 16 years of age who were immunosuppressed by cancer therapy.

The recommended quantitative disc susceptibility method (*Federal Register*, 37:20527-20529, 1972) may be used to estimate bacterial susceptibility to Bactrim. A laboratory report of "Susceptible to trimethoprim-sulfamethoxazole" indicates an infection likely to respond to Bactrim therapy. If infection is confined to the urine, "Intermediate susceptibility" also indicates a likely response. "Resistant" indicates that response is unlikely.

Contraindications: Hypersensitivity to trimethoprim or sulfonamides; pregnancy; nursing mothers; infants less than two months of age.

Warnings: Deaths from hypersensitivity reactions, agranulocytosis, aplastic anemia and other blood dyscrasias have been associated with sulfonamides. Experience with trimethoprim is much more limited but occasional interference with hematopoiesis has been reported as well as an increased incidence of thrombopenia with purpura in elderly patients on certain diuretics, primarily thiazides. Sore throat, fever, pallor, purpura or jaundice may be early signs of serious blood disorders. Frequent CBC's are recommended; therapy should be discontinued if a significantly reduced count of any formed blood element is noted.

Precautions: Use cautiously in patients with impaired renal or hepatic function, possible folate deficiency, severe allergy or bronchial asthma. In patients with glucose-6-phosphate dehydrogenase deficiency, hemolysis, frequently dose-related, may occur. During therapy, maintain adequate fluid intake and perform frequent urinalyses, with careful microscopic examination, and renal function tests, particularly where there is impaired renal function.

Adverse Reactions: All major reactions to sulfonamides and trimethoprim are included, even if not reported with Bactrim. **Blood dyscrasias:** Agranulocytosis, aplastic anemia, megaloblastic anemia, thrombopenia, leukopenia, hemolytic anemia, purpura, hypoprothrombinemia and methemoglobinemia. **Allergic reactions:** Erythema multiforme, Stevens-Johnson syndrome, generalized skin eruptions, epidermal necrolysis, urticaria, serum sickness, pruritus, exfoliative dermatitis, anaphylactoid reactions, periorbital edema, conjunctival and scleral injection, photosensitization, arthralgia and allergic myocarditis. **Gastrointestinal reactions:** Glossitis, stomatitis, nausea, emesis, abdominal pains, hepatitis, diarrhea and pancreatitis. **CNS reactions:** Headache,

peripheral neuritis, mental depression, convulsions, ataxia, hallucinations, tinnitus, vertigo, insomnia, apathy, fatigue, muscle weakness and nervousness. **Miscellaneous reactions:** Drug fever, chills, toxic nephrosis with oliguria and anuria, periarteritis nodosa and L. E. phenomenon. Due to certain chemical similarities to some goitrogens, diuretics (acetazolamide, thiazides) and oral hypoglycemic agents, sulfonamides have caused rare instances of goiter production, diuresis and hypoglycemia in patients; cross-sensitivity with these agents may exist. In rats, long-term therapy with sulfonamides has produced thyroid malignancies.

Dosage: Not recommended for infants less than two months of age.

Urinary Tract Infections: Usual adult dosage—1 DS tablet (double strength), 2 tablets (single strength) or 4 teasp. (20 ml) b.i.d. for 10-14 days.

Recommended dosage for children—8 mg/kg trimethoprim and 40 mg/kg sulfamethoxazole per 24 hours, in two divided doses for 10 days. A guide follows:

Children two months of age or older:

Weight		Dose—every 12 hours	
lbs	kgs	Teaspoonfuls	Tablets
20	9	1 teasp. (5 ml)	½ tablet
40	18	2 teasp. (10 ml)	1 tablet
60	27	3 teasp. (15 ml)	1½ tablets
80	36	4 teasp. (20 ml)	2 tablets or 1 DS tablet

For patients with renal impairment:

Creatinine Clearance (ml/min)	Recommended Dosage Regimen
Above 30	Usual standard regimen
15-30	½ the usual regimen
Below 15	Use not recommended

***Pneumocystis carinii* pneumonitis:** Recommended dosage: 20 mg/kg trimethoprim and 100 mg/kg sulfamethoxazole per 24 hours in equal doses every 6 hours for 14 days. See complete product information for suggested children's dosage table.

Supplied: Double Strength (DS) tablets, each containing 160 mg trimethoprim and 800 mg sulfamethoxazole, bottles of 100; Tel-E-Dose® packages of 100. Tablets, each containing 80 mg trimethoprim and 400 mg sulfamethoxazole—bottles of 100 and 500; Tel-E-Dose® packages of 100; Prescription Paks of 40, available singly and in trays of 10. Oral suspension, containing in each teaspoonful (5 ml) the equivalent of 40 mg trimethoprim and 200 mg sulfamethoxazole, fruit-licorice flavored—bottles of 16 oz (1 pint).

Her next attack of cystitis may require

the BactrimTM 3-system counterattack

ROCHE

Bactrim has shown high clinical effectiveness in recurrent cystitis as a result of its wide spectrum and distinctive antimicrobial action in the urinary, vaginal and lower intestinal tracts.

The probability of recurrent urinary tract infection appears to be enhanced by the establishment of large numbers of *E. coli* or other urinary pathogens on the vaginal introitus. The trimethoprim component of

Bactrim diffuses into vaginal fluid in effective concentrations, thus combating migration of pathogens into the urethra.

Studies have shown that Bactrim acts against *Enterobacteriaceae* in the bowel without the emergence of resistant organisms. Thus, Bactrim reduces the risk of introital colonization by fecal uropathogens. It has *no* significant effect on other normal, necessary intestinal flora.

Bactrim fights uropathogens in the urinary tract/vaginal tract/lower intestinal tract

Are Billing and Receivables Important to You?

CAS means: effective patient account management

CAS Provides a "Results" System Tailored to Your Needs

- is designed specifically for group practice management needs;
- is user-controlled and directed for assured accuracy and efficiency;
- can be effectively operated by non-technical administrative personnel;
- provides fast, accurate, reliable billing to all parties;
- provides automatic rebilling and collection follow-up;
- issues timely and effective practice activity reports;
- is kept up-to-date by professional group practice managers;
- improves cash flow;
- increases total collections;
- is fully confidential.

CAS' Staff are experienced Group Practice Managers! We are available for management consultation. We monitor the business practice issues especially those related to third party payors and government units. This monitoring makes it possible for CAS to implement carefully thought-out plans rather than reacting to unnecessary crises.

Our pricing structure is based on our performance and is very competitive; you only pay for the bills, statements and reports produced. We depend on our performance which assures you

peace-of-mind. The CAS System pays for itself!

Headquartered in Baltimore, CAS effectively serves this region by providing its computerized system as a tool for your management or by providing total patient account management services.

For the best results from patient account management, enter into a CAS partnership. Call or write for a free brochure.

I would like more information about how CAS can make my patient account management task easier:

- ☐ Have someone call to discuss my requirements.
☐ Send me more information.

PERFORMANCE. PROVEN EFFECTIVENESS WITHIN A WIDE SAFETY MARGIN.

While Roche Laboratories already knows more about the performance of Librium than anyone else, we keep on learning every day.

For example, the highly favorable benefits-to-risk ratio of Librium is a well-documented matter of record.

And, of course, the specific calming action of Librium has been demonstrated in millions of patients around the world. In a large number of these patients, Librium was used concomitantly with other primary medications.

Proven performance within a wide safety margin. Basically, that's what Librium is all about.

LIBRIUM® chlordiazepoxide HCl/Roche THE ANXIETY-SPECIFIC

Before prescribing, please consult complete product information, a summary of which follows:

Indications: Relief of anxiety and tension occurring alone or accompanying various disease states. Efficacy beyond four months not established by systematic clinical studies. Periodic reassessment of therapy recommended.

Contraindications: Patients with known hypersensitivity to the drug.

Warnings: Warn patients that mental and/or physical abilities required for tasks such as driving or operating machinery may be impaired, as may be mental alertness in children, and that concomitant use with alcohol or CNS depressants may have an additive effect. Though physical and psychological dependence have rarely been reported on recommended doses, use caution in administering to addiction-prone individuals or those who might increase dosage; withdrawal symptoms (including convulsions), following discontinuation of the drug and similar to those seen with barbiturates, have been reported.

Usage in Pregnancy: Use of minor tranquilizers during first trimester should almost always be avoided because of increased risk of congenital malforma-

tions as suggested in several studies. Consider possibility of pregnancy when instituting therapy; advise patients to discuss therapy if they intend to or do become pregnant.

Precautions: In the elderly and debilitated, and in children over six, limit to smallest effective dosage (initially 10 mg or less per day) to preclude ataxia or oversedation, increasing gradually as needed and tolerated. Not recommended in children under six. Though generally not recommended, if combination therapy with other psychotropics seems indicated, carefully consider individual pharmacologic effects, particularly in use of potentiating drugs such as MAO inhibitors and phenothiazines. Observe usual precautions in presence of impaired renal or hepatic function. Paradoxical reactions (e.g., excitement, stimulation and acute rage) have been reported in psychiatric patients and hyperactive aggressive children. Employ usual precautions in treatment of anxiety states with evidence of impending depression; suicidal tendencies may be present and protective measures necessary. Variable effects on blood coagulation have been reported very rarely in patients receiving the drug and oral anticoagulants; causal relationship has not been established clinically.

Adverse Reactions: Drowsiness, ataxia and confusion may occur, especially in the elderly and debilitated. These are reversible in most instances by proper dosage adjustment, but are also occasionally observed at the lower dosage ranges. In a few instances syncope has been reported. Also encountered are isolated instances of skin eruptions, edema, minor menstrual irregularities, nausea and constipation, extrapyramidal symptoms, increased and decreased libido—all infrequent and generally controlled with dosage reduction; changes in EEG patterns (low-voltage fast activity) may appear during and after treatment; blood dyscrasias (including agranulocytosis), jaundice and hepatic dysfunction have been reported occasionally, making periodic blood counts and liver function tests advisable during protracted therapy.

Supplied: Librium® Capsules containing 5 mg, 10 mg or 25 mg chlordiazepoxide HCl. Libritabs® Tablets containing 5 mg, 10 mg or 25 mg chlordiazepoxide.

AN EXTENSION OF HOPE FOR THE ALCOHOLIC

HIDDEN BROOK BEL AIR

Established 1968

We are pleased to announce the opening of Hidden Brook at Warwick. This is a major new enlargement of our capacity for the treatment of alcoholics...an expansion of 20 additional beds to the 39 already at Bel Air. Beautifully situated on the waterfront of the Warwick River near Secretary, Maryland in Dorchester County...the total environment is peaceful and ideally conducive to rehabilitation. The program, philosophy and rates of Hidden Brook at Warwick will be identical and interchangeable in every respect with the program at Hidden Brook, Bel Air. Request our brochure. Write or phone for information.

Now, in addition HIDDEN BROOK at WARWICK

7% of the population may be harboring latent or dormant tuberculosis*

**Are you testing for it during
routine office physicals?**

*Based on a national estimate of 15 million tuberculin reactors
Stead, W.W. and Bates, J., in Harrison's Principles of Medicine,
8th Edition, 1977, McGraw-Hill, p. 900.

✓ LEDERLE Tuberculin, Old

TINE TEST®

An important check in every checkup.

A system, not just a test — supplied with patented induration indicator cards in English or Spanish — simplifies recording and record keeping.

- Over 15 years of use — millions of tests performed each year.
- Practical and easy to perform — presterilized; disposable; no refrigeration needed; no needles or syringes.
- Fast — only seconds to perform — can be read in 48-72 hours.

Precautions: Tuberculin testing should be done with caution in persons with active tuberculosis. However, activation of quiescent lesions is rare.

Although clinical allergy to acacia is very rare, this product contains some acacia as a stabilizer and should be used with caution in patients with known allergy to this component. Reactivity to the test may be suppressed in patients who are receiving corticosteroids or immunosuppressive agents, or those who have recently been vaccinated with live virus vaccine such as measles.

With a positive reaction, further diagnostic procedures must be considered. These may include x-ray of the chest, microbiologic examinations of sputa and other

specimens, and confirmation of the positive TINE TEST using the Mantoux method. In general, the TINE TEST does not need to be repeated. Antituberculous chemotherapy should not be instituted solely on the basis of a single positive TINE TEST.

Adverse Reactions: Vesiculation, ulceration, or necrosis may occur at the test site in highly sensitive persons. Pain, pruritus and discomfort at the test site may be relieved by cold packs or by a topical glucocorticoid ointment or cream. Transient bleeding may be observed at a puncture site and is of no significance.

"Informative and Entertaining"

To the Editor:

Your **Journal** is to be commended for always being informative and entertaining. Of special interest to me are the articles on **Health in History** by Blaine Taylor. The most recent one, entitled **Some Medical-Historic Aspects of the Later Napoleonic Wars, 1812-15** (December, 1978); was fascinating.

The anecdote about the Earl of Uxbridge and the loss of his leg gave an insight into the indifference to danger and stoicism displayed by the British Officer Corps during those days. The story brings to mind a similar one about Lord Raglan, who was the Commander-in-Chief of the British Army in the Crimean

THE EMPEROR NAPOLEON I
and signature.

War of 1854. As a young officer at the Battle of Waterloo, his right arm was amputated, without anesthetic of course, on the field of battle. After the amputation, he called out, "Here, don't take that arm away until I have taken the ring off the finger!"

(Reference: Cecil Woodham-Smith: **The Reason Why**; McGraw Hill, 1954, p. 163.)

Med-Chi Applauded

To the Editor:

On behalf of the American Lung Association of Maryland, I would like to applaud the decision of the Medical and Chirurgical Faculty of Maryland to endorse a policy of "no smoking" at all business and professional meetings of the Faculty.

In a motion recently recommended by the Faculty's Committee on Preventive Medicine and Public Health, it is pointed out that because smoking is "Irritating, noxious and hazardous to both smokers and non-smokers," physicians should set an example by their habits and behavior which serves as a model for the maintenance of health habits in the community.

Second-hand smoke has higher concentrations of noxious compounds (tar, nicotine, carbon monoxide, ammonia and three-four benzpyrene—which is suspected as a cancer-causing agent) than the smoke which the smoker pulls through the cigar or cigarette when he/she inhales. This concentration not only can cause eye irritations, headaches and allergic reactions, but can aggravate the condition of a person with chronic bronchitis and emphysema as well.

Med-Chi's action is admirable.

SUSAN MATHER, MD

PHYSICIAN PLACEMENT SERVICE

The Medical and Chirurgical Faculty of the State of Maryland maintains a Placement Service for the convenience of Maryland physicians, hospitals and communities in search of candidates for positions available in our state. A detailed description of such opportunities should be forwarded to the Physician Placement Service, 1211 Cathedral St., Baltimore, MD 21201; telephone 1-301-539-0872.

Physicians wishing to locate in Maryland are invited to submit a resume to be kept on file with the Physician Placement Service. Candidates are requested to inform the Faculty when they are no longer available for consideration for opportunities which might be available in Maryland.

Journal announcements on the Classified Advertising page for Physician Placement Service are charged at the regular Classified Advertising rate.

Accept no substitute for your professional judgment

As a physician, you have the right to prescribe the drug which you believe will most benefit your patients. Now, substitution laws make it more difficult to exercise that right. In many states, unless you specifically direct pharmacists to dispense your brand-name prescription as written, they may be required by law to substitute another drug for your brand-name prescription.

This means that the ultimate drug selection is no longer yours; its source is left to the pharmacist's discretion. You will have forfeited your right to prescribe as you see fit. Preserve your rights. Specify that you will accept no substitution.

When you accept no substitutes...

- You ensure that your patient receives exactly that product you have specified on your prescription
- You choose the quality of the product dispensed to your patient
- You can exercise the right to select a product based upon its proven therapeutic performance and to select a manufacturer that stands behind its brand name or generic product
- You can support the kinds of research programs that are vital to new drug discovery and development
- You can help sustain important physician, pharmacist and patient education services supported by innovative, research-oriented firms

For complete information on the drug substitution law effective in your state, please consult your local Pfizer Representative.

Doctors in the News

Dr. Marvin Mones Named "Pediatrician of the Year!"

Marvin Mones, MD, an original organizer of Holy Cross Hospital prior to its opening in Silver Spring in 1963 and one of its Past Presidents, was named Pediatrician of the Year by the Montgomery-Prince George's County Pediatric Society recently. He received the award from outgoing Society President Larrie W. Greenberg, MD.

A Fellow of the American Academy of Pediatrics, Dr. Mones was cited for his "Unselfish contributions and devotion to pediatrics, locally, within the state and nationally."

In addition to his private practice which he established in 1950, Dr. Mones is currently active in the Academy—as a member of its Legislative Issues Committee, as an Alternate Chairman of its District III (MD, DE, WV, NJ, PA)

DR. MARVIN MONES

and as a member of its task force on national health planning.

He is also a member of the State Health Coordinating Council—Maryland's chief health planning agency—concerned with the availability of economically feasible health care for all.

On the occasion of this award, Dr. Mones acknowledged gratitude to his peers, the satisfaction of 28 years of service to his patients and the need for all pediatricians to actively participate in the shaping of the future of health care.

Dr. Antlitz Takes Charge

Albert M. Antlitz, MD was installed as President of the 1,680-member Baltimore City Medical Society at the Society's Annual Meeting in December, 1978. Dr. Antlitz is a graduate of Georgetown University Medical School and received his postgraduate training in medicine and cardiology at Mercy Hospital and the University of Maryland. He was appointed to his present position of Head of the Division of Cardiology of Mercy Hospital in 1962.

Dr. Antlitz has been active in both the City and State medical societies, serving on the Medical and Chirurgical Faculty Council and Executive Committee and on the City Society's Board of Directors. He is also a member of the Governing Body and Executive Committee of the Central Maryland Health Systems Agency and is Chairman of the Systems' Development Committee.

Other officers elected by the Society were Henry N. Wagner, MD, President-elect; Leon E. Kassel, MD, Vice President; Karl H. Weaver, MD, Secretary and Kennard Yaffe, MD, Treasurer. Elected to the Board of Directors were: Drs. Raymond M. Atkins, Frank L. Iber, Misbah Khan and Samuel M.M. Lumpkin. □

SYNDROME,**
by Sol B. Love, DDS

NOW effective June 1 **MONEY MARKET CERTIFICATES**

yield $1\frac{1}{4}\%$ more than the average
rate on 6 month U.S. Treasury Bills

Money Market Certificates from Arlington Federal are similar to a 6-month Treasury Bill except they pay $1\frac{1}{4}\%$ more than the average discount rate in the most recent weekly auction on 6-month Treasury Bills. For example, if the last Treasury Bill auction in May results in an average yield of 7.16%, our Money Market Certificate available on June 1 would have a rate of 7.41% per annum. These Certificates will be issued in minimum denominations of \$10,000, with a 6-month (26-week) maturity. There is a substantial penalty for early withdrawal.

also **8% SAVING
CERTIFICATES**
(effective annual yield 8.33%)

You can invest in these Saving Certificates in minimum denominations of \$1,000 and receive an 8% dividend compounded annually to 8.33%. The Certificates mature in 8 years. For investors who wish a long-term, high-yield Certificate insured up to \$40,000 by the Federal Savings and Loan Corporation, this is an unusual opportunity. There is a substantial penalty for early withdrawal. Stop in at any one of our convenient offices and ask about these new Certificates that are being offered for the first time on June 1.

M. McKendree Boyer, MD, 1907-78

Maryland lost one of its most outstanding Family Physicians in 1978 when M. McKendree Boyer, MD, of Damascus, MD died from complications arising from surgery. Dr. Boyer, or "Mac" as he was affectionately known to all his friends and patients, came from a family of physicians. It is hoped this line will continue with his son, George, who is currently a freshman at the University of Maryland School of Medicine.

Dr. Boyer served as President of the Medical and Chirurgical Faculty of the State of Maryland in 1963-64 and as an Alternate Delegate to the American Medical Association House of Delegates from Maryland since 1965.

Born in 1907, he was a graduate of the George Washington University School of Medicine in 1931, trained at St. Luke's Hospital in Cleveland from 1931-35 and carried out postgraduate work in London, England and Vienna, Austria. He commenced General Practice in Damascus in 1935, joining his father, with whom he practiced for many years.

Almost immediately on joining the Montgomery County Medical Society, of which he served as President in 1943, he became active in medical society affairs. He served in numerous capacities at the local level, and when he had exhausted the positions he could hold there, became active on a state level. He was elected Faculty President by unanimous vote of the House of Delegates at the Annual Meeting in 1962.

Dr. Boyer's empathy was well-expressed when he established the George M. Boyer, MD Lectureship Fund for his fellowman in memory of his father. He stated at that time:

"Dr. Boyer (George) had no special claim to fame, but was much beloved by and respected by not only his patients, but by the people of his community and county as well."

These apt words apply equally to "Mac" Boyer as they did to his father, and no person could have expressed them more cogently.

In a 1964 issue of the *Journal*, Dr. Boyer spoke to *The Changing Image of the American Physician*. In this article, he referred to his father again by saying:

"He was a self-effacing, gracious gentleman with the highest moral integrity. He combined his knowledge of medicine and his keen understanding of people with a warm and sympathetic personality to stimulate the confidence of his patients. He had utter disregard for personal comfort or for financial remuneration. The gratitude of an appreciative patient was adequate compensation."

Once again it is as though he were talking about himself, for all these attributes belong to the son as well. Truly, the Biblical words, "In his own Image" apply here.

Dr. Boyer did not confine his activities to the medical field or profession. He served as a member of the Board of Stewards of the Damascus Methodist Church, as a Vice President of the Bank of Damascus and as a member of the Damascus Lions Club and with numerous other civic organizations, also.

"Mac" will be sadly missed by all but, most importantly, his memory will live forever.

He is survived by his wife, the former Helen Warfield Souder and three children: Sally Ann, George and McKendree.

Nobody Does It Better

If you're a large volume hospital-based physician or have a private group with heavy monthly visits, you may have looked into outside solutions for your billing problems. You may have even hired your own Business Manager who, by now, makes almost as much as you do.

But things still aren't running as smoothly as you like.

For over 10 years we've been serving physicians like yourself with a sensible approach to billing designed to maximize their returns.

We've seen a lot of billing systems, experimented with quite a few and have come to one conclusion:

Executive Director's Newsletter

February, 1979

DEFINITION OF PHYSICIAN ASSISTANTS' SUPERVISION	<p>The Board of Medical Examiners has advised the following in connection with the definition of supervision of Physician Assistants:</p> <p>"It is the position of the Board that supervision of non-physician practitioners means "direct supervision," i.e. on-the-spot or on-the-premises and does not mean indirect supervision. It was not intended, nor is it now intended that the non-physician practitioner be placed in a position to make independent decisions regarding diagnoses or treatment of the ill patient. Under circumstances as stated in the individual job description, the non-physician practitioner may be assigned duties according to a prepared protocol, he/she may transmit specific orders from the physician given by telephone but the regulations state that 'no physician may delegate the ultimate responsibility for diagnosis or therapy.' Since the delegation of duties does not relieve the physician of his primary responsibility to the patient for his care and treatment, the physician must maintain direct supervision."</p>
AWARD MADE	<p>William L. Stewart, MD, formerly of Westminster, Maryland, and now Chairman of the Department of Family Practice at the Southern Illinois University School of Medicine, has been awarded the Thomas W. Johnson Award for Outstanding Contribution to Family Practice. The award was made in San Francisco at the Congress of Delegates meeting.</p>
CYTOPATHOLOGY REFRESHER COURSE	<p>April 23-May 4, 1979, are the dates for the Twentieth Post-graduate Institute for Pathologists in Clinical Cytopathology to be held at the Johns Hopkins Hospital and The Johns Hopkins University School of Medicine.</p> <p>The program designed for Board eligible or certified Pathologists or equivalents, is an intensive refresher in all aspects of this clinical area. Newer techniques, special problems and recent applications will be covered in lectures, explored in informal conferences and discussed over the microscope with the Faculty. Self-instructional material will be available to augment at individual pace. A loan set of slides with text will be sent to each participant for home-study during March and April before the Institute. Credit hours - 120 in AMA Category 1.</p> <p>Application is to be made before February 28, 1979. For details, write to John K. Frost, M.D., 610 Pathology Building, The Johns Hopkins Hospital, Baltimore, Maryland 21205.</p>

NEW LAWS, RULES
AND REGULATIONS

The latest issue of Laws, Rules and Regulations With Which Physicians Must Comply is now available on request. This latest compendium has been modified over previous issues with deletion of outdated material and references only to lengthy opinions that can be obtained also on request.

ANNUAL MEETING

DATES

The Annual Meeting in 1979 will be extended by one-half day. The meeting will commence on Wednesday, May 2, 1979, at 9:30 AM with the customary House of Delegates session and will adjourn on Saturday morning, May 5, 1979, with the concluding House session.

The Presidential Dinner will take place on Friday evening, May 4, 1979, following the scientific sessions which will conclude in the late afternoon that same day.

Full details will be in the mail shortly to all members.

RESOLUTIONS

DEADLINE

The bylaws of the Faculty provide that resolutions to be submitted to the House of Delegates at the Faculty's Annual Meeting must be in the Faculty office eight weeks before the date of the Annual Meeting.

The dates for the Annual Meeting are May 2 through 5, 1979; therefore, resolutions must be in our hands by

FRIDAY, MARCH 9, 1979.

MEDICAL GROUP

MANAGEMENT

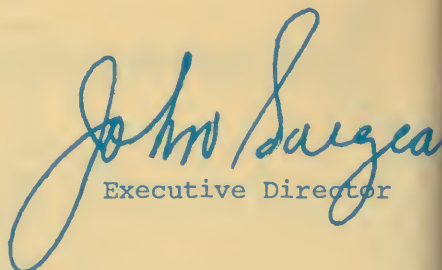

ASSOCIATION

Raymond G. Hohman, Jr., current president of this organization, has advised that some 50 persons are members of the group. Covering the Maryland/DC area, programs for five meetings during 1979 have been established. Further information can be obtained from Mr. Hohman at 4940 Eastern Avenue, Baltimore, Maryland, 21224, phone 342-2813.

Chapter 13: Care of the Insane in Maryland, 1841

Dr. A.C. Robinson's 1841 report on the insane at the Baltimore Alms House is important because it reveals so clearly the current theories, classification, treatment and prognosis of the mentally-ill.¹

Alexander C. Robinson (1810–71) (AB, Yale, 1830; MD, Maryland, 1832) was a visiting physician at the Alms House for many years.² In 1841, on the death of William Nelson Baker (1811–41), lecturer in Anatomy, N.R. Smith urged the candidacy of Dr. Robinson for this position, but others believed he lacked experience.³

In the report, Robinson is much influenced by English (Ellis) and French (Esquirol and Pinel) views on the care of the insane.⁴ He also quotes extensively from the 1833 Annual Report of the Worcester State Lunatic Asylum.

Theory of Insanity

He looks on insanity as the result of "astonishing thought, that they (the insane) are neither able properly to direct or control." He does not attempt diagnostic classification. In the Table showing the list of patients, their behavior is described, rather than classified.⁴ Thus, he differs from Benjamin Rush, who attempted to fit all insane patients into diagnostic categories. The influence of the French and English clinicians is also shown in his emphasis on the personal comfort, need for intelligent attendants and appropriate occupations and amusements for the inmates. This was a manifestation of "moral" treatment advocated by Philippe Pinel (1755–1826) in France and William Tuke (1732–1822) in England. "Moral" meant psychological or non-organic. It was a result of the change in attitude toward man's responsibility for his acts.

The old idea that a man was possessed by devils, and somehow guilty, changed to a belief that the insane person was unable to control himself, and therefore not guilty and should not be punished.⁵

Method of Treatment of Patients

Essentially, Robinson followed the precepts of "moral" treatment: personal involvement with the patients, pleasant surroundings, intelligent attendants and special architectural features for patients having different problems. Furthermore, each patient should be kept as busy as possible: working on the farm if inoffensive and able-bodied; confined if violent. Occupation and amusement should be available where needed.⁶

Prognosis for Cure of the Insane

Robinson acknowledged the poor outlook for many of

the insane. He concentrated on the cures which occur in those with recent onset of insanity.

Need for Pauper State Lunatic Asylum

Because of the mixture of all types of patients, needing different kinds of restraint and different occupations, Robinson felt that the Alms House was an inappropriate place for the insane, and recommended a State institution.

It was possible to segregate the black patients, but not the different categories of insane.

Taken as a whole, Robinson's report is an accurate description of care and treatment of the insane in Maryland just prior to the Civil War.

Jan. 20, 1841—Abstracts from "*The Report of The Lunatic Department of the Baltimore Alms House*," presented by A.C. Robinson, MD.¹

Gentlemen:

The arrival of a period appointed for your annual report of the condition and conduct of this Institution—benevolently designed for the accommodation of the Poor for our city and county—has suggested the propriety of presenting the accompanying statement relating to the insane inmates, to its various particulars your attention is solicited.

You will all probably coincide in the opinion that the insane department is the only portion of this institution calculated to produce other than grateful impressions upon benevolent minds. From the want of a more suitable place for accommodation of pauper lunatics, they are necessarily transferred into the Alms House; consequently, we have here presented to us the melancholy spectacle of cases of nearly all the varied forms of mental disease crowded in unclassified confusion.

Yet, most of the sufferers give some evidence that high mental and moral attributes still linger about them, fenestrating the gloom, "beams of Original light, of which the mind in its thickest darkness is never shorn" which seem to dwell even in "the dark grandeur of the soul" of the raving maniacs.

It is a well-known fact that the insane are often possessed of astonishing thought, that they are neither able properly to direct or control. It therefore becomes necessary that they should be deprived of facilities of escape, or opportunities of injuring themselves or others. Moreover, although medical skill is very important in the management of the peculiar disorder of their

nervous systems, it is no less necessary that, when confined, their apartment should be well-warmed, lighted and ventilated; their personal comforts studiously regarded and their morbidly sensitive minds gently checked and fortified by experienced, intelligent attendants, whose "consideration of convenience" should always be subservient to the probabilities of cure. The architectural unfitness of the building for the accommodation of lunatics need not be argued. It was not originally designed for their habitation and does not now afford the means of either secluding or classifying them, according to the intensity of peculiar features assumed by their maladies.

This report is made with the hope that you will agree as to the necessity and propriety of again urging upon the city and county the cruelty of that false economy which still refuses to take measures to place our insane poor where the architectural arrangements are so suited to the accommodation of lunatics, as to permit any advisable classification of the patients, while its internal arrangements afford humane, watchful and capable nurses, with such appropriate amusements and occupations for the insane as when aided by medical skill may prove promotive of their comfort and cure.

Heretofore, every practicable scheme to promote the comfort of these unfortunates—consistent with the purposes and arrangements of the house, as a general asylum for the poor, in which point of view we bear comparison with any other in the country—has been cheerfully adopted. Some of the insane are employed on the farms; such as are inoffensive and manifest no disposition to escape are allowed in good weather to exercise during the day in a small yard, designed for their exclusive use under the late arrangement of the grounds, suggested by Mr. McGuire, the Overseer.

Another class are furious, violent and ungovernable or such as take advantage of every chance to escape, are constantly in their small apartments, under the charge of temporary nurses, selected from the inmates of the House. There are two sorts of cells, those most recently erected being 8' by 12', those first constructed 10' by 12'. From these limited number, (14 cells being appropriated for female lunatics, and 12 to the male) and from the circumstance, that persons committed as vagrants are sent from the city and county to the Alms House, as a workhouse, it is impossible to afford each lunatic a separate room; two, three or more are confined together. The cells in the basement of the building now being erected as an Hospital for the colored women will somewhat enlarge their accommodation; still, they cannot be appropriately lodged—and their number is added to by frequent admissions.

Among them almost every form of insanity has a representation of its terrors; yet, how much less enervable must be the situation of the lunatics shut up in the Alms Houses and jails of the several counties of the state, or of such as remained chained in the hovels of poor relatives, who cannot be persuaded to entrust them to the charge of strangers! If insanity does not yield with more promptness than ordinary diseases, at least as large a proportion of recoveries will occur in recent cases under an appropriate medical, moral and intellectual

treatment as from any other acute diseases of equal severity something more than 90% of recent cases and from 14-25% of old cases having been cured. This encouraging truth, together with the fact that the chances of relief diminish in a geometrical ratio with the period of duration of the attack, show the importance of an early application of medical aid and cannot be too generally known.

The insane mind, not recognizing the justice or necessity of it, feels with morbid distinctness any form of personal restraint, and in the absence of occupation or amusement to relieve the irksomeness of confinement, it grows unhappy, discontented and restless, unless somehow its unfavorable influence is manifested by a functional disorder, sleep and appetite are banished, the illusions are aggravated, the idea of outrage, indignity and privation engrosses the mind, till lashed into fury; its ravings only cease with physical exhaustion.

This cannot now be termed a novel mode of treating insanity. It was introduced in France upwards of 50 years ago with triumphant success, superseding the coercive system, the standard remedies of which industriously applied "Have precipitated thousands of intellects from a condition of temporary danger to one of irretrievable ruin." When the functions of the brain and general nervous system are disordered resulting in irregularity of action and chronic delirium, can fetters, cheerless confinement, absence of occupation and increasing tumult recall harmonious action, and assist the recuperative energies of the mind to restore "An immortal native capacity of virtue, and the enjoyments of happiness?"

Every enlightened mind, every human heart will respond in the negative. Thus, why is our state so backward in providing a home for her destitute insane, where medical skill may unite with intelligent benevolence in a work of allaying the morbid excitement of the brain and regulating the disordered action of a chaotic intellect, recalling reason and reawakening all its natural sympathy?

To this class of her citizens, she is long in arrears!

Among the measures conducive to a favorable result, no one is more important than the principle of never allowing a patient to continue idle, if at all, in a condition of general health.

The mental revulsion induced by labor prevents the mortal illusions of the real or fancied suffering from wholly engrossing the attention, gardening, farming or mechanical operations, particularly if the patient has been accustomed to these, encourage cheerfulness and contentment, promoting at the same time refreshing sleep and appetite, the breath becomes improved and the mind invigorates. The anticipation of the benefits of labor, or the contemplation of its results, is also effective in awakening a feeling of satisfaction and self-respect, which greatly aids the patient in controlling any disposition to violence and indecency, and in banishing unpleasant impressions and feeling of irritation and degradation.

Of course, during the vesicular and nervous excitement frequently existing in the early stages, rest, seclusion and quiet will best allay diseased irritability of

body and mind, but as this disappears, exercise and employment viable to the condition of the patient, promotes convalescence and strengthens the mental and bodily powers, greatly aiding the medicinal treatment in removing the functional derangement in that portion of the physical system—the brain and nerves—which causes insanity.

We might also quote evidence to the beneficial influence of introducing Sabbath services within the confines of the asylum, judicially arranged and conducted; and that a large proportion of the patients are pleased if allowed to attend and behave with great propriety. But we have already far exceeded our prescribed limits, and must (assign) the subject to the charge of a more able and experienced advocate. It cannot be necessary to dwell longer upon the incharitableness of sending our maniac paupers into almshouses, where it is impractical to command the varied and nicely adjusted means best calculated to recall and reestablish physical and mental health. What inconceivable good might have resulted from the expenditure of a comparatively inconsequential sum years ago in the establishment of a state lunatic asylum—a large proportion of those who must now be a burden upon the community as long as they live might have been restored to their families to happiness and to usefulness?

When insanity was scarcely looked upon as a legitimate subject for curative treatment, almshouses were selected as suitable places for the safe confinement of these unfortunate subjects of it, but are they to be so regarded now? We trust not. Convinced that the want

of a well-endowed Pauper State Lunatic Asylum is a serious evil, the magnitude of which should be pressed upon the notice of our people and our government, we venture thus to entreat you earnestly to plead for its removal; feeling assured that the intelligent body of a people whose enterprise and determination to do all in their power to promote the true and permanent interests of their state and fellow citizens at large have induced the expenditures of millions in roads, canals and various other internal improvements, will probably respond to the cry for relief and advocate the desired provision for their destitute and insane if made to comprehend its necessity.

Such an institution assuming a high rank among our state enterprises would prove a blessing to a helpless and heretofore neglected class of our people and continue an admired monument of her benevolence.

Presidential Meeting

On Nov. 29, 1978, a meeting was held at the Faculty Building on Cathedral St. in Baltimore for the Presidents of the Component and Specialty Societies.

Your President was invited to attend the meeting to speak about the Auxiliary and its activities; however, I learned more from listening than speaking. Approximately 16 Chairmen reported on the activities of their Committees. All of the problems concerning medicine were put forth, all of the work yet to be accomplished was explained. It was my regret that the spouses of the physicians attending could not have been there so they could understand how they can help medicine with the challenges that are coming. Important decisions are being made about the future of medicine and health care delivery, and most of us are not even aware of it.

A specific area of challenge is PSRO (Professional Standards Review Organization). Six years ago the PSRO program was mandated by the Congress of the United States. This organization gives physicians a mechanism to regulate the health industry through peer review at the local level. Physicians and their spouses must become aware of their responsibilities under the PSRO law. If they fail to respond, the alternative is stated in the **Congressional Record**, "The Government should not have to review medical determination unless the medical profession evidences an unwillingness to properly assume the task."

There are six PSROs in the Maryland area. They are Baltimore County, Montgomery County, Prince George's County, Southern Maryland, Eastern Shore and Central Maryland. They have been identifying problems in acute care hospitals and long-term care facilities. This is being done to improve care, to keep medicine costs down and to "Assure the American taxpayer that tax dollars are being spent for medically-necessary services."

Many dedicated physicians are giving their valuable time to run PSRO committees. They are eager to help other physicians attain a cost-effective, quality care practice.

We Auxiliary members should educate ourselves as to the impact of Public Law 93-641 on our spouse's profession. We must learn about HSAs, their projected health plans, the makeup of their boards and Health Services Cost Review Commissions in our own communities.

CONRAD ACTON, MD, Editor

October General Meeting

The October, 1978 General Meeting took up business matters first. Our Nominating Committee's recommendations were well-received. A few nominations from the floor were made.

A report by the Peer Review Committee reviewed its activity of the past two years. Noting that their charge was to rehabilitate and educate rather than punish, they take pride in the small number of physicians, after being interviewed by the Committee, who need to be referred to higher authority for disciplinary action. Only two of the eight so reported out actually had to undergo discipline of one sort or another.

Dr. DeHoff Speaks

Baltimore City's Health Commissioner, John Burling DeHoff, MD, spoke of the importance of notifying the Health Department of reportable diseases. Baltimore physicians seem extremely forgetful, loth to get involved, or both, according to his data. Without adequate and prompt notification, though, Health Department strategies to deal with infectious disease problems to cure and prevent spread—and proper logistics for detection and treatment—will be inadequate. He reminded us that there are four categories of reportable conditions: 1) Communicable Disease of any kind; 2) Industrial Disease due to occupational exposure to harmful substances; 3) Bites or wounds from any animal, wild or tame and 4) Poisonings by food or chemical, intentional or accidental.

Dr. Stevens' Address

Diagnosis, Treatment and Surgical Aspects of Rheumatoid Arthritis was the topic of the scientific portion of the Meeting. Mary Betty Stevens, MD, Director of the Rheumatology Division at Baltimore's Good Samaritan Hospital, summarized various diagnostic aspects and pitfalls. With striking pictures and her rapid-fire delivery, she pointed out early and late manifestations of three main types. These were those: a) With joints involved only, b) Joints and another system involved and c) Joints with general systemic involvement. Humoral factors, X-ray variations and other laboratory findings were compared. Most tests are not specific. "Questions of diagnosis never end—they just change; one cannot outguess the future."

Dr. Klinefelter

Harry F. Klinefelter, MD, Associate Professor of Medicine at the Johns Hopkins Medical School, has his keystone of treatment in patient education. Arthritic patients **need** to be informed about the treatments used, what they are and what to expect from them. Modalities directed toward, in order of importance, should be for focal infection, nutrition, psychotherapy, physical therapy, medication and necessary surgery. He sorted medications into major categories: analgesia, anti-inflammatory and antirheumatic. He noted that spontaneous remissions are so frequent that it is difficult to determine whether any improvement is really due to the medication or would have occurred on its own.

Next, Dr. Hungerford. . .

David S. Hungerford, MD, Chief of Orthopedic Service at Good Samaritan Hospital, outlined the surgeon's role as not limited to operating, in rheumatoid diseases. It includes also splinting, protecting weight-bearing areas from pain and relieving deformity. Joint replacement is spectacular when it succeeds or fails. It should be used **only** to relieve pain, because the joint is destroyed after surgery. The loss of structural integrity cannot be regained. Most people have unrealistic expectations, especially about ensuing relief of pain. Patients must be fully aware of the negative aspects of joint replacement—mainly infection and cement failure. Bone cement is the technical weak link in the total replacement procedures. Other measures are being developed; one is joint resurfacing.

Board of Directors Meets

The Board of Directors tangled with a full agenda on Dec. 21, 1978. The Public Health Committee reported from its Jail Subcommittee that the Baltimore City Jail has been fully accredited by the AMA for its inmate health care facilities. The Subcommittee's members have worked very hard to bring this about. An award will be made formally at our Annual Meeting.

The Professional Education Committee recommended cooperation with Assist-Card International. They want to obtain names of multilingual physicians, especially those fluent in Spanish and/or French. Assist-Cards

are purchased by visitors coming to the US when they make their travel arrangements. Medical care is included as one of the benefits of the program. Medical insurance on Assist-Card holders is covered by Lloyds of London. A list of cooperating physicians is maintained at the offices for Assist-Card in Boston. When a traveller needs a physician, one in the appropriate specialty is contacted who can speak the traveller's language. The Directors approved a call for volunteers through our Newsletter.

Report from the Ad Hoc Committee on establishing a Medical Advisory Committee to the Ambulance Service of the Fire Department gave the outline of the Advisory Committee's present organization and charge. The Fire Department is to provide the administrative staff. Eight physicians have been proposed for selection by Baltimore's Mayor Schaefer. The Directors felt that these seem to be heavily-weighted toward emergency room specialists. There is one psychiatrist and none for alcoholism or drug abuse. Since alcoholics, addicts and psychotics constitute a very large portion of ambulance service passengers, it was felt by the Directors that the Advisory Committee should have experts in these fields as well.

New Study

The Health Care Delivery Committee proposes a study be made of primary health care delivery by private practitioners in Baltimore. They have found a doctoral student who proposes to do this. Already submitted

is a rough draft of **An Investigation of the Availability and Accessibility of Office-Based Primary Care in Baltimore City.** It begins: "Primary care should be considered the foundation of any comprehensive system of health care delivery. It can be defined as the level of entry into the system where basic health services are provided in a holistic fashion. The primary care practitioner is considered a generalist who does not limit his/her practice by type of condition or organ system. When assessing the distributional equity of any health service in any geographic area, two specific yet related issues must be considered. Firstly, services must be available as a prerequisite to their utilization. Secondly, a patient must experience unhampered access to that service if it is to be utilized."

The Directors supported this concept and agreed that they would allocate funds to sponsor it. ☐

Council Inaugurates William Osler Associates Program

At its meeting on Nov. 30, 1978, the Med-Chi Council established the William Osler Associates, a program to endow in perpetuity journal titles in the Faculty Library. For \$1,500 payable over a three-year period, one can endow a selected journal and at the same time honor a living person, or memorialize one who has passed on. The income from the principal will be used to defray costs of subscriptions, binding and maintenance. In the future, each volume of the selected journal will be suitably bookplated with a special William Osler Associates bookplate bearing the name of the donor. In addition, each donor will receive a certificate commemorating his participation in the program. Component and specialty societies, and other groups, are also welcome to participate.

Other Endowments. . .

The Library now has 14 endowments. The income from these has been adequate for the Library's journal subscriptions and new book purchases for some time, but inflation and a rapid increase in the cost of medical books and journals require that the Library either cut back its new book purchases and journal subscriptions or find additional sources of income. The average price of a one-year subscription to a US medical journal has increased from \$19.38 in 1968 to \$57.06 in 1978.

Success of the William Osler Associates program would greatly relieve the growing pressure on the Library's book and journal budget. The program offers an easy way for Faculty members to make significant contributions to continued maintenance of the Library (and contributions are tax-deductible!) so, please consider joining the Associates.

If the amount seems impractical at this time, you may wish to consider a bequest to the Associate program in your will. Your lawyer can advise you on how to do this.

Of course, gifts in lesser (or greater) amounts for the support and maintenance of the Faculty Library, or for the purchase of volumes to honor persons living or dead, continue to be welcome.

For additional information about the William Osler Associates program, or about contributions to the Faculty Library, please contact me.

JOSEPH E. JENSEN
Librarian

Gifts and Contributions

The Library gratefully acknowledges the receipt of the following gifts and contributions during October and November, 1978:

Samuel Morrison, MD

A collection of medical textbooks and medical instruments.

Frank J. Ayd, Jr., MD

An autographed copy of his recent book, **Mood Disorders, the World's Major Public Health Problem.**

Charles Lee Randol, MD

Four medical textbooks.

John H. Hirschfeld, MD

Twelve medical textbooks and a large number of medical periodicals.

Mrs. M. Bickel

Twenty-four medical textbooks.

Stanley R. Steinhach, MD

Twenty-six Audiocassette tapes.

George McLean, MD

Thirty medical yearbooks.

Gifts of medical periodicals and reprints, medical texts (especially **old** medical texts) and medical instruments are always welcomed, as are personal contributions.

Contact Mr. Joseph E. Jensen, Librarian.

NEOSPORIN® Ointment

(Polymyxin B-Bacitracin-Neomycin)

Burroughs Wellcome Co.
Research Triangle Park
North Carolina 27709

Each gram contains: Aerosporin® (Polymyxin B Sulfate) 5,000 units, bacitracin zinc 400 units, neomycin sulfate 5 mg (equivalent to 3.5 mg neomycin base), special white petrolatum qs; in tubes of 1 oz and 1/2 oz and 1/32 oz (approx.) foil packets.

INDICATIONS: *Therapeutically*, (as an adjunct to systemic therapy when indicated), for topical infections, primary or secondary, due to susceptible organisms, as in: infected burns, skin grafts, surgical incisions, otitis externa; primary pyodermas (impetigo, ecthyma, sycosis vulgaris, paronychia); secondarily infected dermatoses (eczema, herpes, and seborrheic dermatitis); traumatic lesions, inflamed or suppurating as a result of bacterial infection. *Prophylactically*, the

ointment may be used to prevent bacterial contamination in burns, skin grafts, incisions, and other clean lesions. For abrasions, minor cuts and wounds accidentally incurred, its use may prevent the development of infection and permit wound healing.

CONTRAINDICATIONS: This product is contraindicated in those individuals who have shown hypersensitivity to any of its components. Do not use in the eyes or in the external ear canal if the eardrum is perforated.

WARNING: Because of the potential hazard of nephrotoxicity and ototoxicity due to neomycin, care should be exercised when using this product in treating extensive burns, trophic ulceration and other extensive conditions where absorption of neomycin is possible. In burns where more than 20 percent of the body surface is affected, especially if the patient has impaired renal function or is receiving other aminoglycoside antibiotics concurrently, not more than one application a day is recommended.

When using neomycin-containing products to control

secondary infection in the chronic dermatoses, it should be borne in mind that the skin is more liable to become sensitized to many substances, including neomycin. The manifestation of sensitization to neomycin is usually a low grade reddening with swelling, dry scaling and itching; it may be manifest simply as failure to heal. During long-term use of neomycin-containing products, periodic examination for such signs is advisable and the patient should be told to discontinue the product if they are observed. These symptoms regress quickly on withdrawing the medication. Neomycin-containing applications should be avoided for that patient thereafter.

PRECAUTIONS: As with other antibacterial preparations, prolonged use may result in overgrowth of nonsusceptible organisms, including fungi. Appropriate measures should be taken if this occurs.

ADVERSE REACTIONS: Neomycin is a not uncommon cutaneous sensitizer. Articles in the current literature indicate an increase in the prevalence of persons allergic to neomycin. Ototoxicity and nephrotoxicity have been reported (see Warning section).

Health in History

Was "Jack the Ripper" Heir to the British Throne? A New Book Says "Yes!"

By BLAINE TAYLOR

Contact Mr. Taylor, *Journal* Managing Editor, for reprint and other data c/o the *Journal*, 1211 Cathedral St., Balto., MD 21201.

Introduction

On the night of Sept. 30, 1888, London Police Constable Edward Watkins discovered a murdered prostitute lying in a pool of blood in a darkened square. 'She was lying on her back; at least what remained of her. She had been ripped apart, as he later related, 'like a pig in a market,' with her face smashed in and her entrails thrust in a heap around her neck. . . he screamed to the nightwatchman. . . ' For God's sake help me—there's a woman. She's been cut to pieces."¹

The occurrence was another in a series of six bizarre murders of British whores killed (all of them brutally disembowled) in London's sleazy East End between Aug. 31, 1888 - Feb. 13, 1891 (five were in 1888)² that have come down to history as the "Jack the Ripper" killings (so-called because of a note sent to a British news agency signed in that fashion).³

From the time the murders ended rather abruptly (without the public being convinced that Scotland Yard had ever truly apprehended the culprit) until 1970, the identity of the murderer was shrouded in mystery and doubt. In that year, however, a British physician — Thomas E. A. Stowell, CBE, MD, FRCS, DIH—published an article entitled "Jack the Ripper" — A Solution? in the British periodical, *The Criminologist* (available through the Med-Chi Library) in which he made sensational allusions that the killer was, in reality, none other than Prince Albert Victor Christian Edward (nicknamed "Eddy"), Duke of Clarence and Avondale, grandson of Queen Victoria, elder brother of King George V and son of King Edward VII (see "Bertie" — Britain's King Edward VII, *Journal*, September, 1978, p. 21), heir to the throne of Great Britain, who — historically, at least — is said to have died at age 28 on "Jan. 14, 1892, after a sudden attack of influenza."⁴

Author Frank Spiering has now followed-up Dr. Stowell's research with his own, and the result is an engaging little book (192 pages, 22 photographs and illustrations, plus a map of the murder sites) that flatly and unhesitatingly names the Prince as Jack and claims in addition that a) Queen Victoria's physician, Sir William Gull; the then-Prince of Wales, Edward; British Prime Minister Lord Salisbury and London Police Commissioner Sir Charles Warren all knew the

murderer's identity in 1888, b) they conspired to murder both the Prince and his homosexual tutor/lover, James Stephen in an attempt to cover-up and distort history and c) that Dr. Stowell himself may've been murdered (he died Nov. 8, 1970) by insidious government forces in reprisal for his *Criminologist* article.

Moreover, states Mr. Spiering — and of profound importance for the impact that health apparently has on history — "Prince Eddy, alias Jack the Ripper, shook the concept of 'the exaltation of Royalty' to its foundations. At that point, 'the Court,' headed by Lord Salisbury, stepped forward to reinforce the station of the Monarchy by ridding it of its greatest threat. In exchange for disposing of Eddy, 'the Court' has dictated to the Royal Family ever since." The author believes the heirs of the courtesan powers of the 1890s forced the abdication of King Edward VIII in 1936 (over Baltimore divorcee Wallis Simpson) and in the 1950s prevented Princess Margaret from marrying divorced Royal Air Force hero Peter Townshend. . . .⁵ "The power of England's rulers ended with Victoria, but more pertinently, it ended because of her grandson."⁶ This last view is somewhat at variance with my own research and findings, as reported in the *Journal*, however:

In terms of actually wielding true power, Edward VII was the last reigning British sovereign: his son and successor, George V, began the tradition of British rulers being completely subservient to Parliament and its political parties that has come down to us over the years and which exists today in the person of Queen Elizabeth II, King Edward's great granddaughter."⁷

(Edward ruled from 1901-10, and George V—his second son—from then until his death in 1936.)

Whether the discerning reader believes it or not, Spiering's book (also available in the Med-Chi Library, as well as at local bookstores) is a thrilling blend of dramatic detective work, fastpaced writing and historic facts, but before going further into a more detailed review of *Prince Jack*, let's pause a bit and take a brief look at Eddy's prior and rather sketchy place in the annals concerning this period in British history.

The Flawed Princeling

He is mentioned in all the major biographies of his illustrious father, King Edward VII. Born prematurely on Jan. 8, 1864,⁸ Eddy is described as rather backward

in Uncle of Europe: The Social and Diplomatic Life of Edward VII:

"Prince Eddy was a calamity for any parent to have to contemplate. Physically, he was almost as unattractive as the two elder sisters. Mentally, he was the dimmest of all the children, so dim and lethargic that his tutor, the Reverend Dalton, had to write him off as incapable of being educated. Morally, he was as dissolute as any of those Hanoverian great-great-uncles. Worse perhaps, for later generations were to indulge in the horrifying speculation that Jack the Ripper, that notorious, never-discovered murderer of London prostitutes in the 1880s, might have been none other than the Duke of Clarence. The mere fact that this fancy could even be floated demonstrates the unwholesome power of the legend he left behind him. It was perhaps a blessing for his parents, and certainly a blessing for the English crown, when this elder son of the Heir-Apparent died at Sandringham. . ."⁹

The puckish 1975 study — *Edward the Rake: An Unwholesome Biography of Edward VII* — says of Eddy:

"He combined extraordinary backwardness at work with still more extraordinary forwardness with women. Eddy had failed consistently at military academy and also got himself mixed up with women of low company. In this he never showed any of his father's tact or sense of discretion or decorum. Unlike his younger brother George—a stalwart lad and great favorite of his father's—Eddy was such a menace that the Prince was in despair. His irresponsibility and near idiocy were such that if news of them got out the future of the British Royal Family would look grim indeed. A rakish heir was bad enough; when he, in turn, possessed a son like Eddy, there could not be much hope for the continued popularity of monarchy in Britain. Bertie was keen to banish him—in true Victorian style—on a

long, absorbing tour of the colonies, but he was hardly in the position to play the heavy father. Interestingly enough, it was Alexandra who appeared more understanding. Perhaps she knew far less about what he had been up to, but thanks to her, Bertie agreed to let him stay in England with his regiment and then become engaged to young Princess May of Teck the following spring. As in his own case, 30 years before, it was felt that all that the young man needed was a wife. . ."¹⁰

"When his eldest son died, Bertie wept."¹¹

Still another Edwardian biographer—Christopher Hibbert—wrote in his 1976 portrait, *The Royal Victorians: King Edward VII, His Family and Friends*:

"Prince Eddy afforded his father no satisfaction. He 'sits listless and vacant,' Dalton reported, 'and. . .wastes as much time in doing nothing, as he ever wasted. This weakness of brain, this feebleness and lack of power to grasp almost anything put before him, is manifested. . .also in his hours of recreation and social intercourse.' After disembarking from the *Bacchante* for the last time, the boy, then aged 18, was sent to Lausanne to learn French, an undertaking totally beyond his powers. He was then entered at Trinity College, Cambridge, although in the opinion of J.K. Stephen, who had gone to Sandringham to help to cram him for the ordeal, he could not 'possibly derive much benefit' from attending university lectures, since he hardly knew 'the meaning of the words 'to read.' However, as a tribute to his birth rather than his intellect—which was not in the least stimulated by university studies and no doubt hampered by his being rather deaf—he was granted an honorary LLD, in 1888.

"He was not an unattractive young man. Edward Hamilton, who played bowls and billiards with him at Sandringham when he was 20, described him as 'a pleasing young fellow, natural and un-stuck-up.' Sir Lionel Cust thought that he had inherited much from his mother, to whom he was devoted, and that he might one day win the nation's heart as she had done. Prince Eddy confessed, however, to being rather afraid of his father, and aware that he was not quite up to what his father expected of him. He was extremely polite in his manner, modest, equable and deferential to his elders, particularly to his grandmother. In her turn, Queen Victoria regarded him with affection: he was a 'dear good simple boy,' dutiful and even steadily inclined; she loved him 'so dearly, she told Lady Downe,' an affection he returned so warmly. The Queen's secretary, Sir Henry Ponsonby, thought that, although his sentences were inclined to 'tail off' as though he had forgotten what he was going to say, Prince Eddy could talk quite sensibly when he chose and would be popular when he got 'more of his ease,' but he was certainly incapable of applying himself to anything for 'a length of time, and when he was bored, his perpetual fidgeting seemed like a nervous tic. He was, in fact, constitutionally incapable of concentration, except on whist, which he played quite well, and on polo, at which he was adept. As he grew older, he appeared only to be fully alive when indulging his strongly-developed sensuality. Despite a somewhat droopy cast of countenance, he was quite good looking and was undoubtedly attractive to women.

"Since he had evinced not the least enthusiasm for either the Navy or for Cambridge, it was now decided that Prince Eddy should go into the Army, but at first he showed no aptitude for that either. His instructor at Aldershot was 'quite astounded at his utter ignorance. When the Commander-in-Chief came down on a tour of inspection, he expressed the hope of seeing him perform 'some most elementary movement, but the Colonel 'begged him not to attempt it as the Prince had not an idea how to do it! And the (Commander-in-Chief) not wishing to expose him, let it alone!' His slowness was overlooked, however, and in time he did become moderately efficient. When he was 22, he was given a commission in the 10th Hussars. He did at least like the uniform, since he had always taken a great interest in clothes and, despite his lackadaisical demeanour, dressed him-

THE PRINCE (from *Prince Jack*.)

self with the utmost care. Always smart to the point of dandification, he was nicknamed 'Collar and Cuffs.'

"Prince Eddy returned from a trip to India in 1890 worn out and 'really quite ill' from the dissipated life he had been leading. Then, to compound his folly, he fell in love with Princess Helene d'Orleans, who was not only a Roman Catholic but daughter of the Comte de Paris, a pretender to the French throne. Before falling in love with her, Prince Eddy—or the Duke of Clarence and Avondale as he became in May, 1890—had wanted to marry Princess Alix of Hesse, but she would not consider him. He had then been asked to think about another cousin, Princess Margaret of Prussia, but he declined to consider her."¹²

"It was not, however, in Prince Eddy's nature to wait and see. Obligated to separate from Princess Helene, he found that, although 'quite wretched' for a time, absence did not make his heart grow fonder and that he was, after all, in love with Lady Sybil St. Clair Erskine, but this was not an acceptable match either, so the search continued for a suitable bride who might help to keep the dissipated bachelor out of further trouble. Where, though, his father asked, was 'a good sensible wife' with the necessary strength of character to be found?"¹³

"Fortunately, by this time, another possible bride had entered the lists, Princess May of Teck, a sensible, dutiful young woman whose virtues were held to outweigh the disadvantages of having a mother who was excessively slapdash and a bad-tempered father whose mind had been unbalanced by a stroke. So Princess Alexandra decided that Prince Eddy should marry Princess May and, in the meantime, remain with his regiment as she had wanted. The next day she sailed for Denmark. . .

"In her absence, negotiations for Prince Eddy's marriage progressed smoothly. Amenable as always, he complaisantly accepted Princess May, proposed to her at a house-party at Luton Hoo and was accepted. The wedding was fixed for Feb. 27, 1892, a few weeks after the bridegroom's 28th birthday.

"His father expressed the greatest satisfaction and relief. . . The Prince's contentment did not, however, last long. Soon after Christmas, Prince Eddy, pale and shivering, returned from a day's shooting with his father at Sandringham and went to bed with a bad headache that presaged the onset of influenza. He came downstairs on his birthday to look at his presents, but felt too ill to stay long and went back to bed. His mother watched him climb the stairs, and never afterwards forgot the way he turned to give her 'his friendly nod.' Soon afterwards, seriously ill with pneumonia, he became delirious, and on Jan. 13th, his mother, who had sat by his bedside all night, woke her husband to tell him that she believed their son was dying.

"The Prince would not at first believe it. Taking comfort from the specialist who felt that there was still some hope, he constantly appeared at the door of the sickroom, looking anxiously in upon his son, who never stopped talking, but with great difficulty and effort,' as his mother said, 'and with that terrible rattle in his throat.' From time to time, it seemed that the Prince's hope might be justified; subcutaneous injections of ether and strychnine brought the patient momentarily round, but then he relapsed again. Princess Alexandra wiped the sweat from his face and neck, and the nurses placed packs of ice on his forehead. At last he cried out, 'Something too awful has happened. My darling brother George is dead.' He then asked, 'Who is that? Who is that? Who is that?' murmuring the question repeatedly until he died.

"The Prince of Wales was grief-stricken, quite 'broken down,' as his mother said. . .

"For years, the hat which Prince Eddy had been wearing when he went out shooting for the last time, and which he had waved to his mother as, glancing back, he had caught sight of her at a window, was kept hanging on a hook in her bedroom. And for years, too, his own room was kept exactly as it had been when he was alive to use it, his tube of toothpaste being preserved as he had left it, the soap in the washbasin being replaced when it mouldered, a Union Jack draped over the bed, and his uniforms displayed behind the glass door of a wardrobe.

"Gladly would I have given my life for his,' the Prince told

his mother, 'as I put no value on mine. . . Such a tragedy has never before occurred in the annals of our family.' Yet he knew in his heart that Prince Eddy had been hopelessly ill-qualified for the position for which his birth had destined him, and it was of inestimable comfort to his father that his new heir, Prince George, who was quite content to marry Princess May, seemed, on the contrary, suited in every way to kingship."¹⁴

Finally, the latest major study on Britain's Royal Family — Robert Lacey's 1977 book, *Majesty: Elizabeth II and the House of Windsor*, adds these comments:

"Eddy was a weak youth, notorious for his sexual adventuring. (It has traditionally been supposed that Prince Eddy, the Duke of Clarence, was homosexual. His name was implicated in the scandal attending the discovery of a male brothel operating in Cleveland St. in the West End of London in 1889, but the release of the long-embargoed papers on the case which involved several eminent figures in late Victorian society appears to indicate that the Prince only visited the brothel once in the expectation of poses plastiques—Victorian for striptease—and was disappointed. H. Montgomery Hyde's recent research into these and related papers does indicate, however, that the Prince was treated at least once for gonorrhoeal infection, though there is no evidence of this in the Queen's Archive.) Quite resolute, and definitely unflappable, the future Queen Mary, then known as Princess May of Teck, seemed the best woman to cope with him, and when the Prince died of pneumonia a few months after they had got engaged, it had seemed logical that Princess May should be recalled to Eddy's younger brother, George; the next in line for the throne. . .¹⁵

"Prince Eddy. . . was an aristocratic delinquent who, had he lived, might well have got into trouble as a result of his sexual adventuring."¹⁶

Spiering's Jack

Author Spiering makes no bones about it—Eddy was Jack and committed all the murders attributed to the near-fabled knifer (a practice of killing, he says, the young Prince viewed first-hand at a London slaughterhouse.)¹⁷ Numerous people—including London Bobbies—actually saw the suspect (he was almost caught in the act at least once) on the streets prior to the murders (carrying a rolled-up newspaper that concealed the butcher's knife used in the slayings, the author feels) with later physical descriptions rendered to detectives: “. . . About 5'8" tall, with a pale complexion, dark hair and a slight moustache curled up at each end) perfectly fitted Eddy”¹⁸ “. . . about 30 years old. . . dressed in something like a Navy serge coat, with a deerstalker's cap. . . the killer wore a red neckerchief. . .”¹⁹

A Sherlockian Connection?

As a Sherlock Holmes adventure fan, one aspect of the Ripper's description—namely the presence of the deerstalker cap—fascinates me, but the possible link was apparently missed by Mr. Spiering. After all, the Holmes pieces began being published in 1885-86 (see *Sherlock Holmes, MD* in the July, 1978 *Journal* on p. 33)²⁰ and, as all true Holmesians know, the central character wore a deerstalker cap. Eddy's father, the Prince of Wales, was a well-known fan of Dr. Doyle's writings,²¹ and isn't it possible that his son was, also? Did he select the deerstalker cap for this reason? Ironically, perhaps, Nigel Morland's Introduction to *Prince Jack* states that Conan Doyle told him that the Ripper was “‘Somewhere in the upper stratum,’ but he would never enlarge on that statement.”²² Doyle was good at keeping official secrets, it should be noted, but the notorious woman-chasing Prince of Wales did appear as a fictional character in at least one Sherlockian tale — *The Adventure of the Illustrious Client*.²³

Eddy's Anti-Semitism

As the police on the beat searched frantically for the unknown killer, suspicion naturally turned onto people who used knives—such as butchers—and the London press (prior to discovering the moniker of Jack the Ripper) christened him “leather apron,”²⁴ since butchers wore these. One person arrested as a suspect was a Polish Jewish shoemaker who was found to have five sharp, long-handled knives in his rooms.²⁵ The news of his arrest led to a burst of public anti-Semitism with mobs accosting innocent Jews on the streets; one, a slaughterhouse workman, was stoned, “Lost his reason and had to be committed to an asylum.”²⁶ In order to distract attention away from himself, Eddy, so author Spiering believes, pandered to this always-latent strain of Victorian anti-Semitism by scrawling a message in chalk on a wall near the scene of one of the grisly murders: “The Juwes (sic) are not the men that will be blamed for nothing.”²⁷

They were blameless, however, the writer asserts, as Jack's true identity had been discovered as early as Sept. 30, 1888—the night of murders number three and four (with two more yet to come)—by London Police

Commissioner Sir Charles Warren, who, acting on a tip from a suspicious officer who'd seen Eddy returning home at 5 AM after one murder, decided to track the Prince himself. “His one course of action was to protect the Royal Family at any cost. It was his duty to the Queen that no one should suspect her grandson,” Spiering writes.²⁸

He further states that Sir Charles immediately instituted an official—though highly-secret—government cover-up by controlling the inquests held in the various murders, replacing coroners who asked too many questions²⁹ and by assigning less policemen to cases rather than more (as ordered by the Queen.)

The cover-up was aided, surprisingly enough claims Spiering, by the Queen's own private physician—Sir William Gull—who the author says, was “One of the great medical pioneers in the use of static electricity to treat nervous diseases.”³⁰

Enter Dr. Gull

Ironically, it was Queen Victoria herself who sent her grandson to see Sir William, who had helped save her son the Prince of Wales from death by typhoid in 1871. In October, 1888—after the first four murders had already been committed, Spiering says, the Queen had Eddy for lunch, noticed he was pale and trembling and so ordered him to see Dr. Gull, which he dutifully did. Upon examination, Eddy's “. . . Appearance revealed symptoms of extreme dementia. . . From the young man's complaint of headaches and the evidence of chronic suppuration about the ear, Gull immediately recognized that he was suffering from syphilitic cachexia.”³¹ (The Prince had contracted syphilis at age 18—in 1882—in Australia.³² As Eddy once told his homosexual lover/tutor, James Stephen (who'd also been treated by Dr. Gull—for a head injury), he'd gotten “sores” from a prostitute.³³

Intrigued by this Royal patient who was in a direct line to someday succeed to the English throne (his father, as King Edward VII, died in 1910, when Eddy would've been only 46), Dr. Gull decided to try what was then considered a rather novel mode of treatment—hypnosis. He was shocked and horrified to discover that his Royal patient was actually the dreaded Jack the Ripper.

“Eddy told him first about James, then about the anger he felt toward his father. Finally, his eyes became like glass as he recalled another image, one that filled Gull with alarm. It was ‘the knife’ he referred to and the woman in the darkness.

“Gull watched in horror as Eddy showed him how he slit the woman's throat. The phantom knife descended with a sudden thrust down.

“‘Why?’ Gull asked.

“But Eddy could only repeat what he had told him. He repeated it as if something inside him were stuck on that image. Finally Gull made him stop. There was no point in going on.

“Sir William Gull had discovered the ‘latent cause’ for Eddy's demented state. The syphilis had thrust him into fits of fantastic rage. Violence was the outpouring of his pain.

“But in Eddy's case, it was not simply fantasy. He had re-enacted the obsessions that he felt. The madness which had overtaken his being was a perpetual state of delirium. He was not mentally responsible, yet the acts had been committed.”³⁴

(Spiering speculates that “. . . a dark madness led him into the streets of Whitechapel to annihilate women he did not know. Except to him, they represented *all* women, as his desire for satisfaction was convoluted into an intense passion to dissect them.”³⁵

Faced with the overwhelming enormity of his terrific discovery, Dr. Gull contacted Sir Charles, only to learn that he, too, had found our Eddy's gruesome pastime.

Jack Confined

Sir Charles told the doctor that the astonishing revelation had already been passed along to Her Majesty's Prime Minister, Lord Salisbury (but never to the Queen herself.) The Police Commissioner and the Court Physician decided to commit Eddy to the House of Rest Sanitarium at Balham, a small village outside London.³⁶ The Prince of Wales was informed by “His own physician, Sir Henry Acland, that his son was suffering from syphilis.”³⁷

Dr. Gull became worried about his patient's deteriorating condition:

“He noted that since his arrival, the Prince did not seem to be awake most of the time. In addition, he was gradually becoming incoherent in his speech, which Gull attributed to aphasia accompanying his condition. This partial loss of power of articulate speech was not due to a defect in the peripheral organs, but to a disorder in one or more of the cerebral centers.

“Within the second week of Eddy's confinement, reports began reaching Gull of a marked change in his disposition. According to the attendants assigned to his case, the Prince, with increasing regularity, was becoming wildly delirious and extremely violent in his actions.

“This state was often common in syphilitic patients, but once again the ‘latent cause’ theory presented itself to Gull. The syphilitic condition could be controlled, but not the inner torment, the madness which had driven this young man to acts of premeditated butchery. This fact would always lie heavily upon the conscience of his protectors, who were now so desperately trying to protect themselves.

“Gull, at 72, was a sick man. His medical career had been radiant with accomplishment, and now he was faced with having to conspire in an act so ignoble and repugnant that it haunted him. To hold an heir to the British throne captive in order to conceal the monstrous deeds for which he was responsible was taking a terrible toll, and the worst was yet to come.”³⁸

During the early morning hours of Nov. 7-8, 1888, in a fit of rage, Eddy escaped.³⁹ The drugs he'd been given had caused “Shooting pains throughout his legs and arms”⁴⁰ and he believed his father was responsible for his confinement, and also felt his tormentors meant to murder him.⁴¹ Nov. 9, 1888 was the Prince of Wales' 47th birthday, and Spiering believes that was why Eddy—as Jack the Ripper—chose that date for the fifth murder, as a sort of macabre birthday present.⁴²

He was apprehended and returned to the sanitarium. In 1889, he was allowed—under guard—to make a State tour of Britain's Indian Empire, and during this time strangely enough, there were no Ripper murders. It was thought, perhaps, that the young Prince could be secretly and quietly rehabilitated, but Dr. Gull, who died of a stroke in 1890,⁴³ knew better. On Feb. 13,

1891, there occurred the sixth and final Ripper murder. Eddy was back in London.⁴⁴

Doom for the Ripper

“On Nov. 21, 1891, James Stephen was committed, by the powers who ruled England, to the lunatic ward of St. Andrew's Hospital, Northampton,”⁴⁵ author Spiering states. Eddy had early-on revealed himself to Stephen by bringing—wrapped up—one of his mutilated victim's organs. Stephen was his closest friend. Twenty days after Eddy's demise, says Spiering, Stephen “Had been starved to death.”⁴⁶

And what of the actual fate of “Prince Jack” himself? “In place of the regular administrations of iodide of potassium, Eddy most probably was given daily injections of morphine. . . the dosages were steadily increased until the sleep condition became permanent,”⁴⁷ i.e., the **British Government murdered the eventual Heir to its Throne.**

“Shortly after the deaths of Eddy and his lover. . . in 1892, the official Jack the Ripper File was sealed by the Metropolitan Police. . . and designated to be hidden away for the legal 100-year period. The file's cover was marked with the profoundest verification of the murderer's identity: Closed until 1992.”⁴⁸

A Few Bizarre Aspects of the Case

*At the inquest of victim Annie Chapman, it was revealed to a horrified audience that her uterus was missing; this was the wrapped item that Eddy proudly presented to James Stephen, Spiering attests.⁴⁹

*One Ripper note to the police contained one of the victim's left kidneys', and stated, “ ‘Tother piece I fried and ate it; was very nice.”⁵⁰ Spiering claims that Stephen was, in reality, the author of **all** the Ripper letters—not Eddy.)

*“A police official had now ordered that the eyes of Annie Chapman be photographed in the belief that the retinas might contain the image of her killer. . . an assassin having been convicted in France on the strength of eyeball photography. It was not a new idea, but the police were obviously desperate to try anything.”⁵¹

*A doctor at “St. George's Hospital, Hyde Park Corner,”⁵² confessed to being Jack, refused to give his name and three weeks later his dead body was fished out of London's Thames River.

Some Dissent

Generally speaking, **Prince Jack** is an exciting, well-written book in which the author makes a strong case for his theory. As source material, he claims to have had access to a copy of Sir William Gull's notes and to have seen the police file on Jack; however, regarding the last, he says “I was not surprised to find that the contents have been gutted.”⁵³ For my part, I feel that—although such scanty evidence makes for an interesting story—it is a somewhat slender thread.

Factually, I was able to discover only one outright error. On page 34, the author gives the date of August, 1888 as the start of the ill-starred reign of German

Kaiser Wilhelm II; in actuality, it began in June, upon the death of his father, Kaiser Frederick III.

Finally, there is a question in my mind that the author fails to answer. The last known Ripper murder occurred on Feb. 13, 1891, yet Eddy survived—at least historically—until Jan. 14, 1892, almost a full year later. Why the delay on the part of the Government in murdering the Prince? Rather incongruously placed toward the end of the book is this statement: "There was no further question in his mind that Eddy's identity could be hidden. With a ruthlessness that he had never before exercised, Salisbury moved to end the whole nasty business once and for all."⁵⁴ A year's wait hardly seems to me to be expeditious, especially in this case.

Unlike author Spiering, however, I prefer not to make any flat statements pro or con the theory of the Ripper's true identity—that I leave to the reader's own judgment.

The Role of Podiatry

By HARRY F. KLINEFELTER, MD AND NEIL M. SCHEFFLER, DPM, AACFAS

Dr. Scheffler is Chief of Podiatry at Howard County General Hospital and is a member of the State Board of Podiatry Examiners. For reprints, contact him at 5205 East Dr., Arbutus, MD 21227.

Abstract

A great deal of misunderstanding and controversy exists regarding the position and role of podiatry in the medical community. A review of the history of podiatry, the education of podiatrists and the care podiatrists render patients should assist the physician in evaluating the role podiatry can assume in the comprehensive treatment of his patient.

Foot health has been a concern of mankind since at least 372 BC when the Greek Theophrastus mentioned corns. Hikesios of Smyrna (circa 60 AD) prepared a plaster for the treatment of corns. In the 4th Century, the Guild of Barber-Surgeons in Northern Europe treated feet as well as applied leeches, pulled teeth and practiced bloodletting. Medicine, dentistry and podiatry eventually evolved from these ancient roots forming their own divisions of medical practice.¹

Although, in the United States, podiatrist is the term now used for foot specialists, the term chiropodist had been in widespread use until recent years. It is unclear whether chiropody was coined from the Greek "cheirourgos" meaning surgeon, and "pedes" meaning foot, hence "surgeon of the foot," or from the Greek "cheir" for hand, since chiropodists, even in the US, treated both hands and feet.

The term was officially changed to podiatry to remove the treatment of hands from the scope of podiatry and to eliminate the confusion between the unrelated terms "chiropodist" and "chiropactor."

Due to the very short history of the profession and to the small numbers of its members, there is

some confusion about podiatry's image.

Itinerant "corn cutters" roamed the country as late as 1900 soliciting business from door-to-door. Unfortunately, the memories of these crude beginnings may still linger and affect the image of podiatry.¹ The profession has developed quite rapidly, especially if one realizes that this country's first licensing act was passed in New York in 1905, and it was only 68 years ago, in 1911, that the first American School of Chiropody was established in New York.²

There are only five podiatry colleges in the US. They are located in New York, Chicago, Philadelphia, San Francisco and Cleveland. Approximately 530 students will be graduating from podiatry school this year. There are about 8,000 podiatrists in the US, and since most of them practice in states where there are schools, there is a shortage of podiatrists in many parts of the country. The Department of Health, Education and Welfare has designated these "shortage areas" (many areas of Maryland, for example, have been so designated) and has provided incentives to graduating podiatrists to open their practices in these areas. Lack of exposure to the general medical community has kept the image of podiatry from keeping pace with the sweeping changes in the education of its members.

It has repeatedly come to the authors' attention that many physicians have little knowledge of what podiatrists can do and what their educational backgrounds are. A vivid example was reported by Richard N. Podell, MD in the *New England Journal of Medicine*:

"Millions of Americans visit a podiatrist each year. Millions more have problems with their feet. Nevertheless, many Americans and

their physicians have little idea of who the podiatrist is and what he does. The author (RP) had the following conversation with a resident in orthopedics and his attending orthopedic surgeon:

RP: What do you think of podiatrists doing surgery on the foot?

Resident: If they did, they'd be put in jail!

RP: Why?

Resident: It's illegal for a podiatrist to operate.

RP: Are you sure?

Attending: No, it's not illegal, but it should be. You wouldn't want someone with only a couple of years' education operating on your foot.

RP: You mean they have only two or three years of education after high school?

Attending: Yes.

RP: Are you sure?

Attending: Yes."¹

Contrary to this attending's impressions, applicants to podiatry school have the same undergraduate requirements as those applying to medical and dental schools. As is true of those who are accepted to medical school, most who have been accepted to podiatry school have earned at least undergraduate degrees and some have earned graduate degrees. Applicants to podiatry schools take the same entrance exam (MCAT) as do those applying to medical school.

Podiatry students attend podiatry school for four years—the first two concentrate on the basic sciences—gross anatomy, physiology, pathology, histology, biochemistry, neuroanatomy, pharmacology, etc. The same texts, and in many cases, the same instructors who teach in neighboring medical schools, are utilized.

In the second two years, podiatry

schools emphasize the clinical aspects of treating foot problems. These years include intensive study in diabetes, peripheral vascular disease, geriatrics and podopediatrics. Students treat patients in clinics, do hospital rotation and externships, assist in surgery and rotate through many services applicable to their field such as dermatology, orthopedics, radiology, pediatrics, anesthesiology, emergency room, etc.

Following graduation, with a degree of DPM (Doctor of Podiatric Medicine) specialty residency programs are available, the most common being in podiatric surgery. Continuing education is required in Maryland and many other states for renewal of licensure. This represents the awareness of the need for maintaining and increasing the professional knowledge and skills of the practicing podiatrist.²

Podiatrists are accepted members of the medical community and have direct patient responsibility and the legal right to make and act upon their own independent medical judgment. This is shared only with the medical doctor, the osteopathic physician and the dentist.³ The Joint Commission on the Accreditation of Hospital guidelines⁴ permits the granting of privileges to podiatrists. Many hospitals recognize the need for comprehensive patient care and grant surgical privileges to podiatrists, also.

In Maryland, the practice of podiatry is defined as "The diagnosis and the surgical, medical or mechanical treatment of all ailments of the human foot, except arthrodesis of two or more tarsal bones, complete tarsal osteotomy, amputation of a toe or toes and administration of an anesthetic, other than local."⁵ The podiatrist can—and does—treat such disorders as bunions, hammertoes, heel spurs, fractures, skin and nail conditions, infections, local complications of diabetes and peripheral vascular disease (e.g., ulcerations), mechanical problems of the foot, athletic injuries, pediatric foot deformities and local manifestations of the arthritides, as well as other conditions. The signs and symptoms of

many systemic diseases may first become manifest in the foot. The podiatric examination often reveals systemic disease and the patient is referred for appropriate medical treatment. Examples of these diseases are numerous. One of the authors (NS) has referred patients for treatment of previously-undiagnosed dermato-fibrosarcoma, hypertension, psoriasis, diabetes mellitus, alcoholism, arterial stenosis and occlusion, tuberous sclerosis, congestive heart failure, gonococcal arthritis, other arthritides, scleroderma and many other diseases.

Physicians may make excellent use of podiatrists. Vascular surgeons and internists have long recognized the need for prophylactic care for ischemic and diabetic feet. One of the authors (HK), whose primary interest is rheumatology, has often utilized podiatrists for the treatment of the local painful manifestations of joint disease. This care may be as simple as the fabrication of a pad or orthotic device, or the recommendation of foot gear to accommodate deformed joints. The treatment, however, may involve surgical removal of all metatarsal phalangeal joints with the insertion of plastic joint replacements coupled with tendon surgery and phalangeal arthrodesis or arthroplasty.

The podiatrist, with his scope of practice limited, finds keeping pace with all advances in treatment of foot disorders within his grasp. Other physicians who treat feet as well as the rest of the body often find that rapid changes in these many areas are difficult, if not impossible, to cover adequately. Often, the foot is neglected. Dr. Sherman Coleman, the President of the American Orthopedic Association, has stated that "...there no longer is the opportunity to remain competent in all fields of orthopedics." He also stated that he stopped doing many things because he doesn't feel qualified—either because he doesn't do enough off them to maintain skill, or because he doesn't have enough time to keep up with the writings on them or because he can't learn all the new techniques. He stated that any doctor

who performs specialized surgery only intermittently should not continue to perform such procedures. He further stated, "This is a very sensitive subject, but we can't keep it quiet. It must be discussed. People deserve the best available." Dr. Coleman also stated that he believes that "it is better to do a few things well than everything not so well."

At present, 16 hospitals in Maryland have podiatrists on staff. Privileges include the full scope of podiatric medicine including surgery. Admission to the hospital is made in conjunction with a physician member of the medical staff. The podiatrist is responsible for the foot problems of the patient during the hospital stay while the physician cares for the patient's general medical problems. This team concept has worked out very well.

In conclusion, podiatrists and physicians should realize that only through a mutual exchange of ideas and techniques, through better communication and through referrals between the professions, can patients receive the best medical care. The American Medical Association and the American Podiatry Association have realized this and the AMA has created a Board of Trustees Liaison Committee on Podiatry in order to enhance understanding between the medical and podiatric professions. The committee is composed of representatives from the AMA, APA, American Hospital Association, American College of Surgeons and American Academy of Orthopedic Surgeons. It is hoped that this idea will filter down through the State, Regional and local medical societies so that local representatives of both groups can enhance understanding of the role of podiatry in our community.

Carcinoma Arising in a Villous Adenoma in a 19-Year-Old Male with Review of the Literature

By ATEF AL-SIBAI, MD; VICTOR ALBITES, MD; KONSTANTINOS DRITSAS, MD,
FACS AND NEIL NOVIN, MD, FACS

All the above physicians are Baltimore-based. For reprint information, write Dr. Novin at South Baltimore General Hospital, 3001 S. Hanover St., Balto., MD 21230.

The case of a villous adenoma with focal malignant degeneration in a 19-year-old-black male is reported. Clinically, it presented with rectal bleeding. Subsequent resection of the lesion revealed an adenocarcinoma with invasion to a mesenteric lymph node and pericolic fat. Review of the literature establishes the previous youngest age of incidence to be 27. The occurrence of this entity in a 19-year-old black male coupled with the apparent aggressiveness of the lesion prompted us to report this unique case.

Case Presentation

A 19-year-old black male presented to the Emergency Room on May 18, 1976 for the first time with the chief complaint of rectal bleeding of one day's duration. Past history revealed that he had been having bloody stools for approximately one month prior to the acute episode necessitating the Emergency Room visit. There was no history of diarrhea, changes in bowel habits and no weight loss.

Physical examination revealed a well-developed, healthy male in no distress with stable vital signs. On rectal examination, there was a mass noted on the posterior wall of the rectum, soft, slightly irregular, approximately six-seven cm. from the anal verge. The superior edge could not be palpated by the examining finger. The hematocrit on admission was 42%, which fell over the subsequent two days to 27% and which required replacement transfusion. Proctosigmoidoscopy revealed a whitish papillary sessile lesion on the posterior rectal wall with its lower border seven cm. from the anus. It bled easily to touch and extended 11 cm. superiorly to the rectosigmoid junction. Forceps biopsy

was obtained at the time of proctosigmoidoscopy which showed fragments of villous adenoma was a small focus of frank malignant degeneration. Because of the superficiality of the biopsy, the degree of infiltration could not be determined. (See Figure 1.)

UGI Series was normal. BE: large irregular abnormality in the proximal portion of the rectum which appears to be consistent with large polyp. Colonoscopy showed no other lesion in the colon. Re-biopsy at the time of colonoscopy showed benign villous adenoma.

Due to the reluctance of the patient to accept an abdominal perineal resection, the lack of specific information regarding the degree of invasion and the age of the patient, the decision was made to do a trans anal excisional biopsy under general anesthesia. This was performed June 2, 1976, and at that time a small polyp was noted superior to the primary lesion and this was excised also, and revealed an adenomatous polyp. The pathology report from the primary lesion indicated a villous adenoma with an area of infiltrating poorly differentiated adenocarcinoma. It was further noted that the fragment of intestinal muscular wall showed tumor infiltration. (See Figure 2.)

Metastatic workup revealed a normal liver scan, brain scan and bone scan. His CEA was greater than 20 ng./ml. With the information provided by the excisional biopsy, an abdominal perineal resection was recommended, accepted by the patient and done on June 14, 1976. The pathology report on this specimen showed a resected sigmoid and anus showing moderately well-differentiated adenocarcinoma with extension to the pericolic fat and lymph nodes. A mesenteric lymph node showed poorly-differentiated adenocarcinoma replacing the normal lymphoid stroma to a large extent. (See Figure 3) Duke C2.

FIGURE 1: Fragment of villous adenoma showing a small focus of frank malignant degeneration.

FIGURE 2: Villous adenoma with poorly-differentiated adenocarcinoma infiltrated into the wall.

Following his uneventful postoperative recovery, he was discussed by our Tumor Board and it was recommended that he receive radiation therapy to the pelvis and perineum, then chemotherapy consisting of methyl-CCNU and five Fluorouracil. The patient refused radiation therapy and was started on chemotherapy. He is being followed with frequent CEA determinations, liver scans and close clinical evaluation in Tumor Clinic.

Discussion

Villous adenoma or papillary adenoma is so named because of the presence of frondlike projections. Usually, it is a poorly-demarcated, bulky, broad-based lesion. They are smooth, soft and velvety to the examining finger. Microscopically, there are numerous long villous projections with narrow stroma covered by cylindrical epithelium cells (See Figure 4.)

Villous adenoma is rarely seen under the age of 45. Age distribution reported in the literature²⁻⁵ ranges between 27-93 years of age. It has never been seen in childhood.¹ There is no predominance for either sex. In the United States, Caucasians are affected in approximately 92-95% of the cases and blacks constitute 5-8% of patients seen with this condition.³⁻⁵

The literature was reviewed and in 575 cases²⁻⁵ the most common signs and/or symptoms reported were

- 1 Rectal bleeding 46.2%
- 2 Mucoïd diarrhea 24.9%
- 3 Abdominal pain 12.7%

The severe—depletion syndrome of hypokalemia and dehydration due to severe diarrhea was reported in only 18% of patients in one series,⁴ and to only one in another series of 55 patients.² A few patients have noted changes in the bowel as well as weight-loss and unexplained anemias.

Asymptomatic patients were 20.9% of all cases reviewed. The location of the lesions in this review were in the rectosigmoid in 77.3% of which 35% were detected by the examining finger. Sigmoidoscopy detected 82.7% of the cases and barium enema was indicative of the lesion in 67.3% of the cases.

The size of the lesions ranged from 2-14 cm. and the relationship between the size of the lesion and evidence of malignancy in the particular lesion showed a rather

high correlation. In lesions less than 2 cm., malignancy was approximately 25%. In lesions ranging from 2-5 cm., malignancy was noted in 58.5% and in the largest lesions, over 5 cm. in size, malignancy was present in 80% of the cases;⁵ however, in trying to describe the overall incidence of malignancy of this lesion, one must be aware that the criteria for labeling one of these lesions as malignant in a particular study varied from cellular atypia to those requiring evidence of invasion;⁴ hence, the overall incidence of malignancy in the studies reviewed varied between 35%-58%. It should be noted that associated adenomatous polyps were reported in 25% of patients as was found in our patient.

Treatment varied from local excision via the proctoscope, colotomy with excision of the lesion, the anterior resection and abdominal perineal resection depending upon both location and the extent of invasion.^{3,4} It was noted that there was a high incidence of recurrence in locally excised lesions.³ Overall, the five-year survival rate is reported to be between 75-80%. Because of the rarity of this tumor in the young adult patient and the absence of this tumor in the pediatric population, we are presenting this report.

MEDICAL SUITES

NOW LEASING,
OCCUPANCY WINTER, 1978

Special Medical Design

Ramped Entrance ways . . . Full-service radiology and pathology laboratories . . . Oversized elevator for stretchers . . . Public rest rooms equipped for the handicapped . . . Complete pharmacy. Wet stacks strategically located throughout the building.

Special Features

Covered drive-up entrance . . . Unique energy-saving environmental system, embodying above-normal air exchanges, a variable volume air system, heat pumps, including individual thermostat controls.

Visible Location

This modern medical facility is located at the corner of Route #355 and Shady Grove Road. Fifty-five thousand cars a day go through that intersection. It is just two-minutes drive time from U.S. 270. Over 60,000 people live within four miles of this location and over 100,000 within six miles. It is within minutes of the Shady Grove Adventist Hospital.

A Medical Society's Participation in Health Planning

By ALBERT M. ANTLITZ, MD

Dr. Antlitz is Head of the Division of Cardiology at Mercy Hospital in Baltimore, President of the Baltimore City Medical Society and a Member of the Executive Committee of the Central Maryland Health Systems Agency. For reprint requests, write him at 301 St. Paul Pl., Baltimore, MD 21202.

Health planning has been part of the Maryland scene for the past 10 years, but the interest and involvement of the medical community for much of that time was sporadic, antagonistic and usually ineffectual. The revamping of the health planning structure by the National Health Planning and Resources Development Act of 1974 (PL 93-641) provided an opportunity for fresh input into the planning process which was quickly seized by the Baltimore City Medical Society (BCMS).

Maryland enacted its first health planning law in 1968 to conform with the 1966 Federal Partnership for Health Act (PL 89-749).¹ This law gave birth to the Maryland Comprehensive Health Planning Agency, as the "(a)" agency under the Federal law and authorized the formation of areawide "(b)" agencies as advisory groups. Together, these agencies were responsible for certificate of conformance reviews required for construction or modification of health care facilities and for the development of regional and statewide health plans.

The Regional Planning Council (RPC), composed of the elected officials in Baltimore City and the five surrounding counties, was established by the State in 1963 as the planning agency for the Baltimore Standard Metropolitan Statistical Area. Although not primarily concerned with health planning, it was a natural move for the RPC to become, with some modifications, the Baltimore regional health planning agency under the 1968 law. To comply with the requirement that health planning be done by a coalition of politicians, consumers and providers, the Citizens Health Council (CHC) was formed as the advisory body to the RPC in 1969.²

There was minimal input from the medical community during this time. The BCMS adopted a resolution in October, 1968 recognizing the need for health planning on a regional basis and urging the formation of a Regional Committee for Comprehensive Health Planning. Although the membership of this committee included a representative of each of the six component medical societies in the metropolitan area, the black medical society and the two medical schools in the city, little enthusiasm was generated among the medical societies and, consequently, the manner of selecting physicians to serve on the CHC was left to the planners themselves. Several physicians did serve as members of the CHC and its task forces, but they represented public health, medical schools or other interests; none represented organized medicine or provided feedback to the medical society.

Providers on the CHC were selected through a cumbersome process of delineating broad interest groups and assigning their representatives to panels. In late 1969 and early 1970, there were panels on Ambulatory and Outpatient Care Facilities, Hospitals, Environment, Extended and Nursing Care Institutions, Students in Health Professions, Financing Agents, Health Related and Allied Agencies, Health Officers, Educational Institutions, Voluntary Health Agencies, Independent Private Office Practice and Professional Associations and Licensing Bodies.³ The BCMS was asked to nominate a representative to the Professional Associations and Licensing Bodies Panel which included representatives of medicine, dentistry, nursing, medical technology, dietetics, physical therapy, sanitary engineering, social work, psychology and audiology. Each panel selected a delegate to serve on the CHC. On paper, this assured dialogue with and input from many segments of health care providers. In effect, there was little or no communication. The panels were frequently very large, consisted of diverse interest groups, and met only once or twice each year, all of which combined to negate effective interaction.

In early 1971, the BCMS became concerned with some of the pronouncements emanating from the CHC and a meeting with the Council's Executive Director was held. This resulted in the appointment of a representative to the Project Review Committee, giving the Medical Society direct involvement in the planning process for the first time.

The Project Review Committee was responsible for reviewing proposals for construction of health facilities and making recommendations to the CHC. This link with health planning was tenuous, but did provide the Society with information about the types of activities being undertaken. Although the BCMS representative submitted monthly written reports to the Board of Directors, the Society did not place a high priority on health planning and, for the next three years, was content with simply receiving the reports.

Early in 1974, parts of the CHC draft health plan were distributed and the section dealing with primary care was reviewed by the Society's Health Care Delivery Committee. It was obvious that this plan would affect private physicians as well as hospitals and nursing homes. Concern over the inability of the Society to impact on this plan was voiced at a meeting of officers and committee chairmen in September, 1974 and an ad hoc committee was formed to develop ways in which the BCMS could become more involved in health planning. Shortly thereafter, PL 93-641 was enacted.

Coinciding as it did with the aroused interest in health planning within the Society, this law gave the BCMS an opportunity to regain initiative in the planning process. A campaign to inform physicians about

the new law was begun through the Society's **Newsletter** and reports at meetings. Letters were sent encouraging the Presidents of the five counties surrounding Baltimore City—Anne Arundel, Baltimore, Carroll, Harford, and Howard—to become involved. The Board of Directors passed a motion recommending to the Governor that the Baltimore Metropolitan Area be designated as a health systems area and encouraging the inclusion of organized medicine in the governing structure of the health systems agency.

The health planning agencies also reacted to PL 93-641 quickly and the Regional Planning Council, the Citizens Health Council and Regional Medical Program each formed an ad hoc committee to study implementation of the law. The Baltimore Metropolitan Area was designated a health service area in April, 1975 and the Regional Medical Program and the Citizens Health Council ad hoc committees began meeting together to develop a plan for the formation of a health systems agency. The Regional Planning Council, however, was concerned that the law would limit its authority and was prepared to submit its own letter of intent to develop a health systems agency in the region. After much negotiation, the Regional Planning Council agreed not to submit and joined with Regional Medical Program and Citizens Health Council to develop a new agency.

In June, 1975, the first meeting of the three groups was held and the BCMS was invited to participate as a guest. The interest of the medical societies in the implementation of the law and the formation of the agency was recognized and the BCMS representative was a voting member at the July meeting of the Committee.

Word of the Committee's activities spread throughout the community and professional and community groups not represented appeared demanding membership. When a decision was made to enlarge the membership to 100, i.e. 51 consumers/49 providers, the BCMS sent letters to the county medical societies urging them to appoint representatives to attend the coming meetings and to press for membership.

The importance of joint efforts on the part of the medical societies cannot be underestimated. In the past, governmental agencies had been accustomed to dealing with local medical societies individually. This was the first time that all of the medical societies in the region united and presented an organized position. The county societies were at first leery of the larger City Society and were suspect that the BCMS was attempting to usurp their own prerogatives. Through the efforts of individual leaders within the county and City societies, and because the City insisted on equal representation for each society on the Ad Hoc Committee, the Coalition of Medical Societies was formed and held together. This unity was a major factor in the medical community's ability to successfully impact on the Ad Hoc Committee and later on the health systems agency.

At the time the Ad Hoc Committee of 100 was formed

in October, 1975, a physician from each medical society in the Metropolitan Area had been elected as a member. Task forces to develop the structure and policies of the health systems agency were appointed and medical society representatives served on those concerned with Governance and Membership, Systems Development, Certification and Review, Planning and Education. The physicians serving on different task forces shared their experiences with each other providing broader input into each group and cementing the concept of the Coalition of Medical Societies. Through these efforts, the credibility of the medical societies was established. This reaped dividends later when support was needed for the recommendation that physician members of the Central Maryland Health Systems Agency (CMHSA) Governing Body be selected by the medical societies.

The application submitted to the Department of Health, Education and Welfare called for the appointment of six physicians nominated by the medical societies in the region—one each from Baltimore City and the black medical society (the Maryland Chapter of the National Medical Association) and four from the five counties. This membership formula was accepted when conditional status was granted the CMHSA in June, 1976 and reaffirmed when full designation was received in 1978.

Effective health planning requires the cooperation and support of the medical profession. The medical societies in the Baltimore region have seven representatives on the CMHSA Governing Body and one on the Executive Committee. These physicians and others serving on subarea councils and CMHSA committees are affecting health planning decisions. Physicians and their medical societies can have a marked influence in health planning agencies if they are willing to spend the time and energy necessary to understand and actively participate in the process.

Doctors in the News

Dr. Weisman Honored

Maxwell N. Weisman, MD has been singled out by his colleagues to receive the highest award given by the Council of State and Territorial Alcoholism Authorities for his contribution to alcoholism program development at the national, state and local levels. The award was presented recently at the CSTAA annual meeting in Oklahoma City.

Dr. Weisman has been the Director of Maryland's Alcoholism Control Administration since its establishment by the State Legislature in 1968. Prior to that time, he had been the Director of Community Psychiatry in the State Department of Mental Hygiene, to which he had been appointed immediately after completing a psychiatric residency in 1962 at the University of Maryland.

Although he had a distinguished career first as a teacher of Latin and then as a Professor of Biology at the University of Puerto Rico, becoming deeply involved in the Island's social and intellectual life through his role as Director of Veteran's Education in the Puerto Rico Department of Instruction, he decided to embark on the study of medicine when he was past 40 years of age. Too old to be admitted to medical schools in the United States, he went to the Netherlands and was graduated from the University of Amsterdam Medical School in 1958.

Fluent in six languages, Dr. Weisman is Past President of the American Medical Society on Alcoholism and serves on the Faculty of many university-based schools of alcohol studies including the Rutgers University and Utah University Summer Schools in addition to Johns Hopkins University and the University of Maryland. He is known and respected as an international authority and lecturer on the medical aspects of alcohol abuse and alcoholism. While in the Netherlands, he served as an editor with

Excerpta Medica in the fields of ophthalmology, obstetrics and gynecology and general psychiatry.

Commenting on the occasion at the formal presentation, the President of CSTAA indicated that Dr. Weisman had been selected for this prestigious award after all 56 State and Territorial Alcoholism Directors had been surveyed, and in recognition of Maryland's outstanding alcoholism program.

Dr. Handelsman Receives Golden Apple Award

Jacob C. Handelsman, MD, Attending Surgeon at Sinai Hospital in Baltimore, is the latest recipient of Sinai's Golden Apple Award.

The Golden Apple is given several times each year by the Hospital Staff Association for excellence in teaching and dedication to the medical profession.

Dr. Handelsman, who was interim Co-Chairman of Surgery during most of 1977, is the ninth recipient of the award.

Other members of the Golden Apple Society are Drs. Samuel J. Abrams, Jerome P. Reichmeister, Herbert L. Yousem, Leon G. Sheer, Juan M. Juanteguy, Ernest Scher, Belur S. Bhagavan and Melvin L. Keller.

The author of innumerable professional publications, Dr. Handelsman is a member of many professional associations, including the American College of Surgeons, the Society of University Surgeons and the Baltimore Academy of Surgery, AMA, the Baltimore City Medical Society, Med-Chi and also serves on the Board of Directors of Blue Shield of Maryland. □

**PERFORATION OF UTERUS
WITH SAF-T-COIL
and
INTRALIGAMENTOUS
EXTRAUTERINE
PREGNANCY,
by H. Melvin Radman, MD**

Tenuate[®]
(diethylpropion hydrochloride NF)

Tenuate Dospan[®]
(diethylpropion hydrochloride NF) controlled-release

AVAILABLE ONLY ON PRESCRIPTION
Brief Summary

INDICATION: Tenuate and Tenuate Dospan are indicated in the management of exogenous obesity as a short-term adjunct (a few weeks) in a regimen of weight reduction based on caloric restriction. The limited usefulness of agents of this class should be measured against possible risk factors inherent in their use such as those described below.

CONTRAINDICATIONS: Advanced arteriosclerosis, hyperthyroidism, known hypersensitivity, or idiosyncrasy to the sympathomimetic amines, glaucoma. Agitated states. Patients with a history of drug abuse. During or within 14 days following the administration of monoamine oxidase inhibitors, (hypertensive crises may result).

WARNINGS: If tolerance develops, the recommended dose should not be exceeded in an attempt to increase the effect; rather, the drug should be discontinued. Tenuate may impair the ability of the patient to engage in potentially hazardous activities such as operating machinery or driving a motor vehicle; the patient should therefore be cautioned accordingly. **Drug Dependence:** Tenuate has some chemical and pharmacologic similarities to the amphetamines and other related stimulant drugs that have been extensively abused. There have been reports of subjects becoming psychologically dependent on diethylpropion. The possibility of abuse should be kept in mind when evaluating the desirability of including a drug as part of a weight reduction program. Abuse of amphetamines and related drugs may be associated with varying degrees of psychologic dependence and social dysfunction which, in the case of certain drugs, may be severe. There are reports of patients who have increased the dosage to many times that recommended. Abrupt cessation following prolonged high dosage administration results in extreme fatigue and mental depression; changes are also noted on the sleep EEG. Manifestations of chronic intoxication with anorectic drugs include severe dermatoses, marked insomnia, irritability, hyperactivity, and personality changes. The most severe manifestation of chronic intoxications is psychosis, often clinically indistinguishable from schizophrenia. *Use in Pregnancy:* Although rat and human reproductive studies have not indicated adverse effects, the use of Tenuate by women who are pregnant or may become pregnant requires that the potential benefits be weighed against the potential risks. *Use in Children:* Tenuate is not recommended for use in children under 12 years of age.

PRECAUTIONS: Caution is to be exercised in prescribing Tenuate for patients with hypertension or with symptomatic cardiovascular disease, including arrhythmias. Tenuate should not be administered to patients with severe hypertension. Insulin requirements in diabetes mellitus may be altered in association with the use of Tenuate and the concomitant dietary regimen. Tenuate may decrease the hypotensive effect of guanethidine. The least amount feasible should be prescribed or dispensed at one time in order to minimize the possibility of overdosage. Reports suggest that Tenuate may increase convulsions in some epileptics. Therefore, epileptics receiving Tenuate should be carefully monitored. Titration of dose or discontinuance of Tenuate may be necessary.

ADVERSE REACTIONS: *Cardiovascular:* Palpitation, tachycardia, elevation of blood pressure, precordial pain, arrhythmia. One published report described T-wave changes in the ECG of a healthy young male after ingestion of diethylpropion hydrochloride. *Central Nervous System:* Overstimulation, nervousness, restlessness, dizziness, jitteriness, insomnia, anxiety, euphoria, depression, dysphoria, tremor, dyskinesia, mydriasis, drowsiness, malaise, headache, rarely psychotic episodes at recommended doses. In a few epileptics an increase in convulsive episodes has been reported. *Gastrointestinal:* Dryness of the mouth, unpleasant taste, nausea, vomiting, abdominal discomfort, diarrhea, constipation, other gastrointestinal disturbances. *Allergic:* Urticaria, rash, erythema, pruritus. *Endocrine:* Impotence, changes in libido, gynecomastia, menstrual upset. *Hematopoietic System:* Bone marrow depression, agranulocytosis, leukopenia. *Miscellaneous:* A variety of miscellaneous adverse reactions has been reported by physicians. These include complaints such as dyspnea, hair loss, muscle pain, dysuria, increased sweating, and polyuria.

DOSAGE AND ADMINISTRATION: Tenuate (diethylpropion hydrochloride): One 25 mg. tablet three times daily, one hour before meals, and in mid-evening if desired to overcome night hunger. Tenuate Dospan (diethylpropion hydrochloride) controlled-release: One 75 mg. tablet daily, swallowed whole, in mid-morning. Tenuate is not recommended for use in children under 12 years of age.

OVERDOSAGE: Manifestations of acute overdosage include restlessness, tremor, hyperreflexia, rapid respiration, confusion, assaultiveness, hallucinations, panic states. Fatigue and depression usually follow the central stimulation. Cardiovascular effects include arrhythmias, hypertension or hypotension and circulatory collapse. Gastrointestinal symptoms include nausea, vomiting, diarrhea, and abdominal cramps. Overdose of pharmacologically similar compounds has resulted in fatal poisoning, usually terminating in convulsions and coma. Management of acute Tenuate intoxication is largely symptomatic and includes lavage and sedation with a barbiturate. Experience with hemodialysis or peritoneal dialysis is inadequate to permit recommendation in this regard. Intravenous phentolamine (Regitine[®]) has been suggested on pharmacologic grounds for possible acute, severe hypertension, if this complicates Tenuate overdosage.

Merrell

B-3921 (7587A)

**Whether overweight is a
complicating factor...
or just uncomplicated overweight.**

Tenuate® Dospan®^{IV} **(diethylpropion hydrochloride NF)** **75 mg. controlled-release tablets**

A useful short-term adjunct in an indicated weight loss program.

Overweight patients in certain diagnostic categories often require strict obesity control. Diethylpropion hydrochloride has been reported useful in obese patients with hypertension, symptomatic cardiovascular disease, or diabetes. While it is not suggested that Tenuate in any way reduces these complications in the overweight, it may have a useful place as a short-term adjunct in a prescribed dietary regimen. (Tenuate should not be administered to patients with severe hypertension; see additional Warnings and Precautions on the opposite page.)

In uncomplicated obesity.

Many patients, on the other hand, present with excess fat but no disease. While this condition is often termed uncomplicated obesity, complications of both a social and a psychologic nature may be distressingly real for the patients. In these cases, a short-term regimen of Tenuate can help reinforce your dietary counsel during the important early weeks of an indicated weight loss program.

Clinical effectiveness.

The anorexic effectiveness of diethylpropion hydrochloride is well documented. No less than 16 separate double-blind, placebo-controlled studies attest to its usefulness in daily practice.¹ And the unique chemistry of Tenuate provides "...anorexic potency with minimal overt central nervous system or cardiovascular stimulation."² Compared with the amphetamines, diethylpropion has minimal potential for abuse.

**Tenuate—it makes sense.
And it's responsible medicine.**

For prescribing information see opposite page

The evidence of experience

Since October 1974 when Motrin® (ibuprofen) was introduced in the United States, it has been used by more than 6,000,000 patients with rheumatoid arthritis* or osteoarthritis. Rarely has an ethical pharmaceutical product been prescribed for so many patients in so short a time. In addition, more than 450 studies presenting new data related to Motrin have been published.

The 6,000,000 patients already treated with Motrin is an objective measure of physicians' confidence in the ability of Motrin to relieve the pain and inflammation associated with rheumatoid arthritis and osteoarthritis.

So it is not surprising that in this short period Motrin has become the most frequently prescribed alternative to aspirin. Motrin relieves joint pain and inflammation as effectively as indomethacin or aspirin, but causes significantly fewer CNS and milder GI reactions. However, gastrointestinal bleeding, sometimes severe, has been associated with Motrin, aspirin, indomethacin, and other nonsteroidal antiarthritic agents.

*The safety and effectiveness of Motrin have not been established in patients with Functional Class IV rheumatoid arthritis (incapacitated, largely or wholly bedridden, or confined to wheelchair; little or no self-care).

U-6857-4

The confidence that comes from experience—
one more reason to prescribe

Motrin[®] 400 mg TABLETS

ibuprofen, Upjohn

Indications and Usage: Treatment of signs and symptoms of rheumatoid arthritis and osteoarthritis during acute flares and in long-term management. Safety and efficacy have not been established in Functional Class IV rheumatoid arthritis.

Contraindications: Individuals hypersensitive to it, or with the syndrome of nasal polyps, angioedema and bronchospastic reactivity to aspirin or other nonsteroidal anti-inflammatory agents (see WARNINGS).

Warnings: Anaphylactoid reactions have occurred in patients with aspirin hypersensitivity (see CONTRAINDICATIONS).

Peptic ulceration and gastrointestinal bleeding, sometimes severe, have been reported. Ulceration, perforation, and bleeding may end fatally. An association has not been established. Motrin should be given under close supervision to patients with a history of upper gastrointestinal tract disease, only after consulting ADVERSE REACTIONS.

In patients with active peptic ulcer and active rheumatoid arthritis, nonulcerogenic drugs, such as gold, should be tried. If Motrin must be given, the patient should be under close supervision for signs of ulcer perforation or gastrointestinal bleeding.

Precautions: Blurred and/or diminished vision, scotomata, and/or changes in color vision have been reported. If these develop, discontinue Motrin and the patient should have an ophthalmologic examination, including central visual fields.

Fluid retention and edema have been associated with Motrin; use with caution in patients with a history of cardiac decompensation.

Motrin can inhibit platelet aggregation and prolong bleeding time. Use with caution in persons with intrinsic coagulation defects and those on anticoagulant therapy.

Patients should report signs or symptoms of gastrointestinal ulceration or bleeding, blurred vision or other eye symptoms, skin rash, weight gain, or edema.

To avoid exacerbation of disease or adrenal insufficiency, patients on prolonged corticosteroid therapy should have therapy tapered slowly when Motrin is added.

Drug interactions. Aspirin used concomitantly may decrease Motrin blood levels.

Coumarin: Bleeding has been reported in patients taking Motrin and coumarin.

Pregnancy and nursing mothers: Motrin should not be taken during pregnancy or by nursing mothers.

Adverse Reactions

Incidence greater than 1%

Gastrointestinal: The most frequent type of adverse reaction occurring with Motrin (ibuprofen) is gastrointestinal (4% to 16%). This includes nausea*, epigastric pain*, heartburn*, diarrhea, abdominal distress, nausea and vomiting, indigestion, constipation, abdominal cramps or pain, fullness of the GI tract (bloating and flatulence). **Central Nervous System:** Dizziness*, headache, nervousness. **Dermatologic:** Rash* (including maculopapular type), pruritus. **Special Senses:** Tinnitus. **Metabolic:** Decreased appetite, edema, fluid retention. Fluid retention generally responds promptly to drug discontinuation (see PRECAUTIONS).

Incidence: Unmarked 1% to 3%; *3% to 9%.

Incidence less than 1 in 100

Gastrointestinal: Upper GI ulcer with bleeding and/or perforation, hemorrhage, melena. **Central Nervous System:** Depression, insomnia. **Dermatologic:** Vesiculobullous eruptions, urticaria, erythema multiforme. **Cardiovascular:** Congestive heart failure in patients with marginal cardiac function, elevated blood pressure. **Special Senses:** Amblyopia (see PRECAUTIONS). **Hematologic:** Leukopenia, decreased hemoglobin and hematocrit.

Causal relationship unknown

Gastrointestinal: Hepatitis, jaundice, abnormal liver function. **Central Nervous System:** Paresthesias, hallucinations, dream abnormalities. **Dermatologic:** Alopecia, Stevens-Johnson syndrome. **Special Senses:** Conjunctivitis, diplopia, optic neuritis. **Hematologic:** Hemolytic anemia, thrombocytopenia, granulocytopenia, bleeding episodes. **Allergic:** Fever, serum sickness, lupus erythematosus syndrome. **Endocrine:** Gynecomastia, hypoglycemia. **Cardiovascular:** Arrhythmias. **Renal:** Decreased creatinine clearance, polyuria, azotemia.

Overdosage: In cases of acute overdose, the stomach should be emptied. The drug is acidic and excreted in the urine, so alkaline diuresis may be beneficial.

Dosage and Administration: Suggested dosage is 300 or 400 mg t.i.d. or q.i.d. Do not exceed 2400 mg per day.

ALDOMET[®]
(METHYLDOPA/MSD)

TABLETS: 500 mg, 250 mg, and 125 mg

Twin Engineering Devices, to Reduce Massive Lymphedema, and Maintain the Reduction.

Massive and obstinate lymphedema of the limbs may be reduced through use of the Jobst Extremity Pumps (Intermittent Compression) (photo 1). Its controlled pneumatic massage gently removes edema fluid from congested areas.

Jobst Extremity Pumps are available in hospital, clinical, and home models (shown), the latter being available on rental. All units have controls to vary

both pressure and time cycles.

When the desired reduction is attained, it can be maintained with a *Jobst Venous Pressure Gradient*® Support. These supports are custom-made to your prescription and the patient's individual measurements (photo 2). You may prescribe exact counterpressures. "In-Patient" orders will be given special attention.

Contact your local Jobst Service Center for complete details.

Postoperative Pulmonary Insufficiency: Better Prognosis With Appropriate Therapy

By ABDALLAH ALAMEDDINE, MD

Dr. Alameddine is affiliated with the Harvard Surgical Unit, Sears Bldg., Boston City Hosp., Boston, MA 02118, where he should be contacted for reprint and other data requests.

Introduction

A retrospective analysis was made of the data on 78 patients who had lung problems as part of their very serious illnesses and treated in the intensive care unit with mechanical respiratory assistance following major surgery in a 17-month period in 1974-75. Most

of the patients reported had more than one complication in addition to their pulmonary problems (Table 4). The analysis yielded 18 patients (Group 1) who required ventilatory support for more than three days. Sixty patients (Group 2) were extubated before 72 hours. Hospital mortality rate was 56% in Group 1, where the major cause of death was non pulmonary in 90% of cases (Table 3). In Group 2, 15% of the patients died, all from non-pulmonary causes.

This paper calls attention to the problem of pulmonary complications, in particular pulmonary insufficiency, in the postoperative period, and sheds indirect light on the prognosis. Although none of the therapeutic maneuvers is original, this study emphasizes that with a specific plan of therapy—and if the patient's primary disease is recoverable—then the pulmonary complication is of little prognostic importance.

Several authors have documented

a high incidence of pulmonary complications following surgery, in particular, pulmonary insufficiency, which continues to present problems in management to both the physician and surgeon. Meticulous preoperative preparation, efficient surgical technique and intensive postoperative care are of utmost importance¹ to decrease mortality and morbidity.

Materials and Methods

The present study was conducted on 78 patients suffering from postoperative respiratory failure who were managed in the Intensive Care Unit, at Union Memorial Hospital in Baltimore, by mechanical ventilatory support. These patients came to the unit following their surgery for one reason or another, not always because of actual respiratory distress, but in some instances in the hope of avoiding it.

Some of them came from the operating room with an endotracheal tube and being supported by a ventilator, i.e., judged necessary in

Table 1: Age Distribution of 78 General Surgery Patients who had Postoperative Respiratory Support

* All Caucasians

the opinion of the operating surgeon or the anesthesiologist conducting the case; others had respiratory distress as one phase of their complex problems. However, none of these patients did have signs of respiratory failure preoperatively.

There were 44 males and 34 females. All of them underwent major surgical procedures done under general anesthesia. Open heart cases, flail chest and burn patients were excluded. For practical purposes, the diagnosis of acute respiratory failure (ARF) was made in any postoperative patient with an arterial oxygen pressure (PaO_2) of less than 60mm. of mercury; or a PaCO_2 of more than 50mm. of mercury. Standard principles of homeostatic support applied to all patients and will be briefly touched upon: preoperative assessment and therapy in high-risk patients (obese, aged and patients with COPD), which consists of functional lung study, continuous administration of moist air, deep breathing exercises, incentive spirometer continued by postural drainage with nasal oxygen, endotracheal intubation and ventilatory of positive end-expiratory pressure (PEEP) supports for pulmonary failure, hypoxia and pneumonia.

**Two cases of ileo-jejunal bypasses for morbid obesity

Bronchoscopy is repeated, as often as necessary, during treatment for tracheal toilet and evaluation of therapy. Antibiotics were given prophylactically in some cases. Sixty-three patients were on Emerson volume-cycled respirator, 12 were on the Engstrom and three on the Bennett PR-1 pressure-cycled machine.

The age distribution is shown in Table 1. The patients were divided into two groups on the basis of the length of continuous respiratory assistance: Group 1 patients required mechanical ventilatory support for more than three days; PEEP was used in half of this group with a range between 2.5 and 10 cm. of water. Fifteen had abdominal and/or thoracic surgery, two craniotomies and one patient with open reduction fracture femur. There were three females and 14 males; 67% were more than 60 years of age. Ages ranged between 25 and 83 years. Group 2 patients were extubated before 72 hours. There were 31 females and 29 males. Patients over 60 years of age composed 65% with a range between 25 and 93 years. Six craniotomies were included in the group. The average period of treatment on respirator was 24 hours. The fraction oxygen in inspired gas (FIO_2) and minute volume (MV) were adjusted, after the initial setting, according to the blood gases. Wright respirometer was used for monitoring the tidal volume (TV) and minute ventilation. The Inhalation Therapy Department of the Union Memorial Hospital checked ventilators daily. (See Table 1).

Results

1. Clinical features: Of the entire series, 59 patients survived and 19 patients (25%) died, but only one (1.2%) died primarily of pulmonary insufficiency. The antecedent surgical incisions that precipitated ARF and pleuropulmonary complications were abdominal in 54 patients (70%), craniotomies in nine, thoracic in six, cervical spine in three; neck, thoracoabdominal and extremity operations in two patients each (Table 2). In Group 1 patients, the average PaO_2 , PaCO_2 , postoperatively and before the ventilatory support, were 46 and 28 mm.

Hg. respectively, with respiratory rate and radial pulse of 28 and 120 per minute.

2. Factors in connection with postoperative pulmonary complications: No control study was undertaken in conjunction with those two groups; overall, men were more prone than women; the incidence of complications increased with age, the highest being in patients aged over 60 years. Taking the series as a whole, the type of incision (abdominal), blood loss (500 cc.), obesity and duration of the operation (two hours) did, indeed, affect the incidence of complications.

3. Complication and survivals: The hospital death rate in Group 2 was 15%, all from "non"-pulmonary causes (Tables 3 and 4).

In Group 1, the major cause of death was non-pulmonary in 90% of the cases. Nine patients had tracheostomy performed for better respiratory care or for prevention of laryngotracheal complications. Mono or polymicrobial with a mixed flora of *Klebsiella*, *Pseudomonas* and *enterobacter*, were the bacteria most frequently encountered on sputum and/or tracheal stoma cultures.

Discussion

Following surgery, pulmonary complications continue to be a major cause of morbidity and death.² Complications may be expected as low as 3% of all operations,³ though the incidence of "miliary" atelectasis is much higher than this figure. Thirteen percent of postoperative deaths are due to pulmonary complications. In one series, the problem of ARF arose in 2.4% of all major operations.⁴ The survival rate in patients over 50 years of age was 54%.⁵

Chronic bronchitis, heavy smoking, old age, severe obesity, premedications, general anesthesia, proximity of the operative field to the diaphragm, prolonged operation, postoperative pain and sedatives, dressings and binders, immobility and over-hydration all interfere with the breathing pattern, predispose to the "restriction" of the ventilation and increase the incidence of atelectasis.⁶⁻¹⁰ Management of these patients starts before the sur-

gical procedure. A special "program" must be followed. The latter will be discussed briefly; it consists of the following:

1. Preoperative assessment of all high-risk patients: The history, physical examination, chest X-rays, ECG, blood gases and pulmonary function tests provide the best picture of a patient's pulmonary status.^{1,11-12} There are more sophisticated studies assessing closing volumes of the lung for early detection of small airway disease.¹³⁻¹⁴ The use of IPPB and prophylactic antibiotics in managing pulmonary problems are controversial.¹⁵⁻¹⁷ Short-term abstinence (three days) from smoking and incentive spirometer play their major roles in the preoperative preparation.¹⁸⁻¹⁹

2. At operation: Periodic over-inflation of the lung and avoid denitrogenation to prevent alveolar collapse.²⁰

3. Postoperatively: The importance of coughing, deep breathing chest physiotherapy and postural drainage, early ambulation and sitting position,²¹⁻²² avoidance of narcotics, tracheal aspiration and bronchoscopy when indicated cannot be over emphasized.²³ Because of the paucity of signs and symptoms, blood gases analyses and chest X-rays are required as means of prediction of pulmonary complications and follow-up. Ventilators are indicated whenever the patient is unable to maintain adequate ventilation on his/her own. We do believe, like many others,²⁴ that for prolonged use (more than 24 hours), a volume-limited respirator is superior to a pressure-limited device in several respects (better oxygenation and effective compliance). Oxygen concentration greater than 50% should be used under rare circumstances²⁵ because of its presumed deleterious effects on the lung.

If the PaO_2 is less than 50-60 mm. Hg. on 50%-inspired oxygen, then it is probably preferable to introduce PEEP,²⁶ needless to mention that secretions must be removed before starting it.²⁷ D.G. Ashbaugh, et al, have mentioned the continuous positive-pressure breathing (CPPB) in ARDS.²⁸ High-volume, low-pressure cuffs should be

used in an effort to decrease the incidence of tracheal injury and aspiration pneumonia.²⁹ There is currently good data in the medical-surgical literature on the criteria for weaning patients from respirators.

These include knowledge of pulmonary gas exchange with arterial blood gases obtained on air and oxygen breathing with calculation of alveolar-arterial differences for oxygen. Also included are measurements of mechanics including tidal volume, respiratory rate, inspiratory force and dynamic compliance,^{5,9} etc. A new approach to weaning, "intermittent mandatory ventilation" (IMV), has recently been described.³⁰

Summary

Postoperative pulmonary insufficiency taxes the morbidity and mortality of many operative procedures. It is of major clinical importance. In a series of 78 consecutive patients presenting ARF at one time of their postoperative hospital course, the overall mortality was 25%, but 1.2% died primarily of pulmonary insufficiency. Many conclusions can be drawn from our findings: the recent advances in anesthesia, a better understanding of the use of fluids and electrolytes—both during and after surgery—and careful mechanical ventilation could be cited as reasons for the lower incidence in our study. Also, this small series serves to emphasize that early recognition of pulmonary complications, the pre- and postoperative aggressive management and judicious and "prophylactic" utilization of respirators will aid in reduction of mortality in these critically-ill patients.

Low-Dose Heparin Preoperatively for Prophylaxis Against Postoperative Thromboembolism

By OTTO C. BRANTIGAN, MD

Dr. Brantigan is affiliated with the Surgical Department of St. Joseph Hospital, Towson, MD 21204, where he can be contacted for reprint and other data.

Method

The study covers a three-year period from Nov. 22, 1972-Nov. 21, 1975. All patients were private patients of one surgeon who managed the patient throughout the hospital course and during the follow-up period. All patients 40 years of age or older who had an elective major surgical operation under general anesthesia were given low-dose heparin 18-24 hours before surgery and low-dose heparin was continued for 48 hours after surgery.

All control patients were 40 years of age or older and all had a major operation under general anesthesia. The controls were two groups.

One group of controls consisted of patients operated upon by other surgeons at St. Joseph Hospital who did not use prophylactic heparin. The operating room nurses selected and matched the prophylactic low-dose heparin patients with patients by other surgeons not treated with heparin, age for age, sex for sex, duration of operation and, when possible, type of operation, and, finally, patients operated upon within one week in order to rule out seasonal variations.

The second control group of patients was consecutive patients 40 years of age or older who, during a three-year period preceding the study, had major surgery by

the surgeon carrying out the study. In the study patients and in the control patients, orthopedic and neurosurgical patients were excluded; patients requiring emergency operation were excluded, also, since there was insufficient time to carry out preoperative heparin therapy.

Sodium heparin, 2,000 units, was given subcutaneously at 4 and 10 PM on the day prior to operation and on the day of operation at 6 AM if the operation was scheduled before noon, and at 8 AM if scheduled after noon. Postoperatively, heparin was given every eight hours for six doses beginning at 10 PM the day of operation. The heparin-treated patients in the study and the control untreated patients of the surgeon doing the study were followed after leaving the hospital for at least three months. The untreated control patients selected by the operating room nurse were observed only to the date of discharge from the hospital, and this could be a period as short as four or five days.

The total number of patient admissions, the total number of operations, with the total number of complications of phlebitis, phlebotrombosis, thrombophlebitis, pulmonary embolism and pulmonary infarction at St. Joseph Hospital was obtained for the corresponding six-year period covered by the study. These admissions include

●
Postoperative thrombophlebitis—with its sequelae of the possible pulmonary embolism, with its ever-present threat of death and the threat of a lasting, chronically-swollen leg—continues to be an important, though clinically an infrequent, complication of major surgery.

The frequency of phlebitis, phlebotrombosis, thrombophlebitis, pulmonary embolism and pulmonary infarction is difficult to state in a simple numerical manner. There are many ways of reporting these conditions, making comparisons worthless.

MacLean, in 1916, isolated a substance named Heparin by Howell and Holt in 1918. Mason, in 1924, reported use of heparin in the prevention of experimental thrombosis and embolism.¹

Sharnoff² in 1966 began the preoperative prophylactic use of heparin to avoid postoperative thrombophlebitis. After a report by Boyd,³ followed by a long and far-reaching discussion of the effects of low-dose heparin given at the American Association for Thoracic Surgery at the annual meeting in 1972, a program of prophylactic, preoperative, low-dose heparin was started at the St. Joseph Hospital.

all ages, and all diseases, regardless of the service in the hospital and those with and without operation (Table 1).

Results

The compiled results are shown in Table 2. There were, in the three-year period of the study, 333 patients treated with low-dose heparin who were over 40 years of age and who had a major operation under general anesthesia. None were orthopedic or neurosurgical patients. Of the 333 low-dose, heparin-treated patients, three had a thromboembolic complication. One was a 53-year-old woman who had a repair of a hiatal

hernia, repair of gastroesophageal junction, selective gastric vagotomy, antral resection of the stomach and an appendectomy. She developed atelectasis of the lung, followed by pneumonitis and fever. She developed thrombophlebitis of the right leg 17 days after surgery—in fact, 15 days after the last treatment with low-dose heparin; she recovered.

There was a 44-year-old male who had a simple cholecystectomy. He developed phlegmasia cerulea dolens on the seventh day after surgery. He recovered. The third patient was a 57-year-old, very obese man. He was admitted as an emergency with left lower qua-

drant pain. There was a differential diagnosis of acute sigmoid diverticulitis and perforating large abdominal aortic aneurysm. He was kept in bed for observation and then prepared for abdominal aneurysmal surgery, which was accomplished six days after admission with ease and with the use of two units of whole blood. (He was operated upon the last day of the study.) On the fifth postoperative day, he died (five days after the study was completed.) An autopsy revealed a massive pulmonary embolism and diverticulitis of the sigmoid. There were no complications as a result of the use of low-dose heparin.

1975			99	1	99	1
Totals	323	9 (2.8 per 100)	333	3 (.9 per 100)	333	10 (3.0 per 100)

All patients 40 years of age or older had major surgical operation under general anesthesia. None were orthopedic or neurosurgical.

There were no patients with a bleeding tendency. (It actually seemed to eliminate the rare patient who exhibits a bleeding tendency at the time of operation.)

In the control group operated upon over a three-year period previous to the study, there were 323 patients. In this group, there were nine patients with thrombophlebitis and no patient with pulmonary embolism. In the nurse-selected control group of patients, there were 333 patients. In this group, there were 10 patients with thrombophlebitis, and no patient had pulmonary embolism.

Discussion

It has been shown that minute amounts of heparin will increase by 50 or more times the effectiveness of the activated factor X inhibitor in blood.⁴⁻⁶ It is this fact that makes low-dose heparin effective.

The 2,000-unit sodium heparin dose used three times prior to surgery and six times after surgery was selected after listening to the comprehensive discussion of the use of low-dose heparin at the 1972 annual meeting of the American Association for Thoracic Surgery.³ Reports in the literature since the beginning of the present study indicate the use of a larger dose of heparin.⁷ In this series with prophylactic heparin, there was no patient with a bleeding problem during or after surgery. There was no patient with a hematoma. It seems as though the low-dose heparin eliminated the rarely-encountered patient who has a bleeding tendency at the time of operation. This conclusion is reasonable when the report of Boyd and the discussion of his report is considered.

From what is generally believed about thrombophlebitis, it seems that the first patient really should not be counted in the series, since one cannot expect prophylaxis against thrombophlebitis 15 days after low-dose heparin was discontinued. The last patient, unfortunately, was kept in bed six days prior to surgery, and it can be believed difficulty with blood clotting began before prophylactic low-

dose heparin was administered. Low-dose heparin cannot be expected to be effective once the process of blood-clot formation has already begun. If these two patients are eliminated from the study, then the rate of thrombophlebitis after the use of low-dose heparin is .3 per 100, instead of .9 per 100.

The study strengthens the common belief that obesity and bed rest prior to surgery are potent factors in development of thrombophlebitis. The development of complications after surgery, especially febrile complications, should be considered an important factor in the development of thrombophlebitis. It may be worthwhile to prescribe low-dose heparin if the patient is given bed

rest preoperatively, or if a patient has fever after operation.

The incidence of the complication of thrombophlebitis and pulmonary embolism is difficult to assess by study of the literature. There are many different methods of reporting.⁸⁻⁹ The incidence of clinical thromboembolism is, therefore, compared with the incidence found in all patients admitted to St. Joseph Hospital (Tables 1 and 3) during the time of the control period and the study period.

The incidence given by radioisotope¹⁰ study gives the astounding figures of about 25 per 100 (Table 3). This seems incredible and incorrect, unless the incidence of venous thrombosis found at necropsy is considered which ranges from 27-60 per 100 (Table

Table 4: Incidence of Venous Thrombosis Determined by Necropsy

Name	Year	Cases	Thrombosis of Calf Veins	
Rossle	1937	324	88	27.1%
Neuman	1938	165	100	60.0%

Raeburn	1951	130	35	26.9%
Totals		1840	765	41.5%

Modified from N.M. Gibbs¹¹

Table 3: Incidence of Phlebitis, Thrombophlebitis and/or Pulmonary Embolism

Source of Material	Number of Patients	Number per 100 Patients
Clinical method of determination Six-Year Total Admissions, St. Joseph Hospital	89,897	1.3
Clinical method of determination Previous Three-Year Surgical Controls	323	2.8
Clinical method of determination Nurse Selected Surgical Controls	333	3.
Clinical method of determination Prophylactic Low-Dose Heparin	333	.9 (.3)
Nuclear isotope scan determination Kakkar 1975 ¹⁰	667	24.6
Necrosy method of determination N.M. Gibbs 1957 ¹¹	1840	41.5

4).¹¹ In the necropsy study, it is easy to believe the findings are a late stage because death occurred; however, the isotope and necropsy incidence cannot be disregarded. The results of necropsy and isotope study reflect the ability of laboratory studies to detect blood clotting when it cannot be found clinically by physical findings in the living patient who has no symptoms. It seems reasonable that more clinical study is needed to further elucidate the disease. Perhaps in this way those patients who are not spared from the postoperative complication of thrombophlebitis can be saved from pulmonary embolism and/or death by early treatment with full heparin dosage.

Summary

The results of the use of prophylactic low-dose heparin in 333 patients 40 years of age or older who had a major operation under general anesthesia have been given. The incidence of phlebitis, phlebotrombosis, thrombophlebitis or pulmonary embolism was .3 per 100 patients. In 653 control pa-

tients, the incidence of phlebitis, phlebotrombosis, thrombophlebitis and pulmonary embolism was 2.9 per 100 patients.

Upward mobility.

No other mobile phone measures up to Harris' new Alpha 40.

Because Alpha 40 takes the mobile phone to a new level of sophistication.

It's the most advanced, easiest-to-use mobile phone available.

If you now have a mobile phone, you'll want to upgrade to Alpha 40. It's compatible with most standard transceivers in use today.

If you're planning for your first mobile phone, you won't want to settle for anything less.

■ Alpha 40 has all calling and pro-

gramming controls in the handset for simple one-hand operation. ■ Its

Speed Dialing feature stores up to ten frequently used numbers for quick recall.

■ Dual Microprocessing makes it easy to program in roaming channels.

■ Call Queuing feature will automatically seize the first free channel when all channels are busy.

And Alpha 40 gives you more extras: Electronic Lock, On-Hook Dialing, Last Number Recall Capability, optional Theft Alarm. And more.

Step up to Alpha 40. It offers more convenience, more abilities and more extras than any other mobile phone on the market.

The Harris Alpha 40. It's the mobile phone for people who call for only the very best.

The Clinical Significance of the Hepatitis B Surface Antigen

By RICHARD E. SAMPLINER, MD

Dr. Sampliner is Associate Professor of Medicine in the Gastroenterology Division of the Department of Medicine of the University of Maryland School of Medicine at the Veterans Administration Hospital in Baltimore, MD, where he can be contacted for reprint and other data.

The Australia Antigen was discovered by Blumberg in 1964¹ and related to clinical hepatitis in 1967. The recognition of this antigen has led to many new and exciting advances in our understanding of liver disease and its transmission. Because the Hepatitis B virus has never been grown in tissue culture, the antigen has served as a marker of the virus and the key to recent developments. Over the years, this antigen had been called the Australia Antigen, the Hepatitis Associated Antigen and, currently, the Hepatitis B Surface Antigen (HBsAg). However named, the antigen remains the only marker of the hepatitis B virus that is routinely available in the clinical setting.

The HBsAg is only one of the immunologically-recognizable products of the Hepatitis B virus. The others are the core antigen and the "e" antigen. Both the surface and core antigens can be found in the liver cell. The host hepatocyte produces HBsAg under the direction of the genome. Great excess of HBsAg is manufactured and circulates in the serum, where it can be detected by current radioimmunoassay techniques. The Hepatitis B virus also produces the enzyme DNA polymerase.

A major clinical significance of HBsAg is as a marker of liver disease. The spectrum of liver disease includes acute Hepatitis B, chronic active hepatitis and primary hepatocellular carcinoma. Acute Hepatitis B or serum hepatitis can be diagnosed when HBsAg is present in the serum. This long incubation hepatitis is now recognized to be transmitted nonparenterally as well as parenterally and occurs primarily in adults. Hepatitis B accounts for at least half of sporadic adult acute viral hepatitis. HBsAg is almost always detectable at some point in the course of Hepatitis B. It can be detected during the incubation phase for as long as one month prior to the onset of symptoms and usually disappears from the serum with resolution of the clinical illness. Hepatitis B contrasts with Hepatitis A, "infectious hepatitis," which has a shorter incubation period, is transmitted by the fecal-oral route and occurs commonly in children.

HBsAg is present in as many as one-third of patients with chronic active hepatitis. The liver disease is thought to be an immunologic reaction to the Hepatitis B viral infection. The availability of testing for HBsAg has led to the documentation of the progress of acute viral hepatitis to chronic liver disease and cirrhosis in prospective studies of patients with persistent anti-hepatitis B surface antibody. A one-to-five-year follow-up of more than

400 patients hospitalized with acute icteric Hepatitis B revealed that 10% had HBsAg in their serum persistently and developed chronic hepatitis, while three percent developed specifically chronic active hepatitis.²

HBsAg is dramatically associated with primary hepatocellular carcinoma in Africa and Southeast Asia. Although a less common finding in the United States, evidence of Hepatitis B infection can be found in 40% of patients with primary hepatocellular carcinoma.³ In addition, a small number of chronic carriers of HBsAg with liver disease have been documented to develop primary liver cancer. The key unanswered question is whether chronic carriers without underlying liver disease will develop an increased frequency of this cancer over their lifetimes.

All patients with HBsAg do not have liver disease. Apparently well individuals found by chance to have HBsAg are usually chronic carriers. By definition, a chronic carrier is an individual who has circulating HBsAg for at least six months. Although there is evidence of a genetic predisposition for the carrier state, it is not clear why some individuals remain chronic carriers and are unable to clear the virus. The frequency estimates of chronic carriers has a marked geographic variation from less than one percent in the US to 6-10% in the sub-Saharan region of Africa and Southeast Asia.⁴ Although most chronic carriers are free of liver disease, 10% of apparently healthy carriers have chronic active hepatitis and/or cirrhosis by liver biopsy. This frequency of significant liver disease in chronic carriers of HBsAg has been confirmed in the Baltimore area.⁵ Why some chronic carriers respond to the HBsAg with liver disease and others do not is unclear.

The detection of HBsAg in the serum of a patient implies infection of the liver by the Hepatitis B virus. The clinician must then determine if the viral infection has resulted in a disease state in the host. Liver enzymes need to be performed and, if elevated, repeated. If the liver enzymes are markedly elevated and the clinical picture is unclear, liver biopsy is indicated. The patient with normal enzymes should have the chronic carrier state documented by repeat HBsAg testing in six months. Persistently abnormal enzymes and persistent HBsAg for six months indicate the need for liver biopsy to exclude chronic active hepatitis.

Another important clinical implication of HBsAg is infectivity. Patients with HBsAg are a potential source of infection to the medical and general community. HBsAg has been detected in blood, bile, stool, urine, tears saliva, semen, milk and vaginal, peritoneal and pleural fluids. All of these possible modes of infection have not been proven and do not hold the same risk of transmission. Blood is clearly an important route—

at least 50% of recipients of HBsAg positive transfused blood will develop clinical hepatitis. About six percent of individuals stuck by a needle known to be contaminated by HBsAg positive blood develop hepatitis.⁶ The danger of blood exposure holds for any percutaneous manipulation—sharing of needles for drug administration, tattooing, acupuncture, barber and manicurist instruments, shared razor blades, the neurologic needle. The risk of transmission is related to the size of the inoculum.

Although the saliva of patients with acute hepatitis and of chronic carriers of HBsAg has been demonstrated to contain HBsAg,⁷ transmission by saliva has not been documented. In animal studies, transmission of Hepatitis B virus has been shown only with subcutaneous inoculation, not with lesser exposures. The role of sexual intercourse in transmission of Hepatitis B is highlighted by the high frequency of symptomatic hepatitis in the spouses of patients with acute Hepatitis B. The frequency of hepatitis B serologic markers in a homosexual population relates to large numbers of sexual partners and the predominance of anal intercourse;⁸ however, the role of vaginal intercourse in the transmission of hepatitis has not been ascertained.

Because not all individuals with HBsAg seem to transmit Hepatitis B, the identification of markers of infectivity has been an active area of investigation. The "e" antigen, DNA polymerase and Dane particle—the complete virion—have all been related to infectivity. The "e" antigen is only found in the presence of HBsAg and identifies an individual more likely to transmit Hepatitis B. This marker is not the final answer, however, for everyone with "e" antigen does not transmit hepatitis and individuals without "e" antigen can transmit the disease.⁹

Given the existence of chronic carriers and our inability to precisely define the route of transmission or the risk of transmission by a specific person, we are left to find measures to prevent the spread of Hepatitis B. Currently, there is no way to eliminate the circulating HBsAg from an individual's serum. A small percent of chronic carriers spontaneously clear HBsAg, but we cannot rely on this fortunate event. To a large extent, the prevention of the spread of Hepatitis B rests with increased personal and environmental hygiene by both infected and exposed individuals. Care in the handling of blood and all biologic materials and appropriate sterilization of instruments are essential. If a definite parenteral exposure to Hepatitis B occurs, then prophylaxis with hepatitis B immune globulin—a preparation with a high titer of antibody to HBsAg—is necessary.¹⁰ Individuals such as household contacts with nonparenteral, yet intimate exposure to patients with acute hepatitis B should receive standard immune serum globulin. A Hepatitis B vaccine now ready for trial in humans offers hope for the future prevention of Hepatitis B transmission.

Over the past decade, the clinical significance of HBsAg has been elucidated. As a marker of the Hepatitis B virus, HBsAg signifies the possibility of both liver disease and transmission of Hepatitis B.

Torrey Brown Named Director of Outpatient Services at Hopkins; Reelected to House of Delegates

Dr. Torrey C. Brown has been named Director of Outpatient Services and the Office of Health Care Programs and Assistant Dean for Clinical Programs at The Johns Hopkins Medical Institutions in Baltimore. In his new capacity, Dr. Brown will be responsible for the management of all Johns Hopkins Hospital outpatient services and will coordinate the School of Medicine's clinical service programs. The announcement was made by Dr. Robert M. Heyssel, Executive Vice President and Director of the Johns Hopkins Hospital.

Dr. Brown, who is also Associate Professor of Medicine and Assistant Professor of Health Services Administration, played a central role in developing and managing several Hopkins community health programs. Among them are the Johns Hopkins Drug Abuse Center, the Johns Hopkins Alcoholism Programs, the University Health Services and the Broadway-Orleans Health Clinic.

"I look forward to challenging and exciting times ahead, as the role of ambulatory services in serving the public's medical needs continues to grow," Dr. Brown says. "With several thousands of our East Baltimore neighbors looking to Hopkins as their family doctor, we have a particular responsibility to explore innovations in outpa-

tient care, while continuing to improve existing programs.

"An immediate concern is the planning of an Adult Comprehensive Care Unit similar to that already successfully providing care on a regular basis to children. At present, 30% of the patients seen in our emergency room actually belong in an outpatient clinic. We believe very strongly they should not be seen on an episodic, one-shot basis, even in a clinic. Instead, we want to provide a place where whole families or households can receive continuous, more effective care."

Dr. Brown has been associated with Hopkins for most of his medical career since graduating from the School of Medicine in 1961. Appointed in 1966 as Director of the Hospital's emergency services, Dr. Brown helped to start a system which relieved the emergency room of some non-emergency cases and evolved into the Hospital's Primary Care Center, which has been under his direction since 1976.

As Associate Director and then Director of the Johns Hopkins Drug Abuse Center from 1970-73, Dr. Brown was responsible for greatly expanding the services available to the community at the Center. In addition, he was instrumental in gaining community acceptance and, therefore, greatly increased the patient population. Since 1969, he has served as Director of the Johns Hopkins Hospital Alcoholism Programs.

Under Dr. Brown's leadership, the University Health Services,

DR. BROWN

(Photo by Paul F. Schlining, Jr.)

which provide medical care benefits and programs to Hopkins students, faculty and staff, made several advances. Nurse practitioners and nurse midwives began to offer care, and an unwieldy array of benefit and insurance programs was greatly streamlined. He was instrumental in planning and operating the Broadway-Orleans Health Clinic, a major outreach effort into the East Baltimore community.

Since 1974, Dr. Brown has been a member of the Maryland State Legislature, serving first as Delegate from Baltimore's Second District and currently from the 39th District (to which seat he has just been reelected.) He has served on numerous statewide committees dealing with health problems, and was interviewed in the *Journal* in January, 1977.

Dr. Brown, 41, was born in Chicago, and received his undergraduate degree in 1957 from Wheaton College in Illinois. He served his internship and residency at Hopkins, and was given a faculty appointment at the School of Medicine in 1966. He and his wife, Donnajeane, have two sons, Therron and Rafe. □

Dyazide[®]

Each capsule contains 50 mg. of Dyrenium[®] (brand of triamterene) and 25 mg. of hydrochlorothiazide.

Makes Sense in Hypertension*

Before prescribing, see complete prescribing information in SK&F Co. literature or PDR. A brief summary follows:

*** Warning**

This drug is not indicated for initial therapy of edema or hypertension. Edema or hypertension requires therapy titrated to the individual. If this combination represents the dosage so determined, its use may be more convenient in patient management. Treatment of hypertension and edema is not static, but must be reevaluated as conditions in each patient warrant.

Contraindications: Further use in anuria, progressive renal or hepatic dysfunction, hyperkalemia. Pre-existing elevated serum potassium. Hypersensitivity to either component or other sulfonamide-derived drugs.

Warnings: Do not use potassium supplements, dietary or otherwise, unless hypokalemia develops or dietary intake of potassium is markedly impaired. If supplementary potassium is needed, potassium tablets should not be used. Hyperkalemia can occur, and has been associated with cardiac irregularities. It is more likely in the severely ill, with urine volume less than one liter/day, the elderly and diabetics with suspected or confirmed renal insufficiency. Periodically, serum K⁺ levels should be determined. If hyperkalemia develops, substitute a thiazide alone, restrict K⁺ intake. **Associated widened QRS complex or arrhythmia requires prompt additional therapy.** Thiazides cross the placental barrier and appear in cord blood. Use in pregnancy requires weighing anticipated benefits against possible hazards, including fetal or neonatal jaundice, thrombocytopenia, other adverse reactions seen in adults. Thiazides appear and triamterene may appear in breast milk. If their use is essential, the patient should stop nursing. Adequate information on use in children is not available.

Precautions: Do periodic serum electrolyte determinations (particularly important in patients vomiting excessively or receiving parenteral fluids). Periodic BUN and serum creatinine determinations should be made, especially in the elderly, diabetics or those with suspected or confirmed renal insufficiency. Watch for signs of impending coma in severe liver disease. If spiro-lactone is used concomitantly, determine serum K⁺ frequently; both can cause K⁺ retention and elevated serum K⁺. Two deaths have been reported with such concomitant therapy (in one, recommended dosage was exceeded, in the other serum electrolytes were not properly monitored). Observe regularly for possible blood dyscrasias, liver damage, other idiosyncratic reactions. Blood dyscrasias have been reported in patients receiving triamterene, and leukopenia, thrombocytopenia, agranulocytosis, and aplastic anemia have been reported with thiazides. Triamterene is a weak folic acid antagonist. Do periodic blood studies in cirrhotics with splenomegaly. Antihypertensive effect may be enhanced in post-sympathectomy patients. Use cautiously in surgical patients. The following may occur: transient elevated BUN or creatinine or both, hyperglycemia and glycosuria (diabetic insulin requirements may be altered), hyperuricemia and gout, digitalis intoxication (in hypokalemia), decreasing alkali reserve with possible metabolic acidosis. 'Dyazide' interferes with fluorescent measurement of quinidine.

Adverse Reactions: Muscle cramps, weakness, dizziness, headache, dry mouth; anaphylaxis, rash, urticaria, photosensitivity, purpura, other dermatological conditions; nausea and vomiting, diarrhea, constipation, other gastrointestinal disturbances. Necrotizing vasculitis, paresthesias, icterus, pancreatitis, xanthopsia and, rarely, allergic pneumonitis have occurred with thiazides alone.

Supplied: Bottles of 100 and 1000 capsules; Single Unit Packages of 100 (intended for institutional use only).

**When painful spasm
is the presenting
symptom...**

... in functional G.I. disorders*

Bentyl[®]

(dicyclomine hydrochloride USP)

10 mg. capsules, 20 mg. tablets,
10 mg./5 ml. syrup, 10 mg./ml. injection

helps control abnormal motor activity
with minimal anticholinergic side effects[†]

Demonstrated smooth muscle relaxant activity.

In this double-blind study, twenty patients having G.I. series and exhibiting spasm were randomly selected to receive either 2 cc. of Bentyl or sodium chloride intramuscularly. Ten minutes after the injection another radiograph was taken . . .

. . . Bentyl produced definite relaxation in 8 of 10 patients. The sodium chloride produced relaxation in only 3 of 10. No side effects occurred in either group of patients.

Pylorospasm has almost totally blocked passage of barium meal.

Barium meal beginning to pass 10 minutes after intramuscular injection of 20 mg. Bentyl.

"The correlation of spasm relief and drug given was excellent."

*This drug has been classified "probably" effective in treating certain functional G.I. disorders.

†See Warnings, Precautions and Adverse Reactions.

See following page for prescribing information.

Merrell

Bentyl® (dicyclomine hydrochloride USP)

Capsules, Tablets, Syrup, Injection
AVAILABLE ONLY ON PRESCRIPTION.

Brief Summary

INDICATIONS

For use as adjunctive therapy in the treatment of peptic ulcer. IT SHOULD BE NOTED AT THIS POINT IN TIME THAT THERE IS A LACK OF CONCURRENCE AS TO THE VALUE OF ANTICHLINERGICS/ANTISPASMODICS IN THE TREATMENT OF GASTRIC ULCER. IT HAS NOT BEEN SHOWN CONCLUSIVELY WHETHER ANTICHLINERGIC/ANTISPASMODIC DRUGS AID IN THE HEALING OF A PEPTIC ULCER, DECREASE THE RATE OF RECURRENCES, OR PREVENT COMPLICATION.

Based on a review of this drug by the National Academy of Sciences—National Research Council and/or other information, FDA has classified the following indications as "probably" effective:

May also be useful in the irritable bowel syndrome (irritable colon, spastic colon, mucous colitis, acute enterocolitis, and functional gastrointestinal disorders); and in neurogenic bowel disturbances (including the splenic flexure syndrome and neurogenic colon).

THESE FUNCTIONAL DISORDERS ARE OFTEN RELIEVED BY VARYING COMBINATIONS OF SEDATIVE, REASSURANCE, PHYSICIAN INTEREST, AMELIORATION OF ENVIRONMENTAL FACTORS.

For use in the treatment of infant colic (syrup).

Final classification of the less-than-effective indications requires further investigation.

CONTRAINDICATIONS: Obstructive uropathy (for example, bladder neck obstruction due to prostatic hypertrophy); obstructive disease of the gastrointestinal tract (as in achalasia, pyloroduodenal stenosis); paralytic ileus, intestinal atony of the elderly or debilitated patient; unstable cardiovascular status in acute hemorrhage; severe ulcerative colitis; toxic megacolon complicating ulcerative colitis; myasthenia gravis. **WARNINGS:** In the presence of a high environmental temperature, heat prostration can occur with drug use (fever and heat stroke due to decreased sweating). Diarrhea may be an early symptom of incomplete intestinal obstruction, especially in patients with ileostomy or colostomy. In this instance treatment with this drug would be inappropriate and possibly harmful. Bentyl may produce drowsiness or blurred vision. In this event, the patient should be warned not to engage in activities requiring mental alertness such as operating a motor vehicle or other machinery or perform hazardous work while taking this drug. **PRECAUTIONS:** Although studies have failed to demonstrate adverse effects of dicyclomine hydrochloride in glaucoma or in patients with prostatic hypertrophy, it should be prescribed with caution in patients known to have or suspected of having glaucoma or prostatic hypertrophy. Use with caution in patients with: autonomic neuropathy; hepatic or renal disease; ulcerative colitis—Large doses may suppress intestinal motility to the point of producing a paralytic ileus and the use of this drug may precipitate or aggravate the serious complication of toxic megacolon; hyperthyroidism; coronary heart disease; congestive heart failure; cardiac arrhythmias; and hypertension; hiatal hernia associated with reflux esophagitis since anticholinergic drugs may aggravate this condition.

It should be noted that the use of anticholinergic/antispasmodic drugs in the treatment of gastric ulcer may produce a delay in gastric emptying time and may complicate such therapy (antral stasis). Do not rely on the use of the drug in the presence of complication of biliary tract disease. Investigate any tachycardia before giving anticholinergic (atropine-like) drugs since they may increase the heart rate. With overdosage, a curare-like action may occur. **ADVERSE REACTIONS:** Anticholinergics/antispasmodics produce certain effects which may be physiologic or toxic depending upon the individual patient's response. The physician must delineate these. Adverse reactions may include xerostomia; urinary hesitancy and retention; blurred vision and tachycardia; palpitations, mydriasis, cycloplegia; increased ocular tension; loss of taste; headache; nervousness; drowsiness; weakness; dizziness; insomnia; nausea; vomiting; impotence; suppression of lactation; constipation; bloated feeling; severe allergic reaction or drug idiosyncrasies including anaphylaxis; urticaria and other dermal manifestations; some degree of mental confusion and/or excitement, especially in elderly persons; and decreased sweating. With the injectable form there may be a temporary sensation of lightheadedness and occasionally local irritation. **DOSAGE AND ADMINISTRATION:** Dosage must be adjusted to individual patient's needs.

Usual Dosage: Bentyl 10 mg capsule and syrup: Adults: 1 or 2 capsules or teaspoonfuls syrup three or four times daily. Children: 1 capsule or teaspoonful syrup three or four times daily. Infants: ½ teaspoonful syrup three or four times daily. (May be diluted with equal volume of water.) Bentyl 20 mg: Adults: 1 tablet three or four times daily. Bentyl Injection: Adults: 2 mL (20 mg.) every four to six hours intramuscularly only. NOT FOR INTRAVENOUS USE. **MANAGEMENT OF OVERDOSE:** The signs and symptoms of overdose are headache, nausea, vomiting, blurred vision, dilated pupils, hot, dry skin, dizziness, dryness of the mouth, difficulty in swallowing, CNS stimulation. Treatment should consist of gastric lavage, emetics, and activated charcoal. Barbiturates may be used either orally or intramuscularly for sedation but they should not be used if Bentyl with Phenobarbital has been ingested. If indicated, parenteral cholinergic agents such as Urecholine® (bethanechol chloride USP) should be used.

Product Information as of October, 1976

Lt. Edward Mamet is Commander of the Ninth Precinct Investigations Unit, one of the toughest police commands in N.Y.C.

He has one leg.

"When I first came out of the hospital," says Edward Mamet, "people didn't know how to treat me. They had to act nice, open doors...it's awkward. Even this one ranking officer with a reputation for chewing people out kept treating me with kid gloves. I felt a lot better when, after about two weeks, he saw I was getting around alright, and started treating me like everyone else..."

Lt. Edward Mamet was 37 when he lost his left leg in an accident three years ago. Everyone encouraged him to take his \$14,000 pension and retire, but he refused. He had

been on his way up, and he felt that if he retired he would just vegetate. He convinced his superiors to return him to duty, but out of concern for his safety they gave him a desk job. Paperwork was the last thing he wanted to do. With the help of the police surgeon, who declared him fit for active service, he was able to obtain a transfer. Soon after, he earned a promotion. Now he's supervising a team of 14 detectives and a sergeant, investigating unsolved crimes on the Lower East Side. He feels he does almost as well as before, and intends eventually to become a captain.

"I've chosen to perform," he says, "therefore I have to prove I can do it." He tests himself constantly. During New York's coldest and iciest winter in 90 years, he did not slip once.

Skilled Orders Get Skilled Care

By FRED R. T. NELSON, MD and LEE ELIZABETH BRITTON, MA

Dr. Nelson is a graduate of the University of Maryland Medical School. He completed his Internship and Residency in orthopedic surgery at Bethesda Naval Medical Center, where he was Director of Training and Research in Orthopedics from 1972-1975. Dr. Nelson has been in private practice since 1975, and is a member of the medical staff of Suburban Hospital. He is a Clinical Instructor in Orthopedic Surgery at George Washington University, Medical Director of Manor Care of Adelphi Nursing Home and co-author of Manual of Orthopedic Terminology, which was recently released by C.B. Mosby.

Ms. Britton is Executive Director of the Montgomery County Medical Care Foundation. She received her Master of Arts degree in Sociology from the University of Maryland. Contact her for reprint and other data at Suite 202, 11141 Georgia Ave., Wheaton, MD 20902.

Abstract

Nursing homes have experienced significant advances in recent years. They now have the capacity to provide a wide range of skilled services, including nursing care, physical, occupational and speech therapy and social work services. The physician will obtain the full benefits of these services for his or her patients only if he or she clearly communicates the patient's previous condition, present needs and long-range goals.

Introduction

The authors have seen two common problems in the care of the nursing home patient. The first is the limited knowledge many physicians have of the services now provided in nursing homes, and our discussion will focus first on the types of services now available. The second problem we have seen is the poor communication between the physician, nurse, social worker and therapists concerning the patient's condition and prognosis. Being unaware of skilled services, complicated by poor communication, can lead to underutilization of nursing home services and personnel.

Perhaps it would be best to begin this discussion by briefly comparing long-term care institutions of 30 years ago with those of today. In the past, many homes were for residential care only. They may have provided support in the activities of daily living, and certain simple medications, but they generally did not provide skilled nursing care. In many instances, the staff in homes for the aged were not licensed professionals, had no special training in the care of the aged and provided supportive, rather than recuperative, care. The nursing home was therefore often seen as an institution for incurables.

This view was held by both the general population and also by the health professions, particularly physicians. There has been very little in the formal education of most physicians to change that outlook. Medical schools have only recently recognized the tremendous

amount of effort invested in the care of the elderly, and the need to educate new physicians—both in the means of delivering geriatric care and in the services available in the nursing home.

Types of Patients

The authors believe that nursing homes should be viewed as multipurpose facilities. Properly-staffed, they can care for a wide variety of patients, from the post-hospital patient who will eventually be discharged to home, to the senile patient who needs a supervised environment, to the terminal patient. The following section will discuss these different types of patients in more detail.

The nursing home is often a point of transition between hospital and home. For example, a patient who has experienced a hip fracture may need one-three weeks of hospital care for initial treatment and stabilization. Several more weeks of care in a skilled nursing facility may be needed to continue daily physical therapy and nursing observation. During the nursing home stay, the patient can regain the ability to perform the activities of daily living, and become independent once again.

The extended care facility can also represent a permanent place of residence. This does not necessarily mean that the individual has no potential for improvement and greater self-sufficiency. A period of intensive rehabilitative therapy may be necessary after admission to help the patient recover the skills necessary to bathe and dress, and to be able to go to the dining room independently. Ongoing maintenance therapy may also be necessary to keep the patient functioning with some independence. Even so, the intensive rehabilitative effort made after admission may reduce the care the patient needs later.

Finally, it should be recognized that there are patients for whom there will not be improvement. Obviously, this is true for severely and irreversibly senile individuals, and some who are terminally-ill. Severely senile individuals require constant supervision, which is available in a nursing home to assure that they eat regularly and maintain good hygiene. While many terminally-ill patients can be cared for at home, some cannot due to the type and method of administration of pain medications.

Types of Services

The physician must know what is available in today's nursing home if he or she is to meet the needs of the above types of patients. The average extended-care facility has social workers, registered and licensed prac-

tical nurses, physical therapists, occupational therapists, dieticians and speech therapists on its staff, either as employees or consultants.

The role of the social worker is the initial one in most homes and often involves a preadmission visit by relatives. The social worker reviews the patient's economic position and social history with the patient and/or family. This conference determines the patient's needs and preferences, and leads to plans for activities within the facility and to setting goals (such as ambulation and discharge).

Registered nurses play a crucial role in all of these institutions. These nurses could justifiably be called subspecialty nurses because of their experience in providing care to an older population. There are very few specialty training centers for these nurses. However, through extensive experience in caring for the aged, many have become skilled at seeing the signals of improvement or deterioration in each individual patient. They are able to assess the social, medical and personal factors that make the patient a more happy, productive and independent person, not only within the institution, but potentially within their own homes. The range of services varies depending on the size of the nursing staff. Some homes are able to provide such intensive services as respiratory care, IVs and management of patients in unstable conditions.

Registered nurses are responsible for numerous personnel who care for these patients, and, in particular, for nursing assistants. It is not uncommon to find that many nursing assistants also become skilled observers and are able to help patients benefit from the facility's program and reach their rehabilitation potential.

Physical therapists and physical therapy equipment are present in most of the institutions. As a part of the conditions for participation for Medicare, physical therapists must be treating the patient on a daily basis. As it turns out, they usually see patients five times a week. At a minimum, exercises on parallel bars, training in the use of crutches or a walker and whirlpool baths are available in the physical therapy department. Nursing homes with more extensive staff and equipment can provide intermittent cervical traction, pelvic traction, diathermy, high-frequency sound and other types of treatments. In order to meet Medicare skilled care requirements, physical therapy must be available on a five times per week basis.

Physical therapists are directly involved with assessing patients transferred from the hospital. They help in defining level of function at the time of admission and in predicting what progress the patient should make, in terms of their own professional experience. The physical therapist working within these institutions is aware of the long-term aspects of care, particularly when dealing with patients who have had strokes and major fractures. It is important to see the physical therapist as a member of the team, because without his/her help and assessment, changes in the patient might go unnoticed, and the patient's return to independence would be delayed. In the ideal setting, there is an interchange between the physical therapist, the nurse and the

physician. Unfortunately, it is rare for all three to be in the facility at the same time. This results in a loss of communication that leads to delay in modifying the patient's treatment plan, and is something that the physician should consider on the return visit to the long-term care facility.

Occupational therapists are increasingly important to long-term care facilities. The occupational therapist is too often thought of as somebody who helps the patient with basket weaving. Actually the occupational therapist is an extremely significant person, who is involved in assessing how the patient manages his/her own personal needs and how he/she functions in a group setting. The therapist also assesses the patient's potential for independence. The occupational therapy is directed at activities that will make patients satisfied with their placement in the institutional setting. Many persons arriving in a nursing home approach it with a negative outlook, feeling that their stay in the institution may become a permanent one. A good occupational therapist will help the patient find goals within the institution, make himself/herself useful, and take an active interest in his/her own physical improvement and well-being.

Again, the communication between the occupational therapist, the registered nurse and the physician is generally poor. Usually, the physical therapist and the occupational therapist communicate more frequently and easily with the registered nurse on the floor because they are the primarily involved members of the health-care delivery team. They are the ones who are in direct contact with the patient every day, whereas the physician sees the patient less often.

Speech therapy is generally available from visiting consultants, especially for those patients who have had strokes. Speech assessment is now becoming a diagnostic tool; it is used not only at the time of arrival in the extended-care facility, but also as an indication that physical, occupational and other therapies may also be indicated. The assessment on admission determines the patient's present level of functioning and potential for improvement. A treatment plan is then developed, and generally involves therapy from one to five times a week, either on an individual or group basis.

The speech therapist is also involved in a continuing reevaluation of the patient's condition. Improvements beyond what was expected may indicate that the patient has potential for improvement in other areas. Conversely, changes for the worse may indicate the development of a new medical problem, or of a psychological problem.

Getting Your Patient the Care You Want

The coordination of all of these services is under the direction of the physician, but in many instances, the daily responsibility is left with the nurse in charge of the unit on which the patient resides. This is a key point that should be remembered by the physician, who should communicate the care plans clearly to the nurse.

The main failure that occurs in the treatment of patients in skilled nursing facilities lies in the transmission of information about the patient. The information known only to the physician is often the most important material. The facility staff is particularly interested in the patient's condition prior to the current illness. Questions that might be considered would be: was the patient independent and able to take care of himself without difficulty; if he was living with someone else, how independent was he of that other person; if he was dependent on other persons, for what kind of assistance, and is it a setting to which the patient could successfully return? A second important factor is the patient's ambulatory status prior to the hospitalization. Often one discovers that while s/he was ambulatory, s/he already was having difficulty and was using a walker, cane or some other appliance. Often where patients were previously institutionalized, it is found that they were only minimally independent in their ambulation at the time of their acute episode.

With no antecedent health information, it is often difficult for the facility staff to evaluate changes which have occurred in a patient while s/he was hospitalized. During the course of the hospitalization, a patient may become either more independent, or less so. What is important to the person receiving the patient in the skilled nursing facility is to know how the independence, ambulatory skills and alertness of this individual have been affected by the present illness and hospitalization. Equally important is how it is likely to be affected on a long-term basis. Often the patient is admitted to a skilled nursing facility with absolutely no record of what his/her prospects for improvement are, and is left in the care of a person who has not previously seen the patient. The time of transfer is particularly difficult for many patients, and their level of alertness may change. It is not uncommon to see a patient doing fairly well with physical therapy in the hospital setting, and then suddenly not do very well in the nursing home. If there is no statement as to previous status and potential for improvement, it is quite possible that this reduced level of ability becomes expected of that patient and his/her recovery remains retarded.

It follows that a full plan of care requires continuous updating. It should be indicated in the progress notes whether the patient is fulfilling (or even exceeding) the expectations of the physician and comparing his/her condition in the hospital to his/her condition in the skilled nursing care facility. The condition of the patient obviously varies from day to day and could influence the assessment depending on the time of the physician's visits. Therefore, the information obtained from the occupational therapists, physical therapists and nurses during the stay in the skilled care facility is vitally important to the physician in understanding the fluctuations in the patient's progress. The physician is generally not in daily attendance to the patient and may not be seeing him more often than once a month. If the patient with potential is not improving, the physician and facility staff must take into account all the variables which can slow progress, such as age, pre-existing infirmities, emboli, congestive heart failure and

advancing senility, to name a few.

This article should alert the physician to the need for a different approach to the management of long-term care patients. The physician must become aware of the services different nursing facilities provide and develop a care plan that uses those services to the best advantage. S/he must also inform the staff of the patient's previous level of independence and what can be expected in the future. Finally, s/he must discuss changes in the patient's condition with the staff, and modify the care plan when changes occur.

This is the only way to assure that the patient receives the type of care s/he needs. ☐

181st ANNUAL MEETING

Medical and Chirurgical Faculty of the State of Maryland

MAY 2-5, 1979

Hunt Valley Inn, Hunt Valley, MD

*Among the topics and speakers at the Annual Meeting are:

WEDNESDAY, MAY 2

MARYLAND SOCIETY OF ALLERGY: "Adverse Reactions to Radiographic Contrast Media." Burton Zwelman, MD, Phila., PA

MARYLAND ORTHOPEDIC SOCIETY: "Arthritis and the Role of Total Joint Replacement," David Hungerford, MD, Baltimore

HOSPITAL-AFFILIATED PHYSICIANS COMMITTEE: Seminar on Negotiations, "Dynamics of Conflict Resolution," Mr. J. Paige Clousson, AMA, Chicago

MARYLAND RADIOLOGICAL SOCIETY: "Computed Tomography of the Body 1979," Stanley S. Siegelman, MD, Baltimore

MARYLAND PSYCHIATRIC SOCIETY: "Teenage Pregnancies," Felix Heald, MD, Baltimore

Other Wednesday program participants are:

Maryland Ophthalmological Society
American College of Surgeons, Maryland Chapter

THURSDAY, MAY 3

MARYLAND DERMATOLOGICAL SOCIETY: "Sexually-Transmitted Diseases," John M. Knox, MD, Houston, TX

MARYLAND SOCIETY OF CARDIOLOGY: "Exercise: Pain or Panacea?" Samuel Fox, III, MD, Washington, DC/"Stress Testing: Who Should Have It?," Nicholas J. Fortuin, MD, Baltimore

MARYLAND UROLOGICAL SOCIETY: "Seminar on Urinary Tract Infection - Current Concepts." Bruce W. Berger, MD; Edward W. Campbell, Jr., MD; Michael J. Droller, MD, Baltimore

COMMITTEE ON ALCOHOLISM, MED-CHI: "Alcoholism in the Born and Unborn," Stanley Gitlow, MD, New York City, NY. "Fetal Alcohol Syndrome," Charles Whitfield, MD, Baltimore. Moderator: John H. Hirschfeld, MD, Baltimore

JOHN STAIGE DAVIS SOCIETY OF PLASTIC SURGEONS OF MARYLAND: "Myocutaneous Flap." John P. McCraw, MD, Norfolk, VA

COMMITTEE ON PREVENTIVE MEDICINE AND PUBLIC HEALTH, AND SUBCOMMITTEE ON INFECTIOUS DISEASES, MED-CHI: "Use and Abuse of Antibiotics," Michael L. Levin, MD and Clayton Moravec, MD, Baltimore

MARYLAND SOCIETY OF INTERNAL MEDICINE: "The Expanding Use of Computers in Office Practice." Speaker to be announced.

AMERICAN ACADEMY OF FAMILY PHYSICIANS: "Plenary Session on Prospective Medicine," John W. Williamson, MD, Baltimore; Paul C. Brucker, MD, Philadelphia, PA; and Ross Egger, MD, Muncie, IN

Other Thursday program participants are:

Joint Meeting: Maryland Industrial Medical Association/Committee on Occupational Health, Med-CHI

FRIDAY, MAY 4

COGGINS LECTURE ON GERIATRICS: "Essentials in Care of the Elderly," William Reichel, MD, Baltimore

GENETICS PROGRAM: Faculty of Johns Hopkins. Specific topics and speakers to be announced.

MARYLAND STATEWIDE PSRO COUNCIL: "PSRO and its Effect on Your Practice," John Bussman, MD, Portland, OR;

Emidio A. Bianco, MD, Baltimore; Mr. John J. Kent, Jr., Baltimore

OBSTETRICAL AND GYNECOLOGICAL SOCIETY OF MARYLAND: "The Health Care Delivery System in Obstetrics and Gynecology, Present and Future," Irving Kushner, MD

MARYLAND SOCIETY OF PATHOLOGISTS: Topic to be announced. Elaine Jaffee, MD, Bethesda

JOINT MEETING: COMMITTEES ON PHYSICIAN REHABILITATION AND PEER REVIEW, MED-CHI, COMMISSION ON MEDICAL DISCIPLINE, STATE OF MARYLAND: "Seminar on the Impaired Physician." Speakers to be announced.

DEPARTMENT OF FAMILY PRACTICE, UNIVERSITY OF MARYLAND HOSPITAL: "Medical Records for Continuity of Patient Care." Speaker to be announced.

MARYLAND-DC SOCIETY OF ANESTHESIOLOGISTS: Topic and speaker to be announced.

MARYLAND SOCIETY OF OTOLARYNGOLOGY: "Speech Disorders." Speakers to be announced.

MARYLAND SOCIETY OF NUCLEAR MEDICINE: "Recent Advances in Clinical Nuclear Medicine," Gerald S. Freedman, MD, New Haven, CT

KRESS MEMORIAL LECTURE: "The Pulmonary Manifestations of Collagen-Vascular Diseases," Allen R. Myers, MD, Philadelphia, PA

MARYLAND SOCIETY OF REHABILITATION MEDICINE: "Current Office Diagnosis and Management of Musculoskeletal Pain Syndrome," Lionel A. Wolpin, MD, Los Angeles

Other Friday program participants are:

American Academy of Pediatrics, Maryland Chapter
American College of Emergency Physicians, Maryland Chapter
American Diabetes Association, Maryland Affiliate, Inc.
American Heart Association, Maryland Affiliate, Inc.

*Topics subject to change. Please consult Advance and Final Programs for more current information.

The Great Laxative Escape

COLACE[®]

dioctyl sodium sulfosuccinate

Colace means escape—from laxative stimulation, from laxative harshness, from laxative habit! Colace gently helps soften stools for easy, painless, unstrained elimination. It's the great laxative escape, from infancy to old age. Available in 100 and 50 mg. capsules. Syrup or liquid.

Mead Johnson

PHARMACEUTICAL DIVISION

©1978 Mead Johnson & Company • Evansville, Indiana • U.S.A. 35/8-1

This asthmatic isn't worried about his next breath...

he's active
he's effectively
maintained on

QUIBRON[®]

Each capsule or tablespoonful (15 ml) liquid
contains theophylline (anhydrous) 150 mg
and glyceryl guaiacolate (guaifenesin)
90 mg

- theophylline for effective
around-the-clock
bronchodilator therapy
- 100% free theophylline

Indications: For the symptomatic relief of bronchospastic conditions such as bronchial asthma, chronic bronchitis, and pulmonary emphysema.

Warnings: Do not administer more frequently than every 6 hours, or within 12 hours after rectal dose of any preparation containing theophylline or aminophylline. Do not give other compounds containing xanthine derivatives concurrently.

Precautions: Use with caution in patients with cardiac disease, hepatic or renal impairment. Concurrent administration with certain antibiotics, i.e., clindamycin, erythromycin, troleandomycin, may result in higher serum levels of theophylline. Plasma prothrombin and factor V may increase, but any clinical effect is likely to be small. Metabolites of guaifenesin may contribute to increased urinary 5-hydroxyindoleacetic acid readings, when determined with nitrosonaphthol reagent. Safe use in pregnancy has not been established. Use in case of pregnancy only when clearly needed.

Adverse Reactions: Theophylline may exert some stimulating effect on the central nervous system. Its administration may cause local irritation of the gastric mucosa, with possible gastric discomfort, nausea, and vomiting. The frequency of adverse reactions is related to the serum theophylline level and is not usually a problem at serum theophylline levels below 20 mcg/ml.

How Supplied: Capsules in bottles of 100 and 1000 and unit-dose packs of 100. Liquid in bottles of 1 pint and 1 gallon.

See package insert for complete prescribing information.

Mead Johnson

PHARMACEUTICAL DIVISION

© 1979 Mead Johnson & Company • Evansville, Indiana 47721 U.S.A. MJL 6-4220R4

Before prescribing, please consult complete product information, a summary of which follows:

The effectiveness of Valium (diazepam) in long-term use, that is, more than 4 months, has not been assessed by systematic clinical studies. The physician should periodically reassess the usefulness of the drug for the individual patient.

Contraindications: Tablets in children under 6 months of age, known hypersensitivity; acute narrow angle glaucoma; may be used in patients with open angle glaucoma who are receiving appropriate therapy.

Warnings: As with most CNS-acting drugs, caution against hazardous occupations requiring complete mental alertness (e.g., operating machinery, driving). Withdrawal symptoms (similar to those with barbiturates, alcohol) have occurred following abrupt discontinuance (convulsions, tremor, abdominal/muscle cramps, vomiting, sweating). Keep addiction-prone individuals (drug addicts or alcoholics) under careful surveillance because of predisposition to habituation/dependence.

Usage in Pregnancy: Use of minor tranquilizers during first trimester should almost always be avoided because of increased risk of congenital malformations, as suggested in several studies. Consider possibility of pregnancy when instituting therapy; advise patients to discuss therapy if they intend to or do become pregnant.

ORAL. Advise patients against simultaneous ingestion of alcohol and other CNS depressants.

Not of value in treatment of psychotic patients; should not be employed in lieu of appropriate treatment. When using oral form adjunctively in convulsive disorders, possibility of increase in frequency and/or severity of grand mal seizures may require increase in dosage of standard anticonvulsant medication; abrupt withdrawal in such cases may be associated with temporary increase in frequency and/or severity of seizures.

INJECTABLE. To reduce the possibility of venous thrombosis, phlebitis, local irritation, swelling, and, rarely, vascular impairment when used I.V.: inject slowly, taking at least one minute for each 5 mg (1 ml) given; do not use small veins, i.e., dorsum of hand or wrist; use extreme care to avoid intra-arterial administration or extravasation. Do not mix or dilute Valium with other solutions or drugs in syringe or infusion flask. If it is not feasible to administer Valium directly I.V., it may be injected slowly through the infusion tubing as close as possible to the vein insertion.

Administer with extreme care to elderly, very ill, those with limited pulmonary reserve because of possibility of apnea and/or cardiac arrest; concomitant use of barbiturates, alcohol or other CNS depressants increases depression with increased risk of apnea; have resuscitative facilities available. When used with narcotic analgesic eliminate or reduce narcotic dosage at least 1/3; administer in small increments. Should not be administered to patients in shock, coma, acute alcoholic intoxication with depression of vital signs.

Has precipitated tonic status epilepticus in patients treated for petit mal status or petit mal variant status.

Withdrawal symptoms (similar to those with barbiturates, alcohol) have occurred following abrupt discontinuance (convulsions, tremor, abdominal/muscle cramps, vomiting, sweating). Keep addiction-prone individuals under careful surveillance because of predisposition to habituation/dependence. Not recommended for OB use.

Efficacy/safety not established in neonates (age 30 days or less); prolonged CNS depression observed. In children, give slowly (up to 0.25 mg/kg over 3 minutes) to avoid apnea or prolonged somnolence; can be repeated after 15 to 30 minutes. If no relief after third administration, appropriate adjunctive therapy is recommended.

Precautions: If combined with other psychotropics or anticonvulsants, carefully consider individual pharmacologic effects—particularly with known compounds which may potentiate action of Valium (diazepam), i.e., phenothiazines, narcotics, barbiturates, MAO inhibitors and antidepressants. Protective measures indicated in highly anxious patients with accompanying depression who may have suicidal tendencies. Observe usual precautions in impaired hepatic function; avoid accumulation in patients with compromised kidney function. Limit oral dosage to smallest effective amount in elderly and debilitated to preclude ataxia or oversedation (initially 2 to 2½ mg once or twice daily, increasing gradually as needed or tolerated).

INJECTABLE. Although promptly controlled, seizures may return; readminister if necessary; not recommended for long-term maintenance therapy. Laryngospasm/increased cough reflex are possible during peroral endoscopic procedures; use topical anesthetic; have necessary countermeasures available. Hypotension or muscular weakness possible, particularly when used with narcotics, barbiturates or alcohol. Use lower doses (2 to 5 mg) for elderly/debilitated.

Adverse Reactions: Side effects most commonly reported were drowsiness, fatigue, ataxia. Infrequently encountered were confusion, constipation, depression, diplopia, dysarthria, headache, hypotension, incontinence, jaundice, changes in libido, nausea, changes in salivation, skin rash, slurred speech, tremor, urinary retention, vertigo, blurred vision. Paradoxical reactions such as acute hyperexcited states, anxiety, hallucinations, increased muscle spasticity, insomnia, rage, sleep disturbances and stimulation have been reported, should these occur, discontinue drug.

Because of isolated reports of neutropenia and jaundice, periodic blood counts, liver function tests advisable during long-term therapy. Minor changes in EEG patterns, usually low-voltage fast activity, have been observed in patients during and after Valium (diazepam) therapy and are of no known significance.

INJECTABLE. Venous thrombosis/phlebitis at injection site, hypoactivity, syncope, bradycardia, cardiovascular collapse, nystagmus, urticaria, hiccups, neutropenia.

In peroral endoscopic procedures, coughing, depressed respiration, dyspnea, hyperventilation, laryngospasm/pain in throat or chest have been reported.

Management of Overdosage: Manifestations include somnolence, confusion, coma, diminished reflexes. Monitor respiration, pulse, blood pressure; employ general supportive measures, I.V. fluids, adequate airway. Use levarterenol or metaraminol for hypotension, caffeine and sodium benzoate for CNS-depressive effects. Dialysis is of limited value.

Supplied: Tablets, 2 mg, 5 mg and 10 mg, bottles of 100 and 500; Tel-E-Dose* (unit dose) packages of 100, available in trays of 4 reverse-numbered boxes of 25, and in boxes containing 10 strips of 10; Prescription Paks of 50, available singly and in trays of 10. Ampuls, 2 ml, boxes of 10, Vials, 10 ml, boxes of 1, Tel-E-Ject* (disposable syringes), 2 ml, boxes of 10. Each ml contains 5 mg diazepam, compounded with 40% propylene glycol, 10% ethyl alcohol, 5% sodium benzoate and benzoic acid as buffers, and 1.5% benzyl alcohol as preservative.

A full range of treatment...

As an Air Force physician, you may practice your specialty in modern, well-equipped facilities with a complete support staff.

In addition to the wide spectrum of clinical experience you'll gain, you'll have administrative support to alleviate most of the clerical workload. The type of medicine you will practice is based on the needs of your patients, regardless of their financial status.

For yourself and your family, Air Force medicine will provide reasonable working hours, excellent pay, 30 days of paid vacation each year, and many other benefits.

Consider the Air Force Medical Corps – a reasonable alternative for today's physicians.

Are Billing and Receivables Important to You?

CAS means: **effective patient** **account management**

CAS Provides a "Results" System Tailored to Your Needs

- is designed specifically for group practice management needs;
- is user-controlled and directed for assured accuracy and efficiency;
- can be effectively operated by non-technical administrative personnel;
- provides fast, accurate, reliable billing to all parties;
- provides automatic rebilling and collection follow-up;
- issues timely and effective practice activity reports;
- is kept up-to-date by professional group practice managers;
- improves cash flow;
- increases total collections;
- is fully confidential.

CAS' Staff are experienced Group Practice Managers! We are available for management consultation. We monitor the business practice issues especially those related to third party payors and government units. This monitoring makes it possible for CAS to implement carefully thought-out plans rather than reacting to unnecessary crises.

Our pricing structure is based on our performance and is very competitive; you only pay for the bills, statements and reports produced. We depend on our performance which assures you

peace-of-mind. The CAS System pays for itself!

Headquartered in Baltimore, CAS effectively serves this region by providing its computerized system as a tool for your management or by providing total patient account management services.

For the best results from patient account management, enter into a CAS partnership. Call or write for a free brochure.

I would like more information about how CAS can make my patient account management task easier:

- ☐ Have someone call to discuss my requirements.
☐ Send me more information.

VALIUM®
(diazepam) 

2-mg, 5-mg, 10-mg scored tablets

VALIUM® (diazepam)

Before prescribing, please consult complete product information, a summary of which follows:

Indications: Tension and anxiety states, somatic complaints which are concomitants of emotional factors; psychoneurotic states manifested by tension, anxiety, apprehension, fatigue, depressive symptoms or agitation, symptomatic relief of acute agitation, tremor, delirium tremens and hallucinosis due to acute alcohol withdrawal, adjuvantly in skeletal muscle spasm due to reflex spasm to local pathology, spasticity caused by upper motor neuron disorders, ataxic, stiff-man syndrome, convulsive disorders (not for sole therapy).

The effectiveness of Valium in long-term use, that is, more than 4 months, has not been assessed by systematic clinical studies. The physician should periodically reassess the usefulness of the drug for the individual patient.

Contraindicated: Known hypersensitivity to the drug. Children under 6 months of age. Acute narrow angle glaucoma, may be used in patients with open angle glaucoma, who are receiving appropriate therapy.

Warnings: Not of value in psychotic patients. Caution against hazardous occupations requiring complete mental alertness. When used adjuvantly in convulsive disorders, possibility of increase in frequency and/or severity of grand mal seizures may require increased dosage of standard anticonvulsant medication, abrupt withdrawal may be associated with temporary increase in frequency and/or severity of seizures. Advise against simultaneous ingestion of alcohol and other CNS depressants. Withdrawal symptoms (similar to those with barbiturates and alcohol) have occurred following abrupt discontinuance (convulsions, tremor, abdominal and muscle cramps, vomiting and sweating). Keep addiction-prone individuals under careful surveillance because of their predisposition to habituation and dependence.

Use in Pregnancy: Use of minor tranquilizers during first trimester should always be avoided because of increased risk of congenital malformations as suggested in several studies. Consider possibility of pregnancy when instituting therapy; advise patients to discuss therapy if they intend to or do become pregnant.

Precautions: If combined with other psychotropics or anticonvulsants, consider carefully pharmacology of agents employed; drugs such as phenothiazines, narcotics, barbiturates, MAO inhibitors and other antidepressants may potentiate its action. Usual precautions indicated in patients severely depressed, or with latent depression, or with suicidal tendencies. Observe usual precautions in impaired renal or hepatic function. Limit dosage to smallest effective amount in elderly and debilitated to preclude ataxia or oversedation.

Side Effects: Drowsiness, confusion, diplopia,

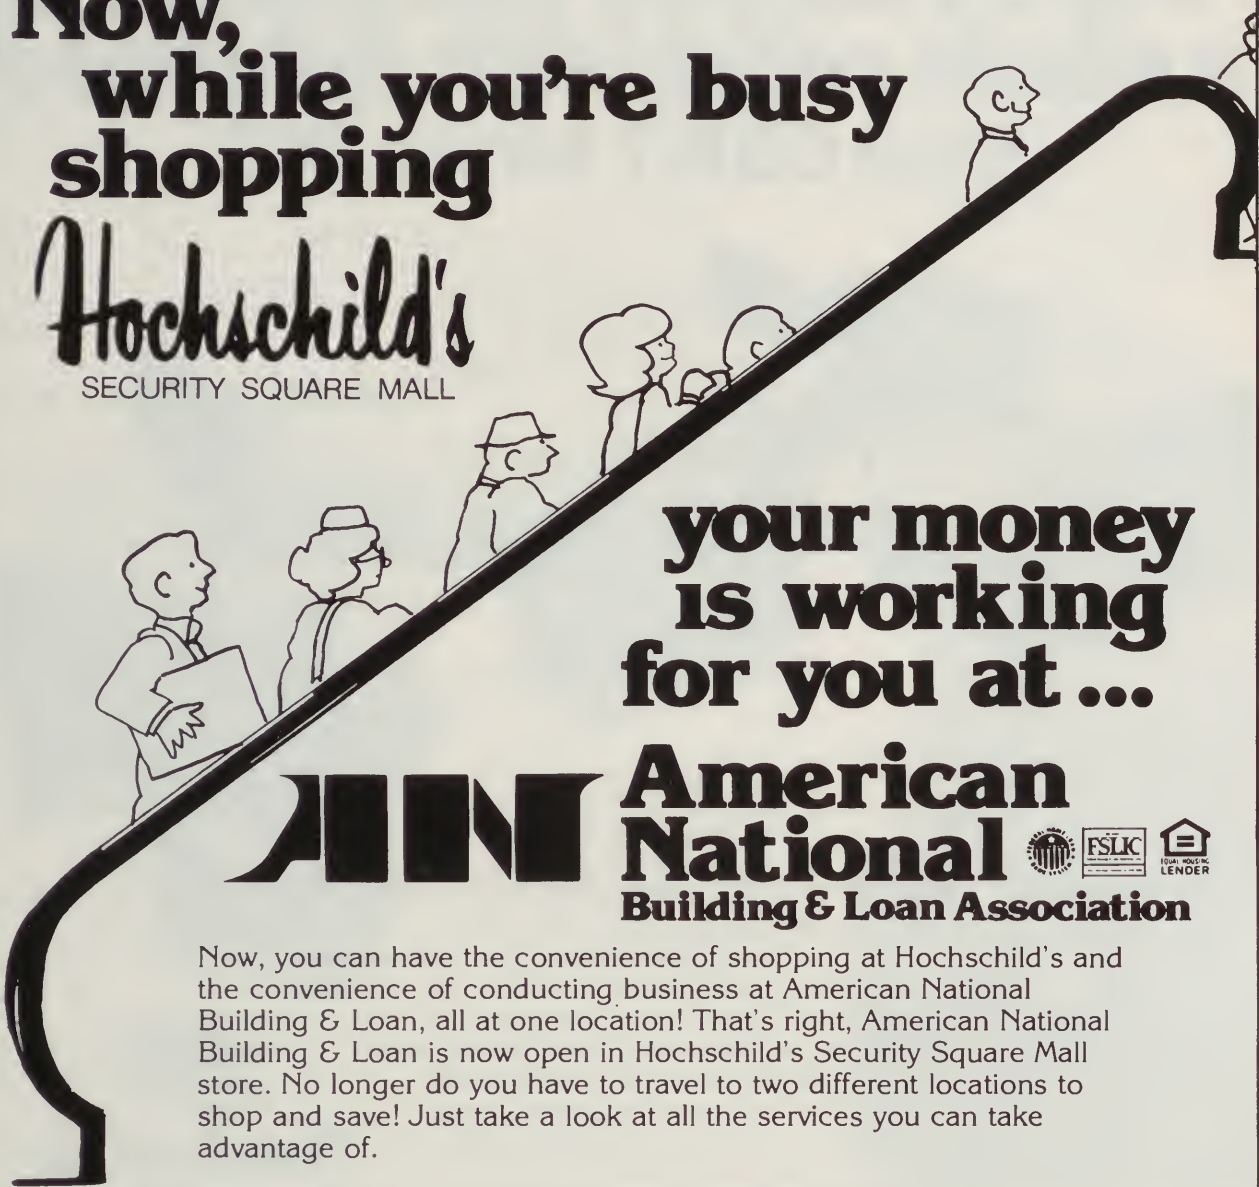

hypotension, changes in libido, nausea, fatigue, depression, dysarthria, jaundice, skin rash, ataxia, constipation, headache, incontinence, changes in salivation, slurred speech, tremor, vertigo, urinary retention, blurred vision. Paradoxical reactions such as acute hyperexcited states, anxiety, hallucinations, increased muscle spasticity, insomnia, rage, sleep disturbances, stimulation have been reported, should these occur, discontinue drug. Isolated reports of neuroleptic jaundice, periodic blood counts and liver function tests advisable during long-term therapy.

7% of the population may be harboring latent or dormant tuberculosis*

**Are you testing for it during
routine office physicals?**

*Based on a national estimate of 15 million tuberculin reactors
Stead, W.W. and Bates, J., in Harrison's Principles of Medicine,
8th Edition, 1977, McGraw-Hill, p. 900

✓
LEDERLE Tuberculin, Old

TINE TEST®

An important check in every checkup.

A system, not just a test — supplied with patented induration indicator cards in English or Spanish — simplifies recording and record keeping.

- Over 15 years of use — millions of tests performed each year.
- Practical and easy to perform — presterilized; disposable; no refrigeration needed; no needles or syringes.
- Fast — only seconds to perform — can be read in 48-72 hours.

Precautions: Tuberculin testing should be done with caution in persons with active tuberculosis. However, activation of quiescent lesions is rare.

Although clinical allergy to acacia is very rare, this product contains some acacia as a stabilizer and should be used with caution in patients with known allergy to this component. Reactivity to the test may be suppressed in patients who are receiving corticosteroids or immunosuppressive agents, or those who have recently been vaccinated with live virus vaccine such as measles.

With a positive reaction, further diagnostic procedures must be considered. These may include x-ray of the chest, microbiologic examinations of sputa and other

specimens, and confirmation of the positive TINE TEST using the Mantoux method. In general, the TINE TEST does not need to be repeated. Antituberculous chemotherapy should not be instituted solely on the basis of a single positive TINE TEST.

Adverse Reactions: Vesiculation, ulceration, or necrosis may occur at the test site in highly sensitive persons. Pain, pruritus and discomfort at the test-site may be relieved by cold packs or by a topical glucocorticoid ointment or cream. Transient bleeding may be observed at a puncture site and is of no significance.

Again: Hapsburg or Habsburg?

To the Editor:

I agree 100% with Dr. Steingaszner's comment about the distortion of the Habsburg dynasty's family name, which is spelled correctly in European countries, but is misspelled in English-speaking countries. Your analogy of Czar and Tsar is erroneous. You are not taking into consideration that in "Cyrilica," written Russian words transformed into the Latin alphabet will sound differently in different languages according to different pronunciation.

ANDRE V. FESUS, MD, PA
Pravia Med. Ctr.
413 Commonwealth Ave.,
Balto., MD 21228.

(*Managing Editor's Note:* Dr. Fesus refers to the Open Forum letter of Dr. Laszlo C. Steingaszner of Woodbridge, VA, published in the November, 1978 issue concerning the spelling of the name of the former Austrian ruling dynasty, contained in the article **Health in History—"Bertie": Britain's King Edward VII** (September, 1978.) As I replied to Dr. Steingaszner's letter, "The spelling of the family name appears both ways, depending on which article or reference work one consults," and I still stand by that position. On the other hand, after having talked with several German and Austrian-born authorities concerning this, I also believe

WHAT DO YOU THINK OF THE JOURNAL?

that Dr. Fesus' point is well-taken: "... is spelled correctly in European countries, but is misspelled in English-speaking countries." My articles are primarily researched from English-language sources, and are written almost entirely in English, with foreign terms used where appropriate. In future, however, I shall refer only to Habsburgs—with a "b."—BT.) ☐

Practical Advice on Patients Receiving Nasal Applicator Radiotherapy

(A Joint Statement from the Maryland ENT Society, the Department of Otolaryngology, the Johns Hopkins Hospital and the University of Maryland)

Through recent publicity, the association of radiotherapy to the head and region and cancer of the thyroid has become a common concern. There is, indeed, an increased risk in those patients who had such "X-ray treatment" to develop tumors of the thyroid. In the Maryland region, however, there were two different forms of radiotherapy given. The first was the external beam therapy, or where the patient was put in front of a machine. Treatments of this type were generally given for such conditions as an enlarged thymus gland, acne, enlarged adenoids, tonsillitis and ringworm of the scalp. It is this form of radiotherapy that has been associated with thyroid cancer. The manner in which these patients should be handled has been well-outlined in the statement of the Medical and Chirurgical Faculty of the State of Maryland as of Jan. 12, 1977.

The second form of radiotherapy which was commonly used was the nasopharyngeal applicator. This therapy consisted of small metal rods put in the nose, and was useful in treating some forms of hearing loss. This latter form of treatment using the "radium applicator" has not been implicated to date in thyroid cancer or other neoplasia. We, therefore, feel it is important to differentiate the risks of the two forms of therapy. It is the general opinion that anyone exposed to any form of radiotherapy for benign conditions is potentially at risk; however, the patients who received nasopharyngeal applicators need not be handled in the same way as those given external beam therapy. Where doubt exists in a particular patient as to which form of therapy was used, one must assume that the external treatments were employed.

A retrospective study is being started in order to evaluate patients who underwent applicator therapy. This study should assist us in administering care to this group in the future. At the present time, however, we feel that no recall of such patients is necessary. In the case of those patients who present themselves for examination, having received nasal applicator treatments, a complete head and neck examination should be performed including nasopharyngeal examination, as well as palpation of the salivary glands and thyroid.

The need for follow-up examination can be determined by the individual physician at that time. ☐

Accept no substitute for your professional judgment

As a physician, you have the right to prescribe the drug which you believe will most benefit your patients. Now, substitution laws make it more difficult to exercise that right. In many states, unless you specifically direct pharmacists to dispense your brand-name prescription as written, they may be required by law to substitute another drug for your brand-name prescription.

This means that the ultimate drug selection is no longer yours; its source is left to the pharmacist's discretion. You will have forfeited your right to prescribe as you see fit. Preserve your rights. Specify that you will accept no substitution.

When you accept no substitutes...

- You ensure that your patient receives exactly that product you have specified on your prescription
- You choose the quality of the product dispensed to your patient
- You can exercise the right to select a product based upon its proven therapeutic performance and to select a manufacturer that stands behind its brand name or generic product
- You can support the kinds of research programs that are vital to new drug discovery and development
- You can help sustain important physician, pharmacist and patient education services supported by innovative, research-oriented firms

For complete information on the drug substitution law effective in your state, please consult your local Pfizer Representative.

Your Medical Faculty At Work

JOHN SARGEANT, CAE, Executive Director

Executive Committee

The Executive Committee met on Jan. 11, 1979 and took the following actions:

1. Received a delegation from the Program and Arrangements Committee to discuss site locations for Faculty Semiannual Meetings and advised these representatives that the Committee had authority to recommend sites to the Council for Semiannual Meeting locations; also, that it could invite the incoming member of the Committee to attend Committee meetings prior to formal commencement of his term on the Committee.

The Executive Committee in response to requests from this group referred the following to the Policy and Planning Committee for consideration and recommendation:

1. Determination as to whether or not the Faculty's Semiannual sessions should be held out of state or stay within the geographical confines of Maryland or be held only within a certain defined area outside of Maryland.

2. Determine the manner in which such sites should be selected, if they are to be held outside of the State of Maryland and the manner of underwriting costs for this activity.

3. Determine the appropriate method of handling the arrangements after the site is selected and approved by the Council, that is either through the services of a travel agent or through negotiations by staff or the appropriate Faculty committee.

4. Coordination of trips with Component Society activities as well as pleasure travel offered Faculty members at no cost to the Faculty.

5. Approved the budget for recommendation to the Council for the 1979 calendar year, recognizing a budget deficit which would be funded from Faculty reserves.

6. Referred to the Policy and Planning Committee the question of means of financing any future budgetary deficits that may occur with the understanding that any precipitous dues increase should be avoided.

7. Approved having two Faculty members meet with Auxiliary counterparts for the purpose of discussing what, if anything, can be done in connection with family relations of members.

8. Heard a request from the Maryland Chapter of the American College of Emergency Physicians that consideration be given to designation of one of its members to serve on some Blue Shield committee.

9. Approved participation in a study currently planned on Hospital In-patient Quality of Care as a joint venture with the Maryland Hospital Association.

The following were selected to serve in this capacity:

David Solomon, MD, Baltimore City

Watson P. Kime, MD, Baltimore City

David S. McHold, MD, Annapolis

10. Approved nominees for Council action for possible appointment to the Maryland Blue Shield Board and committees of Blue Shield.

11. Adopted an addition to personnel policies dealing with reimbursement for meals of staff while on Faculty business.

12. Authorized the Council Chairman to meet with interested parties to review various regulations dealing with nurse roles in the practice of medicine and to develop testimony on these proposals for the public hearing or move in a legal manner if that is appropriate.

13. Heard that the State Health Planning Agency is moving ahead with Appropriateness Review of Institutional Facilities and approved appointment of various physicians to committees working on this activity.

14. Approved expenditure of funds from the CME Committee dedicated fund to provide for membership on the National Council of State Committees on CME.

Executive Director's Newsletter

March, 1979

TWO Two physicians have won national awards in the 1978 AMA
National Contest for Medical Society Speakers Bureaus.

WINNERS

Raymond J. Donovan, MD, Baltimore, won first place in the
Radio Talk Show category, and J. Roy Guyther, MD, Mechanics-
ville, won second place in the professional audience category.

MARYLAND

The Faculty receives \$1,000.00 cash as a result of Dr.
Donovan's prize and \$500.00 as a result of Dr. Guyther's
award. Both contestants receive an appropriate trophy.

The awards were made during the AMA National Leadership Con-
ference in Chicago in February.

YOU ARE

Frequently, physicians will indicate that the Component
Medical Society or the Faculty, to which they belong, is a
separate entity and they have no connection with either of
these two groups when policies are enunciated one way or the
other.

THE

MEDICAL

SOCIETY

This is particularly true during legislative sessions at the
General Assembly, when we find physicians, on occasion, taking
a different position and campaigning actively against the
Faculty's position on a particular issue.

The medical society, at a local or state (and also national)
level is the physician — if your position disagrees with that
of the formal group, it is not necessarily bad. However, we
urge that prior to speaking out, all the facts on the position
taken by any of the groups be obtained.

And, remember, the medical society's position is determined
by physicians who speak on your behalf. Participation by
individuals is important so that all points of view are
considered.

CERTIFICATE

OF NEED

IN PRIVATE

OFFICES

The Faculty has been successful to date in defeating legis-
lation that would extend the Certificate of Need statute in
Maryland to include physicians' offices when equipment ex-
ceeds \$150,000.00 in amount. However, recently the State
Health Coordinating Council went on record as supporting
legislation on a federal level that would include such a
provision.

While hearings are not scheduled as yet on the National Health
Planning Act of 1979, this will undoubtedly be included when
such is introduced. Members are alerted to this issue at this
time, however, for potential future action.

RESOLUTIONS Deadline date for receipt of resolutions for consideration
at the Annual House of Delegates session is Friday, March 9,
DEADLINE 1979. At the time of this writing, no resolutions have
been received.

NOMINATIONS Component medical societies have been solicited for (a)
nominees from which the president will select members of
FOR the Nominating Committee, and (b) nominees for consideration
of the Nominating Committee, when appointed, for submission
FACULTY to the House of Delegates.

POSTS Full details can be obtained from component society officials
or from the Faculty office.

 The deadline for receipt of nominees for the consideration
of the Nominating Committee is Friday, March 16, 1979.

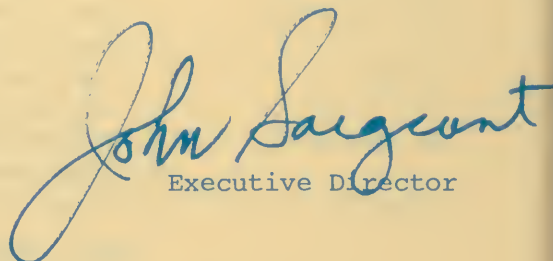

MEMO A request has recently been received from the Maryland Board
of Pharmacy that physicians note specific directions on
FROM medication labels rather than "Take as directed." The
reason for this is that patients often forget directions,
DRUG and those who care for geriatric patients often get a con-
fused idea from the patients as to what the original direc-
COMMITTEE tions were. The Faculty's Committee on Drugs solicits your
cooperation.

LEGISLATIVE The Faculty is again operating a Legislative Hotline to
keep you informed of legislative activity on a current
HOTLINE basis. The toll-free number from anywhere in Maryland and
the District of Columbia is:

1-800-492-9373.

If you wish specifics on any item involving legislation,
contact should be made with the Faculty office at
(301) 539-0872. Those directly involved in legislation are:

John Sargeant
Elza Davis.

IMPAIRED PHYSICIAN'S HOTLINE (301) 467-4224

Money isn't everything.

It's knowing what to do with it that really counts.

Where to invest it. How to make it grow. Get income from it. Minimize risk and taxes.

That's why it pays to have people around you who make it their business to know. Who are investment management experts.

Like the people in the Trust Division at Union Trust Bank.

For the past ten years, our professional managers have consistently outperformed other financial institutions. The pension and profit-sharing funds and individual trusts we've handled have consistently earned top dollar. Our records prove it.

And we're ready to do our best for your portfolio. Now. First, by sitting down together and discussing your plans. Your goals. Your objectives.

Next, we come up with a program custom-fitted to your needs. To your company's future. Or to your family's future.

Then we keep you up to date by phone, personal meetings and newsletters. So you're never out of touch. And we're never out of reach.

If that sounds good to you, we've made it easy for you to get more details on our personal or corporate investment services.

Just call Larry Rosenthal, our man in charge of personal trusts, at 301/332-5515. Or Jay Neale, in charge of employee benefit plans, at 301/332-5877.

What you do with your money is their business.

AUXILIARY ACTIVITIES

A dinner and square dance, cosponsored by the Auxiliary, will be held **Thurs., May 3. No Host Bar: 6:30 PM, Dinner and Square Dance: 7:30-11 PM.** The general meeting will be held on **Fri., May 4, 10 AM**, followed by cocktails and **luncheon** beginning at **NOON.** Auxiliary functions are open to Auxiliary members, their guests and all physicians' spouses.

Everyone is invited to attend. Additional information given at back of program under "MEAL FUNCTIONS AND SOCIAL ACTIVITIES."

Reservations required. Use reservation form at back of this program.

Francis C. Mayle, MD, President

Edward F. Cotter, MD, Chairman Committee on Program and Arrangements

DAILY CONCURRENT SESSIONS COSPONSORED BY MARYLAND SOCIETIES, VOLUNTARY HEALTH ORGANIZATIONS AND COMMITTEES OF THE FACULTY

WEDNESDAY, MAY 2

Concurrent Sessions

**9 AM/MARYLAND ROOMS III AND IV
COUNCIL MEETING**

**9:30 AM/MARYLAND ROOMS III AND IV
HOUSE OF DELEGATES MEETING**

**12:15 PM/HUNT ROOM
MARYLAND MEDICAL POLITICAL ACTION COMMITTEE LUNCHEON**

Topic and Speaker to be announced.

Reservations required. Use reservation form at back of this program.

**2 PM/MARYLAND ROOMS I AND II
MARYLAND RADIOLOGICAL SOCIETY**

Computed Tomography of the Body 1979

Stanley S. Siegelman, MD, Baltimore (1.5 hrs.)

**2 PM/MARYLAND ROOMS III AND IV
AMERICAN COLLEGE OF SURGEONS, MARYLAND CHAPTER**

Topics and Speakers to be announced. (3 hrs.)

**2 PM/PARLOR A
MARYLAND PSYCHIATRIC SOCIETY**

Adolescent Pregnancies

Felix P. Heald, MD, Baltimore (1.5 hrs.)

**2 PM/PARLORS C AND D
MARYLAND SOCIETY OF ALLERGY**

Allergy Diagnosis by RAST

Philip S. Norman, MD, Baltimore

Allergic Reaction to Radiographic Contrast Media

Burton Zweiman, MD, Philadelphia, PA (1.5 hrs.)

**2:30 PM/KING'S PLEASURE ROOM
HOSPITAL-AFFILIATED PHYSICIANS COMMITTEE**

SEMINAR ON NEGOTIATIONS-Dynamics of Conflict Resolution

J. Paige Clousson, JD, Chicago, IL (1.5 hrs.)

**3:30 PM/MARYLAND ROOMS I AND II
MARYLAND OPHTHALMOLOGICAL SOCIETY**

Moderator: **Allan D. Jensen, MD, Baltimore**

Diagnosis and Management of Carotid Occlusive Disease, the Role of Ocular Signs and Symptoms

Neil R. Miller, MD, Baltimore

Glaucoma Medications—Systemic Side Effects

R. D. Richards, MD, Baltimore

Symptoms of Significant Retinal Disease

Robert Liss, MD, Baltimore

Topics to be announced in Final Program.

Stuart Dankner, MD, Baltimore

James Kelley, MD, Baltimore (1.5 hrs.)

**3:30 PM/PARLOR A
MARYLAND ORTHOPEDIC SOCIETY**

The Role of Total Joint Replacement in the Management of Arthritis

David S. Hungerford, MD, Baltimore

Kenneth Krackow, MD, Baltimore (1.5 hrs.)

**5:30 PM/HUNT ROOM
HOSPITALITY NIGHT**

Complimentary Social Hour for members, exhibitors and invited guests.

Reservations required. Use reservation form at back of program.

THURSDAY, MAY 3

CONCURRENT SESSIONS

**7:30 AM/HUNT ROOM
PRAYER BREAKFAST**

What Hath Man Wrought?

Reverend Clyde R. Shallenberger

Director, Chaplaincy Service, Johns Hopkins Hospital, Baltimore

Representatives will deliver brief readings from the following religions:

Buddhism—Krita Apibunyopes, MD

Christian—J. Courtland Robinson, MD

Hindu—Belur S. Bhagavan, MD

Islam—Gholam R. Sadjadi, MD

Jewish—Ira A. Morris, MD

Muslem—Misbah Khan, MD

Reservations required. Use reservation form at back of this program. (1 hr.)

**9 AM/MARYLAND ROOMS I AND II
MARYLAND SOCIETY OF INTERNAL MEDICINE**

The Expanding Use of Computers in Office Practice

Speaker to be announced. (1.5 hrs.)

**9 AM/MARYLAND ROOM III
MARYLAND UROLOGICAL SOCIETY**

URINARY TRACT INFECTIONS—CURRENT CONCEPTS

Etiology of Urinary Tract Infection in Females

Michael J. Droller, MD, Baltimore

Topics to be announced in Final Program

Bruce W. Berger, MD, Baltimore

Edward W. Campbell, Jr., MD, Baltimore (1.5 hrs.)

**9 AM/MARYLAND ROOM IV
OCCUPATIONAL HEALTH COMMITTEE, MED-CHI
and MARYLAND INDUSTRIAL MEDICAL ASSOCIATION**

Approach to Occupational Lung Disease

Stuart Brooks, MD, Cincinnati, OH

Occupational Skin Disease

Edward A. Emmet, MD, MS, Baltimore (1.5 hrs.)

9 AM/PARLOR A

OFFICE ON AGING, STATE OF MARYLAND

Epidemiology of Disability Among the Aged in Rural Maryland

Matthew Tayback, ScD, Baltimore (1.5 hrs.)

9 AM/PARLORS C AND D

SUBCOMMITTEE ON INFECTIOUS DISEASES/COMMITTEE ON PREVENTIVE MEDICINE AND PUBLIC HEALTH, MED-CHI

The Use and Abuse of Antibiotics
Michael L. Levin, MD, Baltimore
Clayton L. Moravec, MD, Baltimore
Stephen Schimf, MD, Baltimore

(1.5 hrs.)

10:30 AM/MARYLAND ROOMS I AND II
MARYLAND DERMATOLOGICAL SOCIETY

Sexually-Transmitted Diseases
John M. Knox, MD, Houston, TX

(1.5 hrs.)

10:30 AM/MARYLAND ROOM III
MARYLAND SOCIETY OF CARDIOLOGY

Exercise: Pain or Panacea?
 Speaker to be announced

Stress Testing: Who Should Have It?
Nicholas J. Fortuin, MD, Baltimore

(1.5 hrs.)

10:30 AM/MARYLAND ROOM IV
COMMITTEE ON ALCOHOLISM, MED-CHI
 Moderator: **John H. Hirschfeld, MD, Baltimore**

The Pharmacological Basis of Alcoholism
Stanley E. Gitlow, MD, New York, NY

Fetal Alcohol Syndrome
Charles L. Whitfield, MD, Baltimore

(1.5 hrs.)

10:30 AM/Parlor A
THE JOHN STAIGE DAVIS SOCIETY OF PLASTIC
SURGEONS OF MARYLAND

New Techniques for Soft Tissue
Replacement—Myocutaneous Flap
John B. McCraw, MD, Norfolk, VA

(1.5 hrs.)

12:15 PM/MARYLAND ROOMS I AND II
ELECTION OF THE BOARD OF MEDICAL EXAMINERS

12:15 PM/HUNT ROOM
LUNCH AND LEARN SESSION

(1.5 hrs.)

Detailed information on each table listed elsewhere in this program. **Preregistration required.** Use reservation form at back of this program.

2 PM/MARYLAND ROOMS I-IV
ACADEMY OF FAMILY PHYSICIANS, MARYLAND CHAPTER

PLENARY SESSION ON PROSPECTIVE MEDICINE

Moderator: **J. Roy Guyther, MD, Mechanicsville**

Panel Participants:

Health Hazard Appraisal:
Reflections and Critique
John W. Williamson, MD, Baltimore

Techniques of Health Hazard Appraisal
Paul C. Brucker, MD, Philadelphia, PA

How to Utilize Prospective Medicine in Daily Practice
Ross Egger, MD, Muncie, IN

(2 hrs.)

4 PM/MARYLAND ROOMS I-IV
GENERAL MEMBERSHIP MEETING

In accordance with Article 5 of the Bylaws, a General Meeting of the Faculty will be held.

All members of the Faculty are invited to attend.

REFERENCE COMMITTEE MEETING

immediately following General Membership Meeting. Any member may speak on the Resolutions and Reference Committee Report that comes before the House of Delegates on Sat., May 5.

6:30 PM/MARYLAND ROOMS I-IV
DINNER AND SQUARE DANCE

6:30 PM — NO HOST BAR

7:30 PM — DINNER

8:30 PM — SQUARE DANCE

Cosponsored by the Auxiliary to BENEFIT AMA-ERF. **Reservations required.** Use reservation form at back of this program.

FRIDAY,
MAY 4

CONCURRENT SESSIONS

9 AM/MARYLAND ROOMS III AND IV
AMERICAN HEART ASSOCIATION,
MARYLAND AFFILIATE, INC.

HYPERTENSION IN MARYLAND: WHAT
WE HAVE ACCOMPLISHED AND WHAT
REMAINS TO BE DONE

Household Survey
Aristide Apostolides, PhD, Baltimore
George Entwisle, MD, Baltimore

What's New in Hypertension?
Edward Freis, MD, Wash., DC (3 hrs.)

9 AM/GARDEN ROOM
MARYLAND-DC SOCIETY OF ANESTHESIOLOGISTS

Local Anesthetics
 Speaker to be announced in Final Program. (1.5 hrs.)

9 AM/Parlor A
AMERICAN ACADEMY OF PEDIATRICS,
MARYLAND CHAPTER

Pediatric Residents' Papers

Other topic and speaker to be announced in Final Program. (1.5 hrs.)

9 AM/Parlors C and D
AMERICAN COLLEGE OF EMERGENCY
PHYSICIANS, MARYLAND CHAPTER

Topic and Speaker to be announced in Final Program. (1.5 hrs.)

9 AM/HUNT ROOM
DEPARTMENT OF FAMILY MEDICINE,
UNIVERSITY OF MARYLAND SCHOOL
OF MEDICINE

The Medical Record, An Absolute in Medical Care

This program will be presented by members of the Department of Family Medicine, University of Maryland School of Medicine, under leadership of **Edward J. Kowalewski, MD.** Additionally, final arrangements are in progress for a most-qualified out-of-state speaker. (1.5 hrs.)

10:30 AM/GARDEN ROOM
MARYLAND SOCIETY OF OTOLARYNGOLOGY

Voice Disorders: Evaluation and Management

Moderator: **Haskins Kashima, MD, Baltimore**

Other program participants to be announced in Final Program. (1.5 hrs.)

A scientific exhibit will be an adjunct to the scientific program.

Exhibit: Voice Disorders: Diagnosis of Laryngeal and Systemic Disorders (An audiovisual exhibit). Participating Institutions: Johns Hopkins University School of Medicine and Loyola College.

10:30 AM/Parlors C and D
AMERICAN DIABETES ASSOCIATION,
MARYLAND AFFILIATE, INC.

New Information About Old and New Insulins
John A. Galloway, MD, Indianapolis, IN (1.5 hrs.)

**12:15 PM/INDOOR POOL AREA
MEET THE SPEAKERS**

The program speakers participating in the **FRIDAY MORNING SESSIONS** will be available to meet with attendees on an informal basis over lunch. **TICKETS FOR A SPECIFIC TABLE MUST BE PURCHASED AT THE DOOR TO THE INDOOR POOL AREA BEGINNING AT NOON FRIDAY.** Lunch will then be obtained from the adjacent Paddock Bar Buffet. Ticket: \$4.50 Complimentary coffee available in Pool Area. **SEATING LIMITED TO 10 PERSONS AT EACH TABLE.**

**12:15 PM/VALLEY BALLROOM
(EXHIBIT HALL)
EXHIBITORS' SWEEPSTAKES**

Drawing for Prizes

1st prize — \$500 CASH

2nd prize — \$200 CASH

See additional information in front of this program under **EXHIBITS.**

**2 PM/MARYLAND ROOMS I AND II
JOHNS HOPKINS UNIVERSITY SCHOOL OF MEDICINE**

Genetics Program

Participants: Faculty of the Johns Hopkins University School of Medicine.

Specific Topics and Speakers will be announced in the Final Program. (3 hrs.)

**2 PM/MARYLAND ROOM III
MARYLAND SOCIETY OF PATHOLOGISTS**

Malignant Lymphomas as Neoplasms of the Immune System
Elaine S. Jaffe, MD, Bethesda (1.5 hrs.)

**2 PM/MARYLAND ROOM IV
LONG TERM CARE COMMITTEE**

Essentials in Care of the Elderly
William Reichel, MD, Baltimore (1.5 hrs.)

**2 PM/GARDEN ROOM
OBSTETRICAL AND GYNECOLOGICAL
SOCIETY OF MARYLAND**

Reproductive Health: New Issues, New Challenges
Irvin M. Cushner, MD, MPH, Washington, DC (1.5 hrs.)

**2 PM/PARLOR A
PEER REVIEW COMMITTEE, COMMITTEE
ON PHYSICIAN REHABILITATION, AND
COMMISSION ON MEDICAL DISCIPLINE**

SEMINAR ON THE IMPAIRED PHYSICIAN

Open Meeting: International Doctors Anonymous, including recovered physicians from Med-Chi's Committee on Physician Rehabilitation.

Daniel J. Anderson, PhD, Center City, MN (3 hrs.)

**2 PM/PARLORS C AND D
MARYLAND SOCIETY OF NUCLEAR MEDICINE**

Advances in Nuclear Medicine . . . for the Practicing Physician
Gerald S. Freedman, MD, New Haven, CT (1.5 hrs.)

**3:30 PM/MARYLAND ROOM III

MEDICINE**

Spine-Related Pain Syndromes: Office Diagnosis and Management
Lionel A. Walpin, MD, Beverly Hills, CA (1.5 hrs.)

**7:30 PM/MARYLAND BALLROOM
PRESIDENTIAL RECEPTION AND BANQUET**

Reservations required. Use reservation form at back of this program.

**SATURDAY,
MAY 5**

**9 AM/MARYLAND ROOMS III AND IV
HOUSE OF DELEGATES MEETING**
(New Council meets immediately following adjournment of House of Delegates)

THIS ANNUAL MEETING SCIENTIFIC PROGRAM IS ACCEPTABLE FOR 18 CATEGORY I CREDIT HOURS FOR THE AMA PHYSICIAN'S RECOGNITION AWARD, AND REQUIRED CREDIT HOURS FOR CONTINUING MEDICAL EDUCATION BY THE MARYLAND STATE BOARD OF MEDICAL EXAMINERS. PRESCRIBED HOURS BY THE AMERICAN ACADEMY OF FAMILY PHYSICIANS HAS BEEN APPLIED FOR.

MEAL FUNCTIONS AND SOCIAL ACTIVITIES

Please use Reservation Form at back of this program to register for all meal functions. All functions to be held at Hunt Valley Inn. **TICKETS WILL NOT BE MAILED, BUT WILL BE HELD AT THE ADVANCE REGISTRATION DESK IN THE REAR OF THE EXHIBIT HALL.**

MMPAC LUNCHEON

The Maryland Medical Political Action Committee Luncheon will be held **WED., MAY 2, 12:15-1:45 PM**, in the Hunt Room. Topic and Speaker will be announced in the Final Program.

Everyone is invited. **Preregistration required. Tickets \$7.50 per person.**

HOSPITALITY NIGHT

This complimentary social hour has proved to be a very enjoyable part of the Annual Meeting, and will be held again this year on **WEDNESDAY, MAY 2, 5:30-7 PM**, Hunt Room. Cocktails and hors d'oeuvres will be served and entertainment will be furnished by a strolling instrumental trio. There is no charge, and tickets will not be distributed; however, you must indicate on the reservation form, at back of this program, the number of reservations you wish to make.

PRAYER BREAKFAST

THURSDAY, MAY 3, 7:30-9 AM is the time scheduled for the Prayer Breakfast, to be held in the Hunt Room. The Speaker will be Reverend Clyde Shallenberger, who will speak on the topic "What Hath Man Wrought?"

This session is approved for one hour of Category I CME credit. **Preregistration required—tickets \$6 per person.**

LUNCH AND LEARN SESSION

These popular round table discussions will be held again on **THURS., MAY 3, 12:15-1:45 PM**, in the Hunt Room. A detailed list of topics to be discussed is published elsewhere in the Advance Program. A number of the tables sell out very early. It is necessary to make your reservation promptly to ensure your choice of tables. **Preregistration required. Tickets \$10 per person.**

DINNER AND SQUARE DANCE

A dinner and square dance cosponsored by the Auxiliary will take place on **THURSDAY, MAY 3**, in the Maryland Ballroom.

6:30 PM — NO HOST BAR

7:30 PM — DINNER

8:30 PM — SQUARE DANCE

Preregistration required—tickets \$17 per person. NO HOST BAR.

MEET THE SPEAKER

A new session this year which will give you an opportunity to meet informally with the Speakers from the Friday morning scientific sessions and discuss their topics. This session will be held from 12:15-1:45 PM around the indoor pool, and tickets must be purchased for specific tables. Tickets will go on sale at **NOON** at the door to the indoor pool area. **Seating limited to 10 persons at each table. Tickets \$4.50 per person.**

AUXILIARY LUNCHEON

All Auxiliary members, spouses, and guests are invited. Luncheon and Cash Bar to be held **FRI., MAY 4**, in the Hunt Room.

12:30 PM — CASH BAR

1 PM — LUNCHEON

Preregistration required. Tickets \$7.50 per person.

PRESIDENTIAL RECEPTION AND BANQUET

The Presidential Reception and Banquet honoring Dr. and Mrs. Francis C. Mayle will be held **FRIDAY, MAY 4, 7:30 PM** in the Maryland Ballroom. Dress is optional. A formal invitation is enclosed with this mailing.

All members and their guests are invited. **Preregistration required. Tickets \$26.50 per person.** (For more details turn page.)

Cover Story:

Acute Mountain Sickness

By JOSEPH E. JENSEN

Mr. Jensen, Faculty Librarian, can be contacted for reprint and other data c/o the Library, Medical and Chirurgical Faculty of the State of Maryland, 1211 Cathedral St., Balto., MD 21201.

Acute mountain sickness is a syndrome resulting from maladjustment to high altitude. The condition is unpleasant, characterized by headache, vomiting, shortness of breath at rest, lassitude and ataxia. It is usually self-limiting.¹⁻² However, there are two potentially fatal variations—high altitude pulmonary oedema and cerebral oedema.

Acute mountain sickness was recognized by 19th Century mountaineering physicians, has been discussed in occasional articles in major medical journals throughout the last 100 years and is mentioned in most 20th Century medical textbooks; however, within the last 15 years, the disease has achieved notoriety. Present-day technology and economic conditions now permit individuals to be at sea level in Baltimore one morning and to be skiing above 10,000 feet in Aspen, CO the next. During the summer months 3,600 people a day drive to the 14,000-foot summit of Pike's Peak.³ A recent article in the *Lancet* reported that, during one month in 1975, 648 tourists backpacked for several days along a high, narrow trail to reach the Nepalese village of Pheriche at 14,000 feet.⁴ Their goal was a 17,700-foot point, two days further on, where they could view Mt. Everest. The tourist industry has found an area for expansion by sponsoring such high-altitude treks. Mountaineering clubs, which sponsor treks and expeditions to the high areas of the world, exist in almost every American city, and their membership rolls are teeming. The spiraling increase in the number of flatland tourists who are joining the ranks of hikers, trekkers, skiers and mountaineers seeking adventure at high elevations has raised acute mountain sickness from a curiosity to a major medical concern.

It is possible that half of the individuals who undertake these adventures will succumb to acute mountain sickness.⁴ More than 2% will develop high altitude pulmonary oedema or cerebral oedema, and some of these will die.³⁻⁵ Acute mountain sickness is therefore a concern for all physicians. Physicians themselves represent a goodly portion of the thousands who are heading for the high country, and those accompanying trekking groups in the mountains have often shown themselves to be totally and tragically ignorant of the ailment and its consequences.⁴ The less adventurous physicians who never leave the flat land will find their patients inquiring about preventing and/or treating acute mountain sickness.

The mildest form of the disease is a combination of trivial symptoms—headache, dizziness, nausea, loss of appetite, sleeplessness or giddiness. The headache can usually be controlled with aspirin or codeine, and the condition is usually gone in four to eight days.^{1-2,4}

More serious symptoms include headache not relieved by aspirin or codeine, vomiting, chest discomfort with shortness of breath, malaise and lassitude, ataxia, tachycardia and oliguria.^{1,3-4}

In its severe and potentially fatal forms, acute mountain sickness develops into pulmonary oedema or cerebral oedema. Pulmonary oedema is indicated by rapid onset tachypnoea, hypotension, cyanosis at rest, rales, tachycardia and mild fever.³⁻⁴ Cerebral oedema is characterized by incapacitating headache, gross ataxia, disorientation and hallucinations, paralysis and usually by papilloedema and coma.⁴ Recovery from both severe forms of acute mountain sickness is rapid upon descent to lower elevations.³

Acute mountain sickness can occur in any healthy individual who rapidly travels from a low area to an elevation above 9,000 feet.⁶ The disease cannot be predicted.³ It does not appear to be related to the victim's physical condition, sex, previous altitude experience or to the load being carried.⁴ It can be closely correlated to speed of ascent and overexertion.⁴ In general, the higher, faster and harder one ascends, the more likely he is to develop acute mountain sickness.³ Incidence increases in the young.⁴ Severity is inversely related to age and to the highest altitude previously attained.⁴

THE AUTHOR AND COVER PHOTOGRAPHER, JOSEPH JENSEN signing the register on Little Bear Peak (14,037 ft.) in Southern Colorado. Mt. Blanca (14,317 ft.) is in the background. Over the last decade, Mr. Jensen has climbed 107 peaks over 14,000 ft. high. (Photography by Leonard Ellis.)

The mechanisms behind acute mountain sickness remain obscure. Hypoxia is almost certainly the beginning phase. Antidiuresis usually occurs prior to the onset of other symptoms.²

The best summary of current understanding of the condition appeared in a recent editorial in *Lancet*.³ Acute mountain sickness could be the result of brain cell compression. Sometimes an increase in cerebrospinal pressure accompanies it. In cerebral oedema, increased membrane permeability caused by hypoxia brings on severe oedema, increasing intercranial pressure, which shuts off the blood flow. High-altitude pulmonary oedema may be a form of neurogenic pulmonary oedema. A massive, central, sympathetic discharge shifts blood from the systemic to the pulmonary circulation, causing pulmonary hypertension, lung hemorrhage, increased capillary permeability, malperfusion and maldistribution of ventilation.

Treatment of the commoner, less severe forms of acute mountain sickness consists of aspirin or codeine for headache, sleeping pills for insomnia and slowing the rate of ascent. Stopping the trek for a day or more to acclimatize is usually helpful. The majority of those afflicted with the sickness will be able to continue later.⁴ It is essential, however, to keep in mind that the severe and potentially fatal forms of this disease progress rapidly and with very little warning. High-altitude pulmonary oedema and cerebral oedema can arise in and kill a person within a matter of hours.⁴ Immediate descent is the only effective treatment and is called for with anyone who experiences severe, constant and uncontrollable headache, uncharacteristic weakness or fatigue or who develops a dry cough, cyanosis or rales or becomes ataxic or confused.³⁻⁵

If oxygen is available, it should be administered. Morphine may help divert blood back to the systemic circulation.³ Frusemide may be helpful in treating established pulmonary oedema,² although its effectiveness has not been proven in controlled studies.³ Betamethasone has been used to treat cerebral oedema;² however, delaying descent to send for help, oxygen or drugs is usually futile; in no circumstance should descent be delayed.

The more severe forms of acute mountain sickness are especially deceptive. The confusion that is symptomatic of pulmonary oedema or cerebral oedema will often prevent the victim from being aware of the onset of serious complications, and he will insist that he is well and capable of proceeding. It is therefore essential that all individuals going to high altitudes be familiar with the dangers and symptoms of acute mountain sickness and its complications so as to watch for their development in their companions. Fatalities result from not diagnosing symptoms early enough and not forcing ailing individuals to descend.³ If descent is begun early enough, most victims recover after descending 3,000 feet, or at least to 10,000 feet.¹

Chemical prophylaxis of acute mountain sickness is a topic of much debate in the correspondence columns of several journals. Accounts are generally anecdotal, and to date there has been no controlled study that demonstrates the effectiveness of a drug in preventing this sickness.

The two drugs currently debated are acetazolamide and spironolactone. Acetazolamide causes a slight diuresis and relative metabolic acidosis. It is also thought to temporarily reduce cerebrospinal fluid production in some people.³ In 1975, Hackett, Renee and Lavine⁴ studied the effect of acetazolamide in preventing acute mountain sickness in 278 individuals trekking to the Mt. Everest base camp in Nepal. Those persons who volunteered to take part in the study used either acetazolamide or a placebo, administered in a double-blind fashion. Those who did not volunteer were used as controls. The authors concluded from this study that acetazolamide ameliorates acute mountain sickness and is a useful prophylactic, especially in individuals who fly directly to high elevations.

The validity of this conclusion has been challenged because of the statistical methods used.⁹ It is also suggested that administration of acetazolamide could be detrimental by causing potassium depletion. The combination of physical exercise and potassium depletion in an individual may cause acute rhabdomyolysis and lead to renal failure. Without determining why, the study by Hackett and his companions does suggest that

administration of acetazolamide under certain conditions may do more harm than good.

The other drug currently in vogue as prophylaxis for acute mountain sickness is spironolactone. The evidence for the effectiveness of this drug is so far entirely anecdotal. The first report¹ of its possible effectiveness was based upon a self-experiment conducted by Currie and 10 companions (seven of whom were physicians) in two trips to Nepal. The dosage was 25 mg., three times a day, for two days preceding and during periods spent at elevations above 10,000 feet. The theoretical basis for the use of spironolactone is that it counteracts the positive aldosterone response to adaptive plasma volume depletion at altitude. Spironolactone does not cause potassium depletion, as does acetazolamide.⁷ Among Currie and his companions, no acute mountain sickness occurred in those individuals taking spironolactone.

McFarlane⁸ attacked Currie's use of spironolactone as theoretically unsound and suggests that its use may be antitherapeutic. He cites a study showing that those who suffer the most severe symptoms of acute mountain sickness show the greatest decrease in aldosterone excretion, and, accordingly, the administration of spironolactone may accentuate this phenomenon. A later article by Currie⁹ refutes McFarlane's contentions, mainly by citing other studies of aldosterone excretion in acute mountain sickness that reflect contradictory results.

Two additional accounts of successful use of spironolactone to prevent acute mountain sickness have since appeared in the literature. Both are anecdotal and involve small groups. Fifteen individuals on a trip to the Mt. Everest base camp from Dec. 13, 1976-Jan. 16, 1977, began taking the drug eight hours before their flight to the starting point. All successfully reached the base camp at 18,000 feet. Of the 15, only three could have been regarded as showing evidence of even slight acute mountain sickness.¹⁰

Another report involved 12 non-acclimatized Europeans climbing 19,000-foot Kilimanjaro in Tanzania in 1976. These attempted a double-blind trial of spironolactone. All members took either 25 mg. of spironolactone or a placebo tablet three times a day for 48 hours before reaching 10,000 feet. Of the six on spironolactone, two developed acute mountain sickness, while five of the six on the placebo developed the disease.¹¹

The question of chemical prophylaxis for acute mountain sickness obviously remains open. Each report ends with a statement that the small number of subjects, or the reporting or investigating methods, made the results inconclusive, and each report calls for a controlled clinical trial of the effectiveness of both drugs.

Almost all studies and reports, however, confirm the prophylactic measures long known and used by experienced mountaineers and guides. These essentially require time adaptation to altitude.^{1,4,9,12} The technique is easily described—ascend slowly. Climb high, but spend nights down low to acclimatize.³⁻⁴ Above 7,000 feet it is best to limit the rate of ascent to 1,500 feet per day. Above 10,000 feet, the rate should be slowed to 1,000 feet per day.^{4,9}

Hackett's study⁴ effectively demonstrates the value of these measures. The 52% of his subjects who developed the sickness were those who ascended most rapidly and spent the fewest days in reaching their goals. This study also confirmed that slow ascent reduces both the incidence and severity of acute mountain sickness, high altitude pulmonary oedema and cerebral oedema, but to do *anything* slowly and leisurely is not consistent with our times. More and more individuals will fly to high elevations such as Lukla at 9,000 feet to begin a trek to a higher goal, like the base camp of Everest. Tourist agencies and outfitters will promote short trips like this, despite evidence that longer, slower approaches from lower elevations confer substantial protection from acute mountain sickness.

Two British physicians in the successful British Everest expedition in 1975 were alarmed upon their descent from the mountain to find 100 trekkers planning to do the last stages of the approach to the base camp in less than half the time the expedition team had taken earlier.¹²

As technology and economic well-being continue to improve access to higher elevations of the world, increasing numbers of individuals will climb too high and too fast, and the consequences will provide statistics for medical journal articles.

A reminder

ZYLOPRIM[®]

(allopurinol)

100 and 300 mg scored Tablets

- inhibits uric acid formation
- helps prevent urate crystal depositions in synovia
- reduces risk of uric acid lithiasis

INDICATIONS AND USE: This is not an innocuous drug and strict attention should be given to the indications for its use. Pending further investigation, its use in other hyperuricemic states is not indicated at this time.

Zyloprim[®] (allopurinol) is intended for:

1. treatment of gout, either primary, or secondary to the hyperuricemia associated with blood dyscrasias and their therapy;
2. treatment of primary or secondary uric acid nephropathy, with or without accompanying symptoms of gout;
3. treatment of patients with recurrent uric acid stone formation;
4. prophylactic treatment to prevent tissue urate deposition, renal calculi, or uric acid nephropathy in patients with leukemias, lymphomas and malignancies who are receiving cancer chemotherapy with its resultant elevating effect on serum uric acid levels.

CONTRAINDICATIONS: Use in children with the exception of those with hyperuricemia secondary to malignancy. The drug should not be employed in nursing mothers.

Patients who have developed a severe reaction to Zyloprim should not be restarted on the drug.

WARNINGS: ZYLOPRIM SHOULD BE DISCONTINUED AT THE FIRST APPEARANCE OF SKIN RASH OR ANY SIGN OF ADVERSE REACTION. In some instances a skin rash may be followed by more severe hypersensitivity reactions such as exfoliative, urticarial and purpuric lesions as well as Stevens-Johnson syndrome (erythema multiforme) and very rarely a generalized vasculitis which may lead to irreversible hepatotoxicity and death.

A few cases of reversible clinical hepatotoxicity have been noted and in some patients asymptomatic rises in serum alkaline phosphatase or serum transaminase have been observed. Accordingly, periodic liver function tests should be performed during the early stages of therapy, particularly in patients with pre-existing liver disease. Patients should be alerted to the need for due precautions when engaging in activities where alertness is mandatory.

Nevertheless, iron salts should not be given simultaneously with Zyloprim. This drug should not be administered to immediate relatives of patients with idiopathic hemochromatosis.

In patients receiving Purlinethol[®] (mercaptapurine) or Imuran[®] (azathioprine), the concomitant administration of 300-600 mg of Zyloprim per day will require a reduction in dose to approximately one-third to one-fourth of the usual dose of mercaptapurine or azathioprine. Subsequent adjustment of doses of Purlinethol or Imuran should be made on the basis of therapeutic response and any toxic effects.

Usage in Pregnancy and Women of Childbearing Age: Zyloprim[®] (allopurinol) should be used in pregnant women or women of childbearing age only if the potential benefits to the patient are weighed against the possible risk to the fetus.

PRECAUTIONS: Some investigators have reported an increase in acute attacks of gout during the early stages of allopurinol administration, even when normal or sub-normal serum uric acid levels have been attained.

It has been reported that allopurinol prolongs the half-life of the anticoagulant, dicumarol. This interaction should be kept in mind when allopurinol is given to patients already on anticoagulant therapy, and the coagulation time should be reassessed.

A fluid intake sufficient to yield a daily urinary output of at least 2 liters and the maintenance of a neutral or, preferably, slightly alkaline urine are desirable to (1) avoid the theoretic possibility of formation of xanthine calculi under the influence of Zyloprim therapy and (2) help prevent renal precipitation of urates in patients receiving concomitant uricosuric agents.

Patients with impaired renal function require less drug and should be carefully observed during the early stages of Zyloprim administration and the drug withdrawn if increased abnormalities in renal function appear.

In patients with severely impaired renal function, or decreased urate clearance, the half-life of oxipurinol in the plasma is greatly prolonged. Therefore, a dose of 100 mg per day or 300 mg twice a week, or perhaps less, may be sufficient to maintain adequate xanthine oxidase inhibition to reduce serum urate levels. Such patients should be treated with the lowest effective dose, in order to minimize side effects.

Mild reticulocytosis has appeared in some patients.

As with all new agents, periodic determination of liver and kidney function and complete blood counts should be performed especially during the first few months of therapy.

ADVERSE REACTIONS:

Dermatologic: Because in some instances skin rash has been followed by severe hypersensitivity reactions, it is recommended that therapy be discontinued at the first sign of rash or other adverse reaction (see WARNINGS). Skin rash, usually maculopapular, is the adverse reaction most commonly reported.

Exfoliative, urticarial and purpuric lesions, Stevens-Johnson syndrome (erythema multiforme) and toxic epidermal necrolysis have also been reported.

A few cases of alopecia with and without accompanying dermatitis have been reported.

In some patients with a rash, restarting Zyloprim (allopurinol) therapy at lower doses has been accomplished without untoward incident.

Gastrointestinal: Nausea, vomiting, diarrhea, and intermittent abdominal pain have been reported.

Vascular: There have been rare instances of a generalized hypersensitivity vasculitis or necrotizing angitis which have led to irreversible hepatotoxicity and death.

Hematopoietic: Agranulocytosis, anemia, aplastic anemia, bone marrow depression, leukopenia, pancytopenia and thrombocytopenia have been reported in patients, most of whom received concomitant drugs with potential for causing these reactions. Zyloprim[®] (allopurinol) has been neither implicated nor excluded as a cause of these reactions.

Neurologic: There have been a few reports of peripheral neuritis occurring while patients were taking Zyloprim. Drowsiness has also been reported in a few patients.

Ophthalmic: There have been a few reports of cataracts found in patients receiving Zyloprim. It is not known if the cataracts predated the Zyloprim therapy. "Toxic" cataracts were reported in one patient who also received an anti-inflammatory agent; again, the time of onset is unknown. In a group of patients followed by Gutman and Yü for up to five years on Zyloprim therapy, no evidence of ophthalmologic effect attributable to Zyloprim was reported.

Drug Idiosyncrasy: Symptoms suggestive of drug idiosyncrasy have been reported in a few patients. This was characterized by fever, chills, leukopenia or leukocytosis, eosinophilia, arthralgias, skin rash, pruritus, nausea and vomiting.

OVERDOSAGE: Massive overdosing, or acute poisoning, by Zyloprim has not been reported.

HOW SUPPLIED: 100 mg (white) scored tablets, bottles of 100 and 1000; 300 mg (peach) scored tablets, bottles of 30, 100 and 500. Unit dose packs for each strength also available.

Doctors in the News

Artwork Awarded

Sue Seif, a student in the Johns Hopkins School of Medicine's Department of Art as Applied to Medicine, and Dr. A. Lee Dellon, Resident in Plastic Surgery at Hopkins Hospital, have been awarded first prize by the American Cleft Palate Educational Foundation for their essay on auditory tube function.

The cash awards and plaques were awarded at the Third International Cleft Palate Congress in Toronto recently.

Based on Ms. Seif's research for her Master's Degree in medical and biological illustration, the essay describes the anatomy and relationships of the auditory tube and surrounding structures. A model for auditory tube function is presented which answers several previously-debated questions of

clinical significance in cleft palate repair.

Ms. Seif, a native of Baltimore, is a graduate of Goucher College and was Assistant to the Director of Public Relations at Johns Hopkins for several years before entering graduate school. A Teaching Assistant in Gross Anatomy at the medical school, she received her Master's Degree.

Dr. Dellon earned both his Bachelor's and Medical Degrees at Hopkins. He is Chief Resident in Plastic Surgery at Hopkins. □

Tenuate®
(diethylpropion hydrochloride NF)

Tenuate Dospan®
(diethylpropion hydrochloride NF) controlled-release

AVAILABLE ONLY ON PRESCRIPTION

Brief Summary

INDICATION: Tenuate and Tenuate Dospan are indicated in the management of exogenous obesity as a short-term adjunct (a few weeks) in a regimen of weight reduction based on caloric restriction. The limited usefulness of agents of this class should be measured against possible risk factors inherent in their use such as those described below.

CONTRAINDICATIONS: Advanced arteriosclerosis, hyperthyroidism, known hypersensitivity, or idiosyncrasy to the sympathomimetic amines, glaucoma. Agitated states. Patients with a history of drug abuse. During or within 14 days following the administration of monoamine oxidase inhibitors, (hypertensive crises may result).

WARNINGS: If tolerance develops, the recommended dose should not be exceeded in an attempt to increase the effect; rather, the drug should be discontinued. Tenuate may impair the ability of the patient to engage in potentially hazardous activities such as operating machinery or driving a motor vehicle; the patient should therefore be cautioned accordingly. **Drug Dependence:** Tenuate has some chemical and pharmacologic similarities to the amphetamines and other related stimulant drugs that have been extensively abused. There have been reports of subjects becoming psychologically dependent on diethylpropion. The possibility of abuse should be kept in mind when evaluating the desirability of including a drug as part of a weight reduction program. Abuse of amphetamines and related drugs may be associated with varying degrees of psychological dependence and social dysfunction which, in the case of certain drugs, may be severe. There are reports of patients who have increased the dosage to many times that recommended. Abrupt cessation following prolonged high dosage administration results in extreme fatigue and mental depression; changes are also noted on the sleep EEG. Manifestations of chronic intoxication with anorectic drugs include severe dermatoses, marked insomnia, irritability, hyperactivity, and personality changes. The most severe manifestation of chronic intoxications is psychosis, often clinically indistinguishable from schizophrenia. **Use in Pregnancy:** Although rat and human reproductive studies have not indicated adverse effects, the use of Tenuate by women who are pregnant or may become pregnant requires that the potential benefits be weighed against the potential risks. **Use in Children:** Tenuate is not recommended for use in children under 12 years of age.

PRECAUTIONS: Caution is to be exercised in prescribing Tenuate for patients with hypertension or with symptomatic cardiovascular disease, including arrhythmias. Tenuate should not be administered to patients with severe hypertension. Insulin requirements in diabetes mellitus may be altered in association with the use of Tenuate and the concomitant dietary regimen. Tenuate may decrease the hypotensive effect of guanethidine. The least amount feasible should be prescribed or dispensed at one time in order to minimize the possibility of overdose. Reports suggest that Tenuate may increase convulsions in some epileptics. Therefore, epileptics receiving Tenuate should be carefully monitored. Titration of dose or discontinuance of Tenuate may be necessary.

ADVERSE REACTIONS: **Cardiovascular:** Palpitation, tachycardia, elevation of blood pressure, precordial pain, arrhythmia. One published report described T-wave changes in the ECG of a healthy young male after ingestion of diethylpropion hydrochloride. **Central Nervous System:** Overstimulation, nervousness, restlessness, dizziness, jitteriness, insomnia, anxiety, euphoria, depression, dysphoria, tremor, dyskinesia, mydriasis, drowsiness, malaise, headache; rarely psychotic episodes at recommended doses. In a few epileptics an increase in convulsive episodes has been reported. **Gastrointestinal:** Dryness of the mouth, unpleasant taste, nausea, vomiting, abdominal discomfort, diarrhea, constipation, other gastrointestinal disturbances. **Allergic:** Urticaria, rash, ecchymosis, erythema. **Endocrine:** Impotence, changes in libido, gynecomastia, menstrual upset. **Hematopoietic System:** Bone marrow depression, agranulocytosis, leukopenia. **Miscellaneous:** A variety of miscellaneous adverse reactions has been reported by physicians. These include complaints such as dyspnea, hair loss, muscle pain, dysuria, increased sweating, and polyuria.

DOSAGE AND ADMINISTRATION: Tenuate (diethylpropion hydrochloride): One 25 mg. tablet three times daily, one hour before meals, and in mid-evening if desired to overcome night hunger. Tenuate Dospan (diethylpropion hydrochloride) controlled-release: One 75 mg. tablet daily, swallowed whole, in mid-morning. Tenuate is not recommended for use in children under 12 years of age.

OVERDOSEAGE: Manifestations of acute overdose include restlessness, tremor, hyperreflexia, rapid respiration, confusion, assaultiveness, hallucinations, panic states. Fatigue and depression usually follow the central stimulation. Cardiovascular effects include arrhythmias, hypertension or hypotension and circulatory collapse. Gastrointestinal symptoms include nausea, vomiting, diarrhea, and abdominal cramps. Overdose of pharmacologically similar compounds has resulted in fatal poisoning, usually terminating in convulsions and coma. Management of acute Tenuate intoxication is largely symptomatic and includes lavage and sedation with a barbiturate. Experience with hemodialysis or peritoneal dialysis is inadequate to permit recommendation in this regard. Intravenous phentolamine (Regitine®) has been suggested on pharmacologic grounds for possible acute, severe hypertension, if this complicates Tenuate overdose.

Product Information as of April, 1976

Merrell

8-3921 (1587A)

**Whether overweight is a
complicating factor...
or just uncomplicated overweight.**

Tenuate[®] Dospan[®] ^{IV} **(diethylpropion hydrochloride NF)** **75 mg. controlled-release tablets**

A useful short-term adjunct in an indicated weight loss program.

Overweight patients in certain diagnostic categories often require strict obesity control. Diethylpropion hydrochloride has been reported useful in obese patients with hypertension, symptomatic cardiovascular disease, or diabetes. While it is not suggested that Tenuate in any way reduces these complications in the overweight, it may have a useful place as a short-term adjunct in a prescribed dietary regimen. (Tenuate should not be administered to patients with severe hypertension; see additional Warnings and Precautions on the opposite page.)

In uncomplicated obesity.

Many patients, on the other hand, present with excess fat but no disease. While this condition is often termed uncomplicated obesity, complications of both a social and a psychologic nature may be distressingly real for the patients. In these cases, a short-term regimen of Tenuate can help reinforce your dietary counsel during the important early weeks of an indicated weight loss program.

Clinical effectiveness.

The anorexic effectiveness of diethylpropion hydrochloride is well documented. No less than 16 separate double-blind, placebo-controlled studies attest to its usefulness in daily practice.¹ And the unique chemistry of Tenuate provides "...anorexic potency with minimal overt central nervous system or cardiovascular stimulation."² Compared with the amphetamines, diethylpropion has minimal potential for abuse.

**Tenuate—it makes sense.
And it's responsible medicine.**

Merrell

For prescribing information see opposite page.

The evidence of experience

Since October 1974 when Motrin® (ibuprofen) was introduced in the United States, it has been used by more than 6,000,000 patients with rheumatoid arthritis* or osteoarthritis. Rarely has an ethical pharmaceutical product been prescribed for so many patients in so short a time. In addition, more than 450 studies presenting new data related to Motrin have been published.

The 6,000,000 patients already treated with Motrin is an objective measure of physicians' confidence in the ability of Motrin to relieve the pain and inflammation associated with rheumatoid arthritis and osteoarthritis.

So it is not surprising that in this short period Motrin has become the most frequently prescribed alternative to aspirin. Motrin relieves joint pain and inflammation as effectively as indomethacin or aspirin, but causes significantly fewer CNS and milder GI reactions.

However, gastrointestinal bleeding, sometimes severe, has been associated with Motrin, aspirin, indomethacin, and other nonsteroidal antiarthritic agents.

*The safety and effectiveness of Motrin have not been established in patients with Functional Class IV rheumatoid arthritis (incapacitated, largely or wholly bedridden, or confined to wheelchair; little or no self-care).

Motrin[®] 400 mg TABLETS ibuprofen, Upjohn

The confidence that comes from experience—

Upjohn

The Upjohn Company, Kalamazoo, Michigan 49001

J-6857-4

The confidence that comes from experience—
one more reason to prescribe

Motrin[®] 400 mg TABLETS

ibuprofen, Upjohn

Indications and Usage: Treatment of signs and symptoms of rheumatoid arthritis and osteoarthritis during acute flares and in long-term management. Safety and efficacy have not been established in Functional Class IV rheumatoid arthritis.

Contraindications: Individuals hypersensitive to it, or with the syndrome of nasal polyps, angioedema and bronchospastic reactivity to aspirin or other nonsteroidal anti-inflammatory agents (see WARNINGS).

Warnings: Anaphylactoid reactions have occurred in patients with aspirin hypersensitivity (see CONTRAINDICATIONS).

Peptic ulceration and gastrointestinal bleeding, sometimes severe, have been reported. Ulceration, perforation, and bleeding may end fatally. An association has not been established. Motrin should be given under close supervision to patients with a history of upper gastrointestinal tract disease, only after consulting ADVERSE REACTIONS.

In patients with active peptic ulcer and active rheumatoid arthritis, nonulcerogenic drugs, such as gold, should be tried. If Motrin must be given, the patient should be under close supervision for signs of ulcer perforation or gastrointestinal bleeding.

Precautions: Blurred and/or diminished vision, scotomata, and/or changes in color vision have been reported. If these develop, discontinue Motrin and the patient should have an ophthalmologic examination, including central visual fields.

Fluid retention and edema have been associated with Motrin; use with caution in patients with a history of cardiac decompensation.

Motrin can inhibit platelet aggregation and prolong bleeding time. Use with caution in persons with intrinsic coagulation defects and those on anticoagulant therapy.

Patients should report signs or symptoms of gastrointestinal ulceration or bleeding, blurred vision or other eye symptoms, skin rash, weight gain, or edema.

To avoid exacerbation of disease or adrenal insufficiency, patients on prolonged corticosteroid therapy should have therapy tapered slowly when Motrin is added.

Drug interactions. Aspirin used concomitantly may decrease Motrin blood levels. Coumarin: Bleeding has been reported in patients taking Motrin and coumarin.

Pregnancy and nursing mothers: Motrin should not be taken during pregnancy or by nursing mothers.

Adverse Reactions

Incidence greater than 1%

Gastrointestinal: The most frequent type of adverse reaction occurring with Motrin (ibuprofen) is gastrointestinal (4% to 16%). This includes nausea*, epigastric pain*, heartburn*, diarrhea, abdominal distress, nausea and vomiting, indigestion, constipation, abdominal cramps or pain, fullness of the GI tract (bloating and flatulence). **Central Nervous System:** Dizziness*, headache, nervousness. **Dermatologic:** Rash* (including maculopapular type), pruritus. **Special Senses:** Tinnitus. **Metabolic:** Decreased appetite, edema, fluid retention. Fluid retention generally responds promptly to drug discontinuation (see PRECAUTIONS).

Incidence: Unmarked 1% to 3%; *3% to 9%.

Incidence less than 1 in 100

Gastrointestinal: Upper GI ulcer with bleeding and/or perforation, hemorrhage, melena. **Central Nervous System:** Depression, insomnia. **Dermatologic:** Vesiculobullous eruptions, urticaria, erythema multiforme. **Cardiovascular:** Congestive heart failure in patients with marginal cardiac function, elevated blood pressure. **Special Senses:** Amblyopia (see PRECAUTIONS). **Hematologic:** Leukopenia, decreased hemoglobin and hematocrit.

Causal relationship unknown

Gastrointestinal: Hepatitis, jaundice, abnormal liver function. **Central Nervous System:** Paresthesias, hallucinations, dream abnormalities. **Dermatologic:** Alopecia, Stevens-Johnson syndrome. **Special Senses:** Conjunctivitis, diplopia, optic neuritis. **Hematologic:** Hemolytic anemia, thrombocytopenia, granulocytopenia, bleeding episodes. **Allergic:** Fever, serum sickness, lupus erythematosus syndrome. **Endocrine:** Gynecomastia, hypoglycemia. **Cardiovascular:** Arrhythmias. **Renal:** Decreased creatinine clearance, polyuria, azotemia.

Overdosage: In cases of acute overdosage, the stomach should be emptied. The drug is acidic and excreted in the urine, so alkaline diuresis may be beneficial.

Dosage and Administration: Suggested dosage is 300 or 400 mg t.i.d. or q.i.d. Do not exceed 2400 mg per day.

Routine Screening for Hemoglobinopathy in Blacks

By JOSEPH M. MILLER, MD and DEBORAH C. DAVIS, BS

Dr. Miller and Ms. Davis can be contacted for reprint and other data at Provident Hosp., Inc., 2600 Liberty Heights Ave., Balto., MD 21215, where Dr. Miller is Director of Continuing Medical Education.

The hemoglobinopathies constitute a major health problem in blacks who comprise a sizable portion of the Baltimore population. Screening by hemoglobin electrophoresis and solubility tests have demonstrated an incidence of 10.98% in 64,711 individuals investigated.

Percentages obtained from the Sick Cell Screening Clinic and inpatient screening were the same. Some cross-over surely occurred in this investigation, as the Hospital is situated in an area serving 204,734 blacks in 39 census tracts (1970). In the Screening Clinic, the percentage of hemoglobinopathy was 10.97 (4,336/39,510), while inpatients showed a percentage of 10.98 (2,770/25,201). These numbers testify to the natural observation that the Hospital derives its clientele from the surrounding area.

The sickle cell trait frequency in the Screening Clinic was 7.85%, while the group in the hospital comprised 7.86%. Sickle Cell trait is thus not found in Hospital patients to a greater degree than exists in individuals in the community, and apparently is not associated with some forms of morbidity which would make it more likely for that individual to show up in a hospital population.

The 10.97% rate does suggest, however, that if one out of every 10 black individuals admitted to a hospital for some reason has a hemoglobinopathy, then a hem-

oglobin screening should be done on all such patients. The risk of missing a hemoglobin variant which may influence the clinical course of the patient is more than the physician should be willing to assume.

The clinical objection that individuals with sickle cell trait usually have a benign and unimpaired life-span may not be entirely true. Hyposthenuria, hematuria and renal infarction are fairly well-documented in this hemoglobinopathy. Splenic and pulmonary infarction may occur under conditions of low oxygen tension or in shock. Pyelonephritis and urinary tract infection are other complications. Because of the risk of hypoxia during surgery, the presence of the trait should be known to the operating team.

The best procedure to discover the hemoglobinopathies is to do a hemoglobin electrophoresis. A solubility test with sodium dithionite is performed in those patients with hemoglobin migrating in the sickle cell band. If a hemoglobin C were demonstrated, a citrate agar electrophoresis was done to determine whether or not hemoglobins C, E or O were present. Further delineation of the C band was accomplished by a solubility test to differentiate between hemoglobins C and C Harlem.

The routine practice of medicine and surgery involving black patients should include a hemoglobin screening when the patient enters the hospital. Because the test can be easily done, it should be included among initial laboratory procedures. Information yielded to the physician under certain circumstances may be helpful in arriving at a diagnosis. ☐

The Physician's Role in Narcotic Abuse

By KENNARD L. YAFFE, MD
Chairman, Med-Chi Committee on Drugs

Following is a report of one day's hearings of the House Select Committee on Narcotics Abuse and Control, as published by the Pharmaceutical Manufacturers Association in its *Newsletter* of Sept. 25, 1978:

If the House Select Committee on Narcotics Abuse and Control thought that last Wednesday's witnesses—a journalist, a pharmacologist, a psychiatrist and an AMA trustee—could enlighten the Congress about "overprescribing" physicians, four hours of testimony proved otherwise.

"I will begin by stating my bias, and that is I believe we live in an overmedicated society," journalist John Pekkanen (author of *The American Connection*) began. "My area of special concern has long been legitimately-prescribed psychoactive drugs." The rest of his testimony and answers did not live up to the Committee's expectations. True, he said that the drug companies "court" the doctors, but, he continued, "The problem is extremely complex. Everybody I talked to is very concerned . . . It's very difficult to determine precisely who needs psychoactive drugs . . . The symptoms are vague;" and, he stressed, "Never underestimate patient demands."

Next came Dr. T. Donald Rucker, Chairman of the Ohio State University Pharmacology Department, who bemoaned the lack of an adequate data base in 23 pages of testimony and tables.

The two American Medical Association witnesses, Daniel X. Freedman, University of Chicago Psychiatry Department Chairman and Joseph Boyle, Los Angeles internist and AMA trustee, warned about the complexity of easy accusations. "We do not believe that statistics regarding the total annual number of prescriptions written for a particular drug can really answer questions pertinent to whether there is overprescribing or misprescribing of that drug," Dr. Boyle said. "Higher than expected use of these drugs could also be attributed to increased access to health care now available under Federal programs such as Medicare and Medicaid or to the trend in treating mental illness in the community rather than in institutions. A greater willingness among some groups to seek help can lead to increased uses of these drugs in certain populations. In any event, it must be remembered that conditions such as anxiety are often attributable to factors beyond the control of medicine, such as inflation, unemployment, family relationships and shifting social values."

They explained what the AMA has done to assure wise prescribing:

- The AMA's Drug Evaluations, published in cooperation with the American Society of Clinical Pharmacology and Therapeutics, Dr. Boyle said, "is designed to provide practicing physicians with an up-to-date, unbiased, scientific evaluation of available drugs." The section on psychotropic substances warns the physician to guard against "contributing to drug abuse through injudicious prescription practices or by acquiescence to the demands of some patients for instant chemical answers to their problems."

- "When it can be established that a physician or other prescriber is prescribing or dispensing drugs for non-medical use, appropriate actions should be taken to halt such activity. We support strict enforcement of the law."

- "The AMA has been especially active in working to improve medical discipline at the state level. We have developed model state legislation on the subject of physician discipline."

- "The AMA supports efforts designed to eliminate improper prescribing, and we believe the principal means for achieving such a result is to provide unbiased, valid and current information to physicians on the risks and benefits of particular drugs in various treatment situations."

- "The AMA Archives of General Psychiatry over the past decade has published major controlled studies relating to the efficacy and side effects of psychotropic drugs. In addition, major

national surveys of prescription drug use have also been published in order to more reliably inform physicians concerning drug use."

That's not enough, the Committee indicated.

Paul Rogers (D, FL): "What's the AMA doing for leadership?"

Boyle: "We have a committee on substance abuse to advise the states."

Rogers: "Don't you think you should establish a staff to investigate?"

Boyle: "Our function is to advise. We have no authority, we're not a regulatory agency; we can't go into the physician's office."

Lester Wolff (D, NY): "Are there no AMA standards?"

"You have not assumed real leadership," Rogers told the AMA witnesses. "I want a letter from the AMA, telling us what it can and will do in regard to improper overprescribing."

The Faculty's Committee on Drugs faces this kind of problem continuously, and so asked our Executive Director to let the House Select Committee on Narcotics Abuse and Control know that Maryland is not sitting back, waiting for someone else to solve this problem. John Sargeant wrote the following letter:

"The Hon. Lester L. Wolff, Chairman
House Select Committee on Narcotics Abuse and Control
Rayburn House Office Building
Wash., DC 20515

Dear Mr. Wolff:

We have read a "thumb-nail" report of the testimony before your committee by witnesses from the AMA, among others, concerning overprescribing physicians. We are distressed that this article leaves one with the impression that the medical profession doesn't care very much about the problem of over- or mis-prescribing by physicians. Exactly the contrary is true. We believe the problem to be that the wrong people were on the carpet! While it is true the AMA cannot go into physicians's offices, the county and state medical societies can—and we do.

While we cannot speak for other states, of course, we believe that Maryland is fairly typical of other state societies in attempting to keep a handle on the prescribing practices of physicians and to take appropriate action when there is evidence of deviation from the accepted norms of practice. Maryland is one of a handful of states that has promulgated regulations restricting the prescribing of amphetamines. These regulations are presently being revised by the State Department of Health and Mental Hygiene with the advice and cooperation of the Medical and Chirurgical Faculty. Cooperation with the Department and the Faculty continues through pharmacy surveys being forwarded to the medical society for review. The physician is contacted if he is prescribing amphetamines and asked for an explanation of diagnosis, backed up by documentation for such prescribing. Prescribing of other classified drugs is also monitored and those physicians who cannot reasonably explain the use of such drugs are often referred for peer review of their entire practice. The next step, if the practice is found to be sub-normal, is referral to the Commission on Medical Discipline, a state agency.

We don't have all the answers, and perhaps there are a few physicians who slip by without being recognized as poor prescribers, but we believe this whole process to be educational in nature for physicians, and as protective of the public. We, too, support strict enforcement of the law, and cooperate with law enforcement authorities in identifying physicians who abuse the law.

We would be very happy to visit with your Committee, to describe our procedures in more detail and to answer any questions you might have. We have many physicians in Maryland who

freely give of their time and expertise to the problem of improper prescribing, and we are sure this is true in other states as well."

Now read the response from the Chief Counsel of the Select Committee. While his response was possibly not as enthusiastic as we would have liked about the efforts Maryland and some other states are making, we have been able to get on record as a state taking the initiative in acting responsibly to alleviate a perceived problem.

"Your letter to Chairman Wolff of Oct. 3 has been referred to me for reply.

The Select Committee on Narcotics Abuse and Control appreciates your expression of concern. We realize that there are many segments of the medical profession who are concerned and do monitor physician prescribing practices. Your restriction on the prescribing of amphetamines is a major step towards controlling their indiscriminate use. Estimates by the National Institute on Drug Abuse indicate, however, that 600 kilos of amphetamines, 60 million 10-milligram dosage units, are dispensed directly to the patient by the physician as part of the office visit without benefit of a prescription being filled in a drugstore. This 600 kilos represents 20-25% of the total amphetamines dispensed in the United States. The fact that Maryland may carefully regulate amphetamines while other states do not is just one example of the need to establish some basic uniformity between states with respect to dispensing scheduled drugs.

We are taking the liberty of including your letter in our hearing record and look forward to receiving a copy of the final regulations governing amphetamines after they are revised.

Once again, thank you for your interest and cooperation.

Sincerely,

Joseph L. Nellis
Chief Counsel"

This exchange of information might give some indication to members of Med-Chi of the extent of the abuse of amphetamines and the involvement of Maryland's doctors in an attempt to help control the abuse. ☐

Validity of the Zung Depression Scale (SDS) in Medical Outpatients

By DAVID RAFT, MD; ROBERT F. SPENCER, MD; TIMOTHY TOOMEY, PhD
and DONNA BROGAN, PhD

Drs. Raft, Spencer and Toomey are members of the Department of Psychiatry, while Dr. Brogan is affiliated with the Department of Biostatistics of the faculty of the University of North Carolina School of Medicine, North Carolina Memorial Hospital, Chapel Hill, NC 27514. Reprint requests should be directed to Dr. Raft, 315 South Wing, North Carolina Memorial Hospital.

Abstract

Sixty-nine randomly-selected medical outpatients were clinically evaluated for depressive disease. A Zung Self-Rating Depression Scale (SDS) was also administered to each patient. The prevalence of depression in the sample was 42%. While detecting 30% of those depressed, the SDS missed those whose depressive disease was presented under the guise of somatic illness. The SDS is thus a suitable instrument only in screening of the non-depressed medical patients.

Introduction

The prevalence of depression in general medical patients is verified in several studies,¹⁻⁴ yet detection of the depressed patient has remained a major problem of delivery of care. A brief, simpler self-administered questionnaire to identify the patients who suffer from depression has proven to be of considerable value. One such scale is the SDS. We examined its validity against clinical assessment of depression in a population of medical outpatients.

Description of the SDS

The scale is described elsewhere in detail.⁵⁻⁸ It consists of 20 items clinically judged to be discriminative of depression, i.e., lowering of mood, hopelessness, helplessness and biological concomitants of depression such as insomnia and lowered libido. The items are scored from 1-4, yielding a total score ranging from 20-80. This score is converted to a base of 100. Zung⁶ found that those scoring over 70 were generally depressed enough to require hospitalization.

Method

Roughly every fifth patient who presented to the Medical Screening Clinic of NCMH was selected. These patients came complaining of a variety of physical ailments. The population resembled one found in the general practitioner's office. Sixty-nine subjects were asked to complete the SDS. Each patient was then interviewed by one of the authors using a semistructured anamnestic method.

Clinical Classification of Patients

Depression was defined as a syndrome characterized by real or symbolic loss of object with hopelessness and helplessness, low mood or affect, vegetative signs (anorexia, insomnia, decreased libido) and loss of gratification and withdrawal from object relations. All tended to persist more than a month. Of the 29 patients diagnosed as suffering primary depression, 17 denied depression and claimed their sadness was due to physical symptoms. This "masked depression" subgroup showed many physiologic concomitants of depression, and medical investigation failed to uncover organic bases for their complaints.

Patients exhibiting overt thought disorder and excessive rigidity of defenses with extensive projection and denial were classified in the psychotic-borderline category even though they were depressed.

Results

Characteristics of the patients, distribution of the SDS scores and the demographic data are reported elsewhere.⁹ Patients were classified into five diagnostic categories—depression, borderline psychotic, conversion reaction, organic and normal—following psychiatric interview. Table I indicates characteristics for each of the diagnostic samples.

Table 1: Sample Characteristics Across Diagnostic Categories

Diagnosis(N)	Normal (16)	Depressed (29)	Conversion Reaction (10)	Psychosis-Border line (6)	Organic (8)
Mean Age	36.38	38.64	28.40	27.50	67.87
Age Range	18-52	17-64	17-49	21-40	50-85
Mean SDS Index	0.39	0.59	0.49	0.59	0.58
SDS Index Range	0.26-0.54	0.29-0.84	0.35-0.65	0.40-0.76	0.43-0.71
Standard Deviation	9.20/ /±4.60	9.77/ /±2.61	13.04/ /±4.12	16.17/ /±6.60	9.97/ /±3.53

Stepwise Discriminating Analysis

Tables 2 and 3 indicate characteristics which discriminate across diagnostic categories and between masked depression and depression. Considering all diagnostic categories, only three items in the Zung scale are of discriminative value, i.e., suicide, irritability and constipation. When the cases of masked depression are compared with the depressed cases, a single Zung item—sadness—is sufficient to classify 83% of the cases with no increase in discriminative power noted with the addition of other items.

Nine symptom categories (Table 4) were selected for comparison. Severity of symptoms as described by Beck¹⁰ was related clinically from 1-4 in a manner corresponding to the Zung rating. The mean response of the clinical rating was then compared to the mean response on the Zung scale (Figures 1 and 3). Figures 2 and 4 show comparative ratings of depression and

conversion reaction.

Discussion

Consideration of the clinical material presented indicates that the Zung scale does not differentiate between primary depression as defined here (and according to criteria set by Feighner, et al¹¹) and secondary depression, i.e., depression as a manifestation of a variety of physical and psychiatric illnesses. Nor does it separate depression from conversion reaction (Figure 4). While generally reliable, the Zung scale is not a good indicator of masked depression where the patient denies being depressed, although scrutiny reveals that depression underlies his/her various symptoms. This entity was discussed by Kennedy¹² and Bradley¹³ in the 1940s and more recently by Leese,¹⁴ Gallemore⁴ and Cohen.¹⁵

While correlation of clinical evaluation with the Zung SDS is good on overtly depressed patients (Figure 2), the differentiation of a patient suffering masked depression from one with conversion reaction can be determined only after a clinical interview (Figures 1

Table 2: Discriminant Analysis: All Diagnostic Categories

Step #		% Correctly Classified	df	F
1	Age	36%	(4, 64)	13.86**
2	SDS Index	49%	(4, 63)	9.94**
3	Zung item 19 (Suicide)	57%	(6, 62)	7.90**
4	Zung item 15 (Irritability)	59%	(7, 61)	6.74**
5	Zung item 8 (Constipation)	64%	(8, 60)	5.96**

**P < .01

Table 3: Discriminant Analysis: Masked Depression Vs. Depression

Step #		% Correctly Classified	df	F
1	Zung item 1 (Sadness)	83%	(1, 27)	18.22**
2	Zung item 3 (Crying Spells)	83%	(2, 26)	11.81**
3	Zung item 2 (Diurnal Mood)	79%	(3, 25)	8.61**
4	Zung item 6 (Sex)	83%	(4, 23)	7.22**
5	Zung item 13 (Agitation)	83%	(5, 23)	6.17**

**P < .01

CORRELATION OF CLINICAL AND ZUNG ITEMS

FIGURE 1

	I	II	III	IV	V	VI	VII	VIII	IX
Clinical Item	Mood/Affect	Appetite and Weight Loss	Insomnia Early and Late	Energy	Agitation	Sex and Interest	Guilt Anger Self-depreciate	Concentration	Suicide
Zung Item 0	1	5 and 7	4	10	13	6	15 and 17	11	19

FIGURE 2
CORRELATION OF CLINICAL
AND ZUNG ITEMS

and 2). Atypical or covert signs of depression manifesting in physical complaints may be an earlier indication of depression;¹⁶ however, Hegg reports that only half the depressed patients (N = 400) complained of low mood.¹⁷

FIGURE 3
CORRELATION OF CLINICAL
AND ZUNG ITEMS

A more sensitive scale than the Zung SDS seems necessary for patients whose primary complaints are somatic and who consult a general medical clinic rather than a psychiatric one.

At Manor Care we have you in mind, too.

When Manor Care coordinates medical services, we keep the physician as well as the patient in mind.

All seven of our Maryland centers offer:

- * A Registered Physical Therapist to carry out any therapy orders you prescribe.

- * A food service manager consulting with a Registered Dietician to provide any special diets your patient needs.

- * A unit dose medication system to ensure the freshness and accuracy of your prescriptions.

- * Extensive in-service education programs to keep the nursing staff up-to-date on new concepts and to review basic geriatric practices.

Nursing Bottle Syndrome

By SOL B. LOVE, DDS

For reprints and other data, write Dr. Love at 204 North Liberty St., Baltimore, MD 21201.

Summary

Nursing bottle syndrome or bottle caries is a form of rampant dental disease affecting the teeth of very young children who are allowed to fall asleep with a nursing bottle or breast in their mouths. The resultant tooth decay can affect the child's health status as well as result in premature loss of the deciduous teeth with results that can last a lifetime.

The physician is in an excellent position to educate the expectant and the new mothers in order to effectively prevent this potentially-destructive condition.

Background

Dental caries remains the most common oral pathology of the very young child. Pain, infection, speech difficulties, developmental and nutritional problems, as well as psychological problems, can be brought on by the rapid tooth decay and loss of primary teeth in nursing children. Commonly-referred to as nursing or baby bottle syndrome and bottle caries, this disease process, which has a definite pattern of distribution, can also occur in children who are breast-fed.

Since very few children are even taken to the dentist prior to age three, it is difficult for dentists to prevent this type of tooth decay. However, the physician has an excellent opportunity to diagnose and even prevent this disease from occurring.

Nursing bottle syndrome is a type of tooth decay seen in very young children who are allowed to fall asleep with a nursing bottle in their mouth. The bottle may contain milk, fruit juice, punch, honey or other carbohydrate containing fluid.

Etiology

The potential destructive effects of carbohydrates, especially the more highly-refined sugars, on teeth has been recognized for many years. Several microorgan-

isms normally present in the oral cavity metabolize carbohydrates and produce an acid as a waste product which demineralizes the tooth enamel. Demineralization of enamel is the first step in tooth decay.

When a child is put down for a nap or at bedtime with a nursing bottle in his mouth, the nipple rests against the palate and the tongue is in a forward position covering the lower incisors. As the child falls asleep, the swallowing slows and salivary flow decreases. This creates a pooling of the bottle's contents around all the teeth with the exception of the tongue-protected mandibular incisors. The carbohydrate material in the liquid thus remains in contact with the teeth for a prolonged period of time. All of the factors needed for the carious process to take place are now present, and the resultant effect can be seen in the photographs (see Figures 1 and 2.)

Signs and Symptoms

The decay process generally affects the upper incisors first, then the molars and cuspids (canines) and finally the lower incisors. The carious teeth have areas sometimes involving the entire clinical (visible) crown, and pathologic fracture of teeth is not unusual. The areas of decay may vary in color from light brown or yellow to black. Green stain usually seen only on the labial surface at the gum line is not decay, but a removable stain of remaining parts of the embryonic sac membrane which covers the tooth and is worn away after eruption.

Because many of these affected children are unable to communicate verbally their discomfort, the parent may not become aware of the problem until after serious damage has already occurred. Sometimes the parents notice something wrong after a fall while checking the child for tooth injury. Other parents think the teeth are stained and take the child to the dentist for cleaning. Children who prefer soft foods or who grimace or even cry when chewing cold, sweet or hard foods, should be examined for carious teeth.

FIGURES 1 and 2

Treatment

The method of restoring the teeth varies according to the amount of damage involved. Small cavities can be restored with silver amalgam, plastic or composite (newer version of older anterior tooth-filling material). More severely-damaged teeth will need crowns (caps), usually of stainless steel or polycarbonate (hard plastic). Often a pulpotomy procedure must be carried out. This involves removing as much of the crown portion of the pulpal tissues as possible and packing the pulp chamber with a modified formecresol medicament combined with other materials, usually zinc oxide and eugenol, prior to restoring the tooth. Occasionally, removal is the only possible treatment.

Because of the child's age and the extensive treatment needed, it is often best to render the needed care in a hospital under general anesthesia.

In some cases, a dental prosthesis, a removable partial denture, may be needed. Several reasons for constructing a prosthetic appliance in even a very young child include: appearance (which can contribute to a negative self-image aggravated by the teasing of other children and even unthinking adults), habits such as tongue-thrusting and abnormal swallowing patterns with concomitant speech difficulties, delayed or altered eruption of permanent teeth and mastication difficulties.

Prevention

The physician who sees the expectant mother and then the young child has an opportunity that the dentist does not. He can inform the expectant and new mothers of the value of good eating habits and the potential harm that can result from putting the child to sleep with a nursing bottle containing any carbohydrate fluid. The child's physician should examine the teeth once they begin to erupt for signs of dental disease and refer the child to the family dentist or pedodontist.

The physician can aid in dental disease prevention by also instructing the mother to clean the teeth daily after they have erupted with a small, soft toothbrush or piece of gauze. It is also important that the child receive fluoride supplements should the area drinking water not contain the one part fluoride per million parts water that is recommended for dental caries prevention.

A pamphlet—Nursing Bottle Mouth—is available from the Order Section, American Dental Association, 211 E. Chicago Ave., Chicago, IL 60611. Prices are \$1.15 for 25 copies, \$4.20 for 100 copies and \$20.05 for 500 copies. This pamphlet is suitable for expectant parents as well as parents of newborn children.

Acknowledgments

The author thanks the following individuals for their assistance: Frederick Magaziner, DDS, for his suggestions in the writing of this article and Paul D. Biederman, DDS, Assistant Professor of the Department of Pedodontics of the Baltimore College of Dental Surgery of the Dental School of the University of Maryland, who is also a Diplomate and Fellow of the American Academy of Pedodontics, for the photographs used. □

Here's how to set up your own retirement plan and earn 8% interest

Individual Retirement Accounts at The Savings Bank allow you to set aside as much as 15% of your annual income up to \$1500 a year and deduct it from your taxable income.

NO TAXES WILL BE REQUIRED ON THIS AMOUNT UNTIL YOU RETIRE —and by then you'll probably be in a lower tax bracket. See how much \$1500 a year can add up to in a Savings Bank I.R.A. Account,* the pension plan for professionals.

Years	Total I.R.A. Deposits	Total Interest Earned	Savings For Retirement
10	\$15,000	\$ 8,909.02	\$ 23,909.02
20	\$30,000	\$ 47,114.85	\$ 77,114.85
30	\$45,000	\$150,516.22	\$195,516.22

For more information or to open your own Individual Retirement Account, contact any office of The Savings Bank today.

Main Office: Charles and Baltimore Sts.
and 20 other convenient locations.

*Based on contributions of \$1500 the first of each year earning 8% interest annually and assuming the rate remains constant.

Springwood

AT LEESBURG

A private psychiatric hospital situated in the Virginia countryside 35 miles west of Washington, D.C.

Highly individualized care in a comfortable therapeutic environment

Suitable for the most demanding patients—including professionals, corporate executives, government officials, and their respective family members

A broad range of therapeutic modalities, including a specialized program for the treatment of alcohol- and drug-related problems

Individualized treatment programs which emphasize a wide variety of adjunctive therapies and outdoor recreational activities

Location

NOW effective June 1 **MONEY MARKET CERTIFICATES**

**yield 1/4% more than the average
rate on 6 month U.S. Treasury Bills**

Money Market Certificates from Arlington Federal are similar to a 6-month Treasury Bill except they pay 1/4% more than the average discount rate in the most recent weekly auction on 6-month Treasury Bills. For example, if the last Treasury Bill auction in May results in an average yield of 7.16%, our Money Market Certificate available on June 1 would have a rate of 7.41% per annum. These Certificates will be issued in minimum denominations of \$10,000, with a 6-month (26-week) maturity. There is a substantial penalty for early withdrawal.

**also 8% SAVING
CERTIFICATES**
(effective annual yield 8.33%)

You can invest in these Saving Certificates in minimum denominations of \$1,000 and receive an 8% dividend compounded annually to 8.33%. The Certificates mature in 8 years. For investors who wish a long-term, high-yield Certificate insured up to \$40,000 by the Federal Savings and Loan Corporation, this is an unusual opportunity. There is a substantial penalty for early withdrawal. Stop in at any one of our convenient offices and ask about these new Certificates that are being offered for the first time on June 1.

AN EXTENSION OF HOPE FOR THE ALCOHOLIC

HIDDEN BROOK BEL AIR

Established 1968

We are pleased to announce the opening of Hidden Brook at Warwick. This is a major new enlargement of our capacity for the treatment of alcoholics...an expansion of 20 additional beds to the 39 already at Bel Air. Beautifully situated on the waterfront of the Warwick River near Secretary, Maryland in Dorchester County...the total environment is peaceful and ideally conducive to rehabilitation. The program, philosophy and rates of Hidden Brook at Warwick will be identical and interchangeable in every respect with the program at Hidden Brook, Bel Air. Request our brochure. Write or phone for information.

Perforation of Uterus With Saf-T-Coil

By H. MELVIN RADMAN, MD

For reprint and other data, contact Dr. Radman at 3601 Clarks Lane, Balto., MD 21215.

Perforation of the uterus with a plastic contraceptive device has been encountered and reported since the resurgence of that mode of contraception.¹⁻³ The complication of accidental penetration has proved to be potentially dangerous on occasion and, at times, life-threatening.^{4,5} A variety of measures has been advanced in order to avert or minimize that type of accident. The incidence rate has been reported in various medical publications as from 0.2 to as high as 10 per 1,000 insertions.⁶ Penetration of or through the uterine musculature is believed to be related to the difficulties of insertions and is seldom caused by spontaneous migration. Ansari,⁴ in his study of the intrauterine device with a missing tail, lists some of the factors involved. He believes that accidental perforation occurs most frequently when the device is inserted by an inexperienced physician. Other reasons may be assigned to an unexplained soft consistency of the uterus, such as in the early postpartum period or subinvolution. Uterine displacement, cervical or uterine anomaly must be considered as causative factors. Failure to identify the tail of the device should be followed by instrumental uterine exploration and radiologic procedures, notably hysterosalpingography. If there is definite evidence of extrauterine location, removal of the apparatus should be accomplished by laparoscopy, laparotomy or posterior colpotomy—whichever is the most feasible and dependent upon the location and the extent of involvement of adjacent organs. The importance of the recognition of uterine penetration is emphasized by the following case report.

Case Report

This 23-year-old para 11001 was seen on June 30, 1976 with a history of irregular bleeding and abdominal pain. She had had a spontaneous delivery approximately 12 weeks prior to this consultation. Four weeks following the delivery, a Saf-T-Coil was inserted. At the time of insertion, she experienced marked abdominal and pelvic pain. Since that time, the pain has persisted, accompanied by episodes of irregular vaginal bleeding. There were no positive somatic findings. Examination of the pelvis revealed the string of the coil protruding through the cervix. The uterus was small, in anterior position and there was no evidence of adnexal pathology. Because of the discomfort and bleeding, the patient requested that the device be removed. The attempt was accompanied by lower abdominal and pelvic pain, and was unsuccessful. A flat film of the abdomen was taken, and the device was reported to be within the uterine cavity. Another attempt was made to remove the Saf-T-Coil under anesthesia. That was also unsuccessful. As a consequence, a hystrogram was done. Examination of the films revealed the device to be extrauterine and appeared to perforate the uterus

and to be lodged in the layers of the broad ligament. Exploratory laparotomy was chosen as the method of removal, since it was felt that adjacent organs were involved. At operation, the coil was found protruding through the uterine wall at the junction of the internal os and corpus. The omentum and small intestines were adherent to the loops of the coil; however, there was no evidence of injury. The coil was removed with ease and the laceration of the uterus was repaired. The postoperative course was uneventful and she was discharged from the hospital in seven days.

Discussion

While perforation of the uterus by an intrauterine device has been reported extensively, the case history presented accentuates the potential hazard of that accident. Studies have shown that the polyester spiral or loop causes only superficial endometrial reaction thereby causing little serious infection. Recent reports, however, fail to substantiate that claim. The older metal rings provoke a traumatic tissue reaction which predisposes to local infection, thereby weakening the uterine wall, and permits erosion of the device. Despite the efficiency, usefulness and encouraging results of those devices, that type has been discarded because of the concomittant dangers. A delay in the insertion of a plastic intrauterine apparatus should be emphasized so that the uterus is completely involuted and near physiologic size. In the nonpostpartum patient, the optimum time probably would be at the last day of the menstrual period. A careful pre-insertion evaluation of the pelvic organs to determine the direction of the utero-cervical canal and the depth of the uterine cavity are important preliminary steps. Correct insertion requires prior knowledge of those factors.⁷ If difficulty is encountered, the procedure should be discontinued. Perforation of the uterine wall with a plastic device may be a more serious complication than simple penetration of the uterus at curettage, since adjacent organs may be more readily injured.

Whenever in doubt, surgical exploration or laparoscopy should be performed.

FIGURE 1

Diagram that reveals perforation of uterus by Saf-T-Coil.

PHYSICIAN PLACEMENT SERVICE

The Medical and Chirurgical Faculty of the State of Maryland maintains a Placement Service for the convenience of Maryland physicians, hospitals and communities in search of candidates for positions available in our state. A detailed description of such opportunities should be forwarded to the Physician Placement Service, 1211 Cathedral St., Baltimore, MD 21201; telephone 1-301-539-0872.

Physicians wishing to locate in Maryland are invited to submit a resume to be kept on file with the Physician Placement Service. Candidates are requested to inform the Faculty when they are no longer available for consideration for opportunities which might be available in Maryland.

Journal announcements on the Classified Advertising page for Physician Placement Service are charged at the regular Classified Advertising rate.

OSLER MEDICAL CENTER

New, modern office for rent. Just completed with carpet, drapes, fixtures and many extras. Three operatories with large picture windows are ideal for EENT, Dermatology, Otolgologist or anyone requiring natural lighting. There is a Lab/Work area, storage room, private consultation room, business office and waiting room.

Must be seen to be appreciated for its design.

Call Dr. Schreiber at (301) 252-0111.

PROBLEMS IN EMBRYONIC & EARLY FETAL DEVELOPMENT

Presented by
The University of Maryland
School of Medicine
Department of Obstetrics & Gynecology
and
✚ Program of Continuing Education

This course will review some important principles of early fetal development. Recent developments in the methods of diagnosis and management of problems affecting the fetus during this early stage will be presented so that clinicians will be able to recognize common problems that may affect the fetus, understand their pathophysiology, and plan an organized approach to the management of such conditions.

DATES: May 18 and 19, 1979

LOCATION: The Baltimore Hilton Inn
Baltimore, Maryland

REHABILITATION OF PATIENTS WITH STROKE OR HIP FRACTURE

Presented by
University of Maryland
School of Medicine

This course is designed for physicians who care for disabled patients in the home, in a nursing home, or in an extended care facility. It will feature discussions and clinical presentations which are relevant to the current medical and surgical management of stroke and of various kinds of hip fractures. The clinical presentations will feature "live patients" undergoing active rehabilitation.

Dyazide[®]

Each capsule contains 50 mg. of Dyrenium[®] (brand of triamterene) and 25 mg. of hydrochlorothiazide.

Makes Sense in Hypertension^{*}

Before prescribing, see complete prescribing information in SK&F Co. literature or PDR. A brief summary follows:

*** Warning**

This drug is not indicated for initial therapy of edema or hypertension. Edema or hypertension requires therapy titrated to the individual. If this combination represents the dosage so determined, its use may be more convenient in patient management. Treatment of hypertension and edema is not static, but must be reevaluated as conditions in each patient warrant.

Contraindications: Further use in anuria, progressive renal or hepatic dysfunction, hyperkalemia. Pre-existing elevated serum potassium. Hypersensitivity to either component or other sulfonamide-derived drugs.

Warnings: Do not use potassium supplements, dietary or otherwise, unless hypokalemia develops or dietary intake of potassium is markedly impaired. If supplementary potassium is needed, potassium tablets should not be used. Hyperkalemia can occur, and has been associated with cardiac irregularities. It is more likely in the severely ill, with urine volume less than one liter/day, the elderly and diabetics with suspected or confirmed renal insufficiency. Periodically, serum K⁺ levels should be determined. If hyperkalemia develops, substitute a thiazide alone, restrict K⁺ intake. **Associated widened QRS complex or arrhythmia requires prompt additional therapy.** Thiazides cross the placental barrier and appear in cord blood. Use in pregnancy requires weighing anticipated benefits against possible hazards, including fetal or neonatal jaundice, thrombocytopenia, other adverse reactions seen in adults. Thiazides appear and triamterene may appear in breast milk. If their use is essential, the patient should stop nursing. Adequate information on use in children is not available.

Precautions: Do periodic serum electrolyte determinations (particularly important in patients vomiting excessively or receiving parenteral fluids). Periodic BUN and serum creatinine determinations should be made, especially in the elderly, diabetics or those with suspected or confirmed renal insufficiency. Watch for signs of impending coma in severe liver disease. If spironolactone is used concomitantly, determine serum K⁺ frequently; both can cause K⁺ retention and elevated serum K⁺. Two deaths have been reported with such concomitant therapy (in one, recommended dosage was exceeded, in the other serum electrolytes were not properly monitored). Observe regularly for possible blood dyscrasias, liver damage, other idiosyncratic reactions. Blood dyscrasias have been reported in patients receiving triamterene, and leukopenia, thrombocytopenia, agranulocytosis, and aplastic anemia have been reported with thiazides. Triamterene is a weak folic acid antagonist. Do periodic blood studies in cirrhotics with splenomegaly. Antihypertensive effect may be enhanced in post-sympathectomy patients. Use cautiously in surgical patients. The following may occur: transient elevated BUN or creatinine or both, hyperglycemia and glycosuria (diabetic insulin requirements may be altered), hyperuricemia and gout, digitalis intoxication (in hypokalemia), decreasing alkali reserve with possible metabolic acidosis. 'Dyazide' interferes with fluorescent measurement of quinidine.

Adverse Reactions: Muscle cramps, weakness, dizziness, headache, dry mouth; anaphylaxis, rash, urticaria, photosensitivity, purpura, other dermatological conditions; nausea and vomiting, diarrhea, constipation, other gastrointestinal disturbances. Necrotizing vasculitis, paresthesias, icterus, pancreatitis, xanthopsia and, rarely, allergic pneumonitis have occurred with thiazides alone.

Supplied: Bottles of 100 and 1000 capsules; Single Unit Packages of 100 (intended for institutional use only).

**When painful spasm
is the presenting
symptom...**

...in the functional bowel/irritable bowel syndrome*

Bentyl[®]

(dicyclomine hydrochloride USP)

10 mg. capsules, 20 mg. tablets,
10 mg./5 ml. syrup, 10 mg./ml. injection

helps control abnormal motor activity
with minimal anticholinergic side effects†

Demonstrated smooth muscle relaxant activity.

In this double-blind study, twenty patients having G.I. series and exhibiting spasm were randomly selected to receive either 2 cc. of Bentyl or sodium chloride intramuscularly. Ten minutes after the injection another radiograph was taken . . .

. . . Bentyl produced definite relaxation in 8 of 10 patients. The sodium chloride produced relaxation in only 3 of 10. No side effects occurred in either group of patients.

Pylorospasm has almost totally blocked passage of barium meal.

Barium meal beginning to pass 10 minutes after intramuscular injection of 20 mg. Bentyl.

“The correlation of spasm relief and drug given was excellent.”

*This drug has been classified “probably” effective in treating functional bowel/irritable bowel syndrome.

†See Warnings, Precautions and Adverse Reactions.

See following page for prescribing information.

Reference:

King, J.C. and Starkman, N.M.: Evaluation of an antispasmodic. Double-blind evaluation to control gastrointestinal spasms occurring during radiographic examination. A preliminary report. Western Med. 5:356-358, 1964.

Merrell

Bentyl® (dicyclomine hydrochloride USP)

Capsules, Tablets, Syrup, Injection

AVAILABLE ONLY ON PRESCRIPTION

Brief Summary

INDICATIONS

Based on a review of this drug by the National Academy of Sciences—National Research Council and/or other information, FDA has classified the following indications as "probably" effective:

For the treatment of functional bowel/irritable bowel syndrome (irritable colon, spastic colon, mucous colitis) and acute enterocolitis.

THESE FUNCTIONAL DISORDERS ARE OFTEN RELIEVED BY VARYING COMBINATIONS OF SEDATIVE, REASSURANCE, PHYSICIAN INTEREST, AMELIORATION OF ENVIRONMENTAL FACTORS.

For use in the treatment of infant colic (syrup).

Final classification of the less-than-effective indications requires further investigation.

CONTRAINDICATIONS: Obstructive uropathy (for example, bladder neck obstruction due to prostatic hypertrophy); obstructive disease of the gastrointestinal tract (as in achalasia, pyloro-duodenal stenosis); paralytic ileus, intestinal atony of the elderly or debilitated patient, unstable cardiovascular status in acute hemorrhage; severe ulcerative colitis; toxic megacolon complicating ulcerative colitis; myasthenia gravis. **WARNINGS:** In the presence of a high environmental temperature, heat prostration can occur with drug use (fever and heat stroke due to decreased sweating). Diarrhea may be an early symptom of incomplete intestinal obstruction, especially in patients with ileostomy or colostomy. In this instance treatment with this drug would be inappropriate and possibly harmful. Bentyl may produce drowsiness or blurred vision. In this event, the patient should be warned not to engage in activities requiring mental alertness such as operating a motor vehicle or other machinery or perform hazardous work while taking this drug. **PRECAUTIONS:** Although studies have failed to demonstrate adverse effects of dicyclomine hydrochloride in glaucoma or in patients with prostatic hypertrophy, it should be prescribed with caution in patients known to have or suspected of having glaucoma or prostatic hypertrophy. Use with caution in patients with: Autonomic neuropathy. Hepatic or renal disease. Ulcerative colitis. Large doses may suppress intestinal motility to the point of producing a paralytic ileus and the use of this drug may precipitate or aggravate the serious complication of toxic megacolon. Hyperthyroidism, coronary heart disease, congestive heart failure, cardiac arrhythmias, and hypertension. Hiatal hernia associated with reflux esophagitis since anticholinergic drugs may aggravate this condition.

Do not rely on the use of the drug in the presence of complication of biliary tract disease. Investigate any tachycardia before giving anticholinergic (atropine-like) drugs since they may increase the heart rate. With overdosage, a curare-like action may occur. **ADVERSE REACTIONS:** Anticholinergics/antispasmodics produce certain effects which may be physiologic or toxic depending upon the individual patient's response. The physician must delineate these. Adverse reactions may include xerostomia; urinary hesitancy and retention; blurred vision and tachycardia; palpitations; mydriasis; cycloplegia; increased ocular tension; loss of taste; headache; nervousness; drowsiness; weakness; dizziness; insomnia; nausea; vomiting; impotence; suppression of lactation; constipation; bloated feeling; severe allergic reaction or drug idiosyncrasies including anaphylaxis; urticaria and other dermal manifestations; some degree of mental confusion and/or excitement, especially in elderly persons; and decreased sweating. With the injectable form there may be a temporary sensation of lightheadedness and occasionally local irritation. **DOSAGE AND ADMINISTRATION:** Dosage must be adjusted to individual patient's needs.

Usual Dosage: Bentyl 10 mg. capsule and syrup: **Adults:** 1 or 2 capsules or teaspoonfuls syrup three or four times daily. **Children:** 1 capsule or teaspoonful syrup three or four times daily. **Infants:** ½ teaspoonful syrup three or four times daily. (May be diluted with equal volume of water.) Bentyl 20 mg.: **Adults:** 1 tablet three or four times daily. Bentyl Injection: **Adults:** 2 ml. (20 mg.) every four to six hours intramuscularly only. **NOT FOR INTRAVENOUS USE. MANAGEMENT OF OVERDOSE:** The signs and symptoms of overdose are headache, nausea, vomiting, blurred vision, dilated pupils, hot, dry skin, dizziness, dryness of the mouth, difficulty in swallowing, CNS stimulation. Treatment should consist of gastric lavage, emetics, and activated charcoal. Barbiturates may be used either orally or intramuscularly for sedation but they should not be used if Bentyl with Phenobarbital has been ingested. If indicated, parenteral cholinergic agents such as Urecholine® (bethanechol chloride USP) should be used.

Product Information as of October, 1978.

Doctors in the News

Travellers Aided by City Hospitals Scientists

Montezuma's revenge—traveller's diarrhea—is often thought to be one of the unavoidable risks of traveling in a developing country. Now a group of scientists headed by R. Bradley Sack, MD and David A. Sack, MD, of Baltimore City Hospitals and the Johns Hopkins Medical Institutions, has found that an antibiotic called doxycycline can prevent most episodes of traveller's diarrhea when taken in daily doses. Moreover, the protective effect seems to last about a week after the drug is stopped.

According to an article in a recent issue of the *New England Journal of Medicine*, doxycycline has several advantages over other antibiotics in the prevention of traveller's diarrhea. It has a long half-life, which means that only one daily dose is needed, an advantage to travellers.

The scientists studied 39 Peace Corps volunteers during their first five weeks in Kenya. The volunteers took either doxycycline or a placebo for three weeks, beginning on their flight to Nairobi, and were observed for an additional two weeks. Nine of the 21 taking placebo and only one of the 18 taking doxycycline had traveller's diarrhea during the treatment period

or for one week after the drug was stopped.

The researchers warn that although this study demonstrated a marked protective effect, they do not recommend universal use of doxycycline for all travellers to developing countries; rather, use needs to be individualized. Specifically, long-term use is not recommended, nor is treatment of children who are at risk for dental staining. Also, they warn that doxycycline would probably be ineffective in the prevention of salmonella or shigella infections. Finally, they add that only one dosage schedule (100 mg. daily) was used and that perhaps a lower or less frequent dose might be equally effective.

Traveller's diarrhea is most often caused by a bacterium called enterotoxigenic *Escherichia coli* (*E. coli*, for short)—a toxic relative of the usually harmless nonenterotoxigenic *E. coli* bacterium which inhabits everyone's gut. An infection by the toxic form of *E. coli* causes the familiar symptoms of traveller's diarrhea; watery stools, cramps, vomiting and fever.

The work was carried out in cooperation with the Division of Geographic Medicine, Baltimore City Hospitals and the Johns Hopkins University School of Medicine in Baltimore, the US Peace Corps and the National Public Health Laboratory, both of Nairobi, Kenya; the National Institutes of Health, Bethesda, MD and the World Health Organization Collaborative Center for Reference and Research on *Escherichia*, Copenhagen, Denmark. □

Metabolic and Nutritional Assessment in Adult Surgical Patients

By CONSTANTINOS P. CHILIMINDRIS, MD, FACS

Dr. Chilimindris is Surgical Director of the Intensive Care Unit of the Greater Baltimore Medical Center, 6701 N. Charles St., Towson, MD 21204. This paper was presented at the 48 Annual Meeting of the Southern Society of Clinical Surgeons at Baltimore, MD in April, 1978.

Optimal nutrition is not only difficult, but, at times, almost impossible to achieve in the debilitated hospitalized patient. Periods of relative or complete anatomical or functional disruption of the alimentary tract frequently accompany a patient's primary pathological process and may assume primary importance in his clinical course, further compounding existing nutritional problems by precluding adequate enteral feeding. In too many instances, the patient must endure excessive morbidity and may, in fact, succumb not from his primary disease, but rather from the complications of secondary starvation.

Recent experience with nutritional problems in hospitalized patients has led into the recognition of two chief entities—hypermetabolism and starvation. Within the past decade, considerable progress has been made in understanding many biological processes relating to trauma, stress and metabolism.¹ Our complete understanding of the pathophysiology of the various components of stress has led to attempts to provide nutritional and metabolic therapy as part of an overall approach to the patient and his illness.

Hypermetabolism

Patients who demonstrate hypermetabolism have, as a rule, been subjected to extreme degrees of acute and prolonged stress (major injury, major operation, sepsis, burns, pancreatitis). Injury or severe acute illness initiate a stereotypic homeostatic response in the central nervous system, signalling for appropriate physiologic and endocrine adaptations to maintain body function and preserve vital organs. The relationship between the endocrine and metabolic response is complex and depends on many factors whose roles have not been fully clarified; however, the endocrine response is vital for normal recovery and convalescence. The central nervous system is of prime importance in the mechanism which initiates the all encompassing endocrine response to stress.² Following trauma or elective surgery, the afferent stimuli reaching the central nervous system are a combination or summation of these components which initiate the final common pathway. The magnitude of the response is directly related to the strength of these stressful stimuli.

Our view of the post-traumatic metabolic response has shifted increasingly from that of a phenomenon designed solely to restore hemodynamic homeostasis to one which restores nutritional homeostasis as well. Two concepts are central to maintaining a supply of en-

dogenous substrate for the patient in stress:

- 1) The inter-relation between the ventromedial and the ventrolateral nuclei of the hypothalamus which control the regulation of food as well as the directional flow of substrate from body stores, and
- 2) The two hormones of the pancreas, insulin and glucagon.

Linking these two systems are the autonomic nervous pathways, which in the case of the sympathetic nerve fibers, originate from the ventromedial nucleus, and in the case of the parasympathetic fibers, originate in the ventrolateral nucleus. Stimulation of the ventromedial nucleus by stress leads to hyperglycemia, inhibition of insulin secretion and a rise in the levels of glucagon, growth hormone, catechols and cortisol.³ (See Figure 1). The relative deficiency of anabolic hormones, together with the relative excess of catabolic hormones secondary to stress, ensures adequate and rapid mobilization of endogenous substrates from body stores for the utilization of cell metabolism and the ultimate survival of the patient.⁴ Amino acids are needed to meet the energy requirements of the individual and also to supply substrate for protein synthesis in the healing wound. In stress, gluconeogenesis is marked, as is shown by the increase in urine nitrogen excretion that persists despite zero nitrogen intake. Insulin is under the dual influence of catecholamines and nutrients. Norepinephrine is released from the sympathetic nerve endings innervating the islets of Langerhans secondary to stress; it inhibits insulin release leading to low absolute levels of circulating insulin. This favors increased amino acid efflux from peripheral skeletal muscle. Glucagon secretion is also under the influence of catecholamines, and stress induces a rapid increase in glucagon secretion. Glucagon's main site of action is on the liver, where it enhances trapping of the gluco-neogenic amino acids, stimulates gluco-neogenesis and the de novo syn-

FIGURE 1

thesis of glucose from lactate, pyruvate and glycerol. As a result of gluconeogenesis, there is an increase in the urinary excretion of nitrogen moiety as urea and ammonia. A concomitant occurrence is the increase in the excretion of creatine and creatinine as well as bulk wasting of muscle mass as a consequence of proteolysis. Thus, high glucagon concentrations acting in conjunction with relatively-low insulin concentration ensure a steady supply of glucose, free fatty acids and ketones during situations of stress at the expense of body protein. This loss is reflected in the high urine nitrogen excretion.⁵

Starvation

Starvation is most common in hospitalized patients and may be recognized as mild, moderate or severe. It usually follows the abeyance of the hypermetabolic state, cancer, intestinal fistulae, chronic inflammatory bowel disease, chronic infection and many other debilitating medical diseases which render patients unable to sustain a normal nutritional state. Starved patients characteristically demonstrate chronic weight-

loss, protein/calorie malnutrition, anorexia, normal or low blood sugar, normal insulin levels and low-blood urea nitrogen. An example is the patient with stenosing carcinoma of the esophagus, who may have suffered chronically from dysphagia and not eating an adequate diet for a prolonged period. Such a patient often presents to the hospital with a significant weight-loss. In addition to the correction of anemia and serum protein and vitamin deficiencies, partial or complete restoration of an adequate or normal nutritional status should be contemplated for this kind of patient. Patients with other malignancies of the gastrointestinal tract, such as carcinoma of the stomach, colon and pancreas, also may fall into this category, as may patients with benign lesions leading to partial obstruction of gastrointestinal continuity, such as distal esophageal stricture or duodenal ulcer. Patients who have lost roughly 10% or greater of their body-weight should be treated with parenteral nutrition when possible prior to a planned operative intervention. Depending upon the situation, the duration of this therapy may be as short as five

days or as long as two weeks. There is certainly a strong rationale for this therapy from the standpoint of decreasing the incidence of complications secondary to poor wound healing as exhibited by anastomotic and wound disruptions.⁶ Furthermore, in the starved state, man's immunologic defense mechanisms are depressed and, therefore, his resistance is diminished to a variety of infections in the wound, the respiratory tract and in other locations.⁷ (Table 1.) If nutritional deprivation is corrected preoperatively, it is felt that the debilitated patient is better able to withstand the major surgical procedure required for correction of his disease and is afforded a lessened incidence of complications from that procedure. Patients treated preoperatively are best continued on parenteral nutrition therapy throughout the operation into the postoperative period until restoration of normal gastrointestinal function allows resumption of an adequate diet.

There are several categories of non-surgical patients who may derive benefit from supportive parenteral nutritional therapy. Patients receiving chemotherapy or radiotherapy for cancer often suffer debilitating side effects from both of these primary therapeutic entities that can be severe enough to prevent continuation of the therapy. In addition, patients receiving radiotherapy to the region of the abdomen may develop inflammatory processes within the gastrointestinal tract itself, which may prevent oral nutrition. Patients in this latter category may be treated with bowel rest and supportive parenteral nutrition. The side effects of cancer chemotherapy may also be ameliorated by supportive parenteral nutrition which provides a normal or relatively normal nutritional status and allows the continuation of the therapy in the presence of anorexia, nausea and vomiting.

Nutritional Assessment

Based on the metabolic changes that occur during stress, starvation and injury, Blackburn et al⁸ have described relatively simple methods whereby changes in body composition and body proteins can be measured.

Lean body mass and fat stores are measured by anthropometric measurements (mid-upper arm circumference, triceps skin fold, mid-arm muscle circumference and creatinine height index). Depletion of the visceral protein compartment in stress conditions is measured by a depression in the secretory proteins-serum albumin, serum transferin and total iron-binding capacity (TIBC).

Since a large number of malnourished patients are hypermetabolic, the increase in energy expenditure can be estimated by the 24-hour urinary urea nitrogen excretion. At the same time, measurement of 24-hour urinary creatinine for creatinine height index can be carried out and nitrogen balance determined by the formula: Nbal = (Nitrogen in) - (Nitrogen out) = (Protein intake in gms ÷ 6.25) - (urinary urea N + 4*) (*4 = constant for skin + fecal + urinary non urea N.)

The cellular immune system is estimated by: (i) estimation of total lymphocyte count (L-cell function) expressed by the formula:

% lymphocytes x WBC
100

(ii) delayed cutaneous hypersensitivity to common recall antigens (T-cell function). (mumps, Candida, PPD, SK/SD streptokinase/streptodornase). Syringes are prepared with 0.1 ml. of each solution just before intradermal injection. All tests are administered by one person and the diameter of induration (in millimeters) at 24 and 48 hours after injection is measured and recorded by the same observer. The skin test is considered to be positive if the diameter of the induration at either reading is 5 millimeters or greater. The patient is then classified according to his response as normal (two or more positive), relative anergy (one positive) or anergy (no positive response). Cell-mediated immunity is an important host defense system against infection, and its depression is associated with increased morbidity and mortality from infectious disease in man. In a recent study of 250 patients, Meakins et al⁹ showed a significantly higher incidence of sepsis and mortality in patients with abnormal skin tests as compared to normal responders. Of the group of patients who either remained normal or whose responses became normal, the sepsis rate was 10%, and the mortality rate was 8%; however, a sepsis rate of 57% and a 78% mortality rate were found in those patients who developed abnormal response or whose responses did not improve. Anergy or relative anergy were found to be associated with malnutrition, sepsis, shock and trauma. In the clinical setting, effective treatment with total parenteral nutrition was associated with reversal of the anergic state and an improved prognosis. Nutritional immune competence can be substantially restored after two-three weeks of adequate nutrition, which although impressive, reemphasizes the time required for nutritional repletion. (See Figure 2.)

Thus, anthropometric measurements, determination of visceral proteins and cellular immunity and estimation of the degree of hypermetabolism constitute an essential series of basic steps prior to the institution of nutritional support. (See Table 2.)

Choice of Therapy

The type of nutritional support to be provided to a patient is most accurately determined by first categoriz-

FIGURE 2: Response to nutritional support in 51 malnourished patients treated at GBMC. These parameters represent the best criteria for assessment of the efficacy of nutritional therapy.

ing the degree of depletion and/or hypermetabolism. (See Figure 3.) It is evident that, depending on the individual patient requirements and comprehensive nutritional assessment, a wide transition zone is present which allows flexibility in managing such nutritional problems utilizing the presently available regimens:

(i) 5% or 10% Dextrose

(ii) Protein-sparing therapy with hypocaloric peripherally-administrated amino acids for short-term mild-to-moderate depletion

(iii) Total parenteral nutrition (TPN) for hypermetabolic and severely-starved patients

(iv) Forced enteral feeding if the gut is functional. The response to such therapy is not immediate, there-

Summary

1. The endocrine and metabolic responses to stress and starvation are outlined.
2. Nutritional assessment of hospitalized patients with evidence of hypermetabolism and/or weight-loss of 10% of body-weight or higher should be considered.
3. Abundant evidence of increased incidence of sepsis, morbidity and mortality is demonstrated in recent literature in nutritionally-depleted patients.
4. Individuals suffering from protein/calorie malnutrition, depletion of visceral proteins and evidence of immuno incompetence should not be subjected to elective surgery, radiotherapy or chemotherapy until such changes are reversed with appropriate metabolic and nutritional support.

Pharmacology in Maryland Through 1925

By JOHN C. KRANTZ, JR., PhD

Editor's Note: Dr. Krantz was Chief, Bureau of Chemistry, Department of Health, State of Maryland, at the time this article was written in 1932. His current address is Gibson Island, MD 21056 and he is Professor Emeritus, Department of Pharmacology, University of Maryland School of Medicine.

Introduction

In the year 1526 the great physician and miracle worker Paracelsus visited the City of Basel. The message of this timely iconoclast marked an epoch in the history of the medical sciences. In his cocksure, bombastic style he thundered: "The real object of chemistry is not to make gold, but to prepare medicines."¹ And the shock of his thunder reverberated through the medical world, enlisting the science of chemistry in the warfare against disease.

The rise of organic chemistry during the latter half of the past century, and the ever-increasing number of plant principles which were isolated, created an urgent demand for an adequate trial of these new substances as therapeutic agents. To meet this emergency, the science of Pharmacology was created. It is a fundamental science, a combination of biological and physical science, a science that bridged the chasm between the maker and the prescriber of medicines, a science so comprehensive that today it touches all of the ramifications of medical practice.

Abel at Hopkins

It is indeed coincidental that the history of Pharmacology in Maryland parallels the history of the science in America. For Pharmacology as a science in America began with the appointment of John J. Abel as Professor of Pharmacology in the Johns Hopkins University in 1892. He came to Baltimore as one of the members of the original faculty when the medical school of the university was opened in 1893. Although, at the University of Michigan, Abel was engaged in Pharmacological work, the chair in this institution is called "Materia Medica and Experimental Therapeutics."

The far-reaching influence of Abel's appointment in the Johns Hopkins University is evidenced by the fact that many of the leading chairs of pharmacology in the universities of this country are occupied by the pupils of this professor, the Dean of American Pharmacology.

Prior to the appointment of Abel to his post at the

Johns Hopkins University, the professorships of Pharmacology were not as a rule considered of sufficient importance to justify the incumbents' devoting their full time and effort to the work. These positions were generally held by pharmacists who had studied medicine and inadvertently drifted into the field. The viewpoint of these men was narrow and, because of the limited training on the part of those working in the field, the realm of Pharmacology was very markedly circumscribed.

In view of these existing conditions, Abel's coming to Johns Hopkins was in direct antithesis to the conditions extant in that day. He was thoroughly trained in the biological and physical sciences and was inured by working for years under such European master scientists as Carl Ludwig, Schmiedeberg, von Nencke and Naunyn.² Besides, Abel was thoroughly imbued with the tremendous clinical significance of Pharmacology. This basic and comprehensive scientific training, and the influence of associating with men representing the preclinical medical sciences, as well as the master clinicians, are made manifest in the various ramifications of this pioneer's research attainments.

Research Stimulus

The discovery of a pressor principle in the adrenal glands by Oliver and Schaefer in 1894³ stimulated the interest of physiologists in general in this field of research. Among those attracted to this then comparatively virgin field of investigation were Professor Abel and his associates. Abel and Crawford⁴ succeeded in separating the active hormone from the adrenal glands in the form of a polybenzoyl derivative in 1897. Abel assigned the formula $C_{17}H_{15}NO_4$ to the compound.

In the autumn of 1900, Takamine visited Abel's laboratory and became interested in the separation of the new product and conceived of simplifying the process. Takamine returned to his own laboratory⁵ and prepared concentrated extracts of the glands and by the addition of ammonia (the agent that had been regularly employed by Abel to precipitate free epinephrin after saponifying his polybenzoyl compounds) obtained burr-like clusters of crystals. These crystals were not, however, identical with the active principle isolated by Abel. Takamine named his product "adrenaline" and assigned the formula $C_{10}H_{15}NO_3$ to the compound. As

it was shown later by Aldrich,⁶ the compound isolated by Takamine was epinephrin, but in a somewhat impure form. Aldrich showed that Abel had isolated the benzoyl derivative of epinephrin and if this group ($C_6H_5.CO.$) is subtracted from the formula assigned by Abel to the compound, we obtain the formula $C_{10}H_{10}NO_3$ which is close to the formula of epinephrin.

Perhaps it was the pioneer nature of Abel's research which prevented his obtaining epinephrin in the form of the free base as prepared by Takamine. Having obtained the pure benzoyl derivative, he suspected that this group could not be removed without serious modification of the molecule. These circumstances militated against this forerunner in scientific progress and permitted the isolation of the pure principle to slip from his hands, but today the scientific world recognizes the basic and fundamental character of Abel's contribution to this discovery, and he is given the full credit for having isolated the first hormone. It was Maryland's first great epoch-making contribution to the science of Pharmacology. A third of a century of clinical trial with this dependable therapeutic agent testifies to the utilitarian value of this discovery. Besides, it has been one of the most powerful tools ever placed in the hands of the physiologists to unravel some of the problems of circulation and metabolism.

Reid Hunt

It is of special interest to reiterate that just about the time Abel was in the process of the isolation of epinephrin, Reid Hunt working in his laboratory made another discovery which was destined to be of striking importance as far as knowledge of the suprarenal glands is concerned. Hunt⁷ succeeded in demonstrating the presence of a depressor substance, not choline in an aqueous extract of the glands. He showed that it differed from choline by virtue of its exhibiting a depressor action on dogs after the administration of atropine. This substance, believed by Hunt to be a precursor of choline, produced a definite depressor action when as little as 0.003 mgm. per kilo was administered. Later, this substance was proved to be acetylcholine, perhaps one of the most therapeutically-active compounds that can be produced synthetically.

Dohme and Caspari

The manufacture of dependable and standardized therapeutic agents is one of the great contributions of Pharmacology to the practice of medicine. A. R. L. Dohme of Baltimore and Charles Caspari, Jr. made a contribution of far-reaching significance in this field. Caspari was the enterprising Professor of Pharmacy in the then Maryland College of Pharmacy. Dohme had attained a doctorate in chemistry from the Johns Hopkins University and had studied abroad under the masters in his field such as Gerock, Fresenius and others. These two investigators, in a comprehensive study, showed the possibility of using titration procedures in the evaluation of vegetable drugs for their alkaloidal content and hence their therapeutic efficacy. The methods devised by Caspari and Dohme⁸ made it possible to evaluate by comparatively simple chemical procedures the therapeutic value of such dependable drugs as

nux vomica, belladonna, cinchona and opium. The fact that the methods of standardization devised by these investigators were recognized by the United States Pharmacopoeia of 1900, and thus made obligatory in pharmacy, will stand as a lasting tribute to the Pharmacology of Maryland.

Maryland College of Pharmacy

It is interesting to deviate for a moment from the history of Pharmacology to interject a brief history of pharmacy in the state on account of the close affiliation and interdependence of these fields of science. Just at this period, 1904, the Maryland College of Pharmacy, organized in 1840, became an integral part of the University of Maryland under the name of the Department of Pharmacy of the University of Maryland. This school has been outstanding in its effort to raise the status of pharmaceutical education. In fact, one of its distinguished faculty members, Henry P. Hynson, issued the first call in 1900 for a meeting of those interested in pharmaceutical education. This resulted in the organization of the American Association of Colleges of Pharmacy.

At the turn of the century, the Department of Pharmacy had associated with it Charles Caspari, Jr. as Professor of Pharmacy. Besides his contributions to alkaloidal assays, Caspari was the author of a *Treatise on Pharmacy*, a justly-famed textbook. He was one of the authors of the *National Standard Dispensatory* and distinguished himself in several revisions of the *United States Pharmacopoeia*. In 1917 at his death, the chair in Pharmacy was occupied by E.F. Kelly, who succeeded Caspari as author of the textbook and played an important role in the establishment of ethical pharmaceutical associations in the state and nation. Kelly resigned in 1925 and John C. Krantz, Jr. was appointed Professor of Pharmacy.

David M. R. Culbreth for many years occupied the chair of *Materia Medica* in the Department of Pharmacy. His book on *Materia Medica and Pharmacology* enjoyed a considerable vogue in colleges of pharmacy and marked him as a man of national reputation. Culbreth lent his energies unstintingly to the establishment of a better understanding and more friendly feeling between the pharmacist and the physician.

In 1920, this college became known as the School of Pharmacy of the University of Maryland, when that institution merged with the state college. The school is now housed in adequate quarters. It has witnessed during the last quarter of a century the metamorphosis of retail pharmacy. Through this it has steadfastly set its course in the direction of sound ethics and lofty ideals for pharmacy. In 1925 Isaac Emerson, pharmacist and distinguished citizen of Maryland, endowed in this school a chair of Pharmacology which bears his name. The first appointment to this chair was that of Marvin R. Thompson, who is doing creditable work in the field of drug standardization.

More Research

Centering our attention again on the fundamental researches which have emanated from Professor Abel's laboratory, we are attracted by the work of Abel and

Ford in 1906.^{9,10} These workers carried out extensive investigations to discover the principles present in the poisonous mushroom, *Amanita phalloides*, known in French literature as "the destroying angel." Ford had shown previously that this fungus contains two separate principles, one a hemolysin and the other a non-hemolytic toxin. Abel and Ford isolated the hemolysin and discovered that the substance was a nitrogenous sulphur-containing glucoside. The toxin was also isolated and found to contain sulphur and nitrogen. This latter substance accounts for the lethal character of the fungus when ingested.

The poisons obtained from toads have been used by Indian tribes in their warfare. It was generally employed on arrow tips and spearheads. In fact, in the beginning of the 18th century, toad poison was used in explosive shells. In 1911, Abel and Macht¹¹ began an extensive pharmacological investigation of the constituents of the creamy secretion of the glands of the skin of the large tropical toad, *Bufo Aqua*. Abel then investigated the substance chemically. It is indeed singular that he should have found in this secretion a substance which showed itself to be identical with epinephrin, which he had isolated formerly from the adrenal glands. The moist secretion was found to contain as high as 6% of epinephrin. This discovery was fundamental, as it represented the first observation of a hormone being secreted as a constituent in an external secretion. Besides the isolation of epinephrin from the toad, through a thorough chemical study, Abel succeeded in isolating another principle from the skin of the toad. He named this substance "Bufagin." Pharmacologically, this crystalline principle showed itself to be a powerful heart stimulant, similar in action to the glucosides found in digitalis leaves.

Indeed, it is interesting in connection with this work of Abel and Macht to mention that almost two decades later, K. K. Chen, working in Abel's laboratory, made an intensive and important contribution to our knowledge of the pharmacology of the toad constituents. The title of the publication was *A Pharmacognostic Study of Ch'An Su, the Venom of the Chinese Toad*.¹²

The pioneer physician and explorer, David Livingstone,¹³ first suggested the use of arsenic in the treatment of African sleeping sickness, a disease known now to be caused by the "Trypanosoma Gambiense." Later, Breinl¹⁴ used tartar emetic, an antimony-bearing compound, with a degree of success in the treatment of this infection in rats; however, in 1910, Abel and Rowntree¹⁵ made a brilliant contribution to the chemotherapy of antimony. They prepared antimony thioclycollamide and antimony sodium thioglycollate. These compounds were tested on rats, rabbits and dogs inoculated with trypanosomes. The results were so impressive that the compounds were recommended for use in the treatment of human trypanosomiasis. These drugs have played an important role in the treatment of this serious malady; but, in addition to the use of Abel's compounds in the treatment of African sleeping sickness, Randall¹⁶ employed the drugs in the treatment of a tropical disease known as *Granuloma Inguinale*.

This contribution of Abel to Maryland Pharmacology

has been looked upon as marking a definite step in the progress of chemotherapy. Besides, it possibly stimulated the workers of later years in the production of Bayer 205—a potent trypanocidal drug devoid of any toxic metal.

Maryland Publications

While Professor Abel and his collaborators were engaged in these various fields of scientific endeavor, another lasting contribution to Pharmacology emanated from this laboratory. Abel was quick to realize that the organization and correlation of the rapidly pyramiding contributions to the basic medical sciences were of paramount importance. Accordingly, in 1905, in conjunction with the late Dr. Christian A. Herter, Abel organized the *Journal of Biological Chemistry*. Today, this publication stands as one of the foremost scientific periodicals of the world. Four years later, he founded the *Journal of Pharmacology and Experimental Therapeutics*, of which he remained editor during its nearly quarter of a century of successful service to pharmacologists and physicians. Thus, the pharmacologists of Maryland may well pride themselves in the fact that in their field of science most of the investigations originating in this country are published in their own journal, which now has become the property of the pharmacologists of the world. Besides these far-reaching activities in the publication of scientific work, Professor Abel was instrumental in the founding of the American Society of Biological Chemists and American Pharmacological Society. Each of these organizations today is flourishing and prolific in its contribution to the biological sciences.

Phthalein Dyes, etc.

Abel's interest in clinical medicine was evinced by his investigations in 1910 with Rowntree on the phthalein dyes. These two investigators discovered that phenolsulphonphthalein prepared by Ira Remsen was excreted solely by the kidney. Although in this investigation Abel was searching for a purgative that could be administered subcutaneously or intramuscularly after laparotomies, he failed to find such a drug; but with his scientific alacrity, he immediately suggested the use of the dye as a diagnostic agent in functional disturbance of the kidney. Rowntree and Geraghty¹⁷ carried this work to a successful conclusion by the development of the so-called renal function test, which depends upon the capacity of the kidney to secrete phenolsulphonphthalein after injection of the dye. For two decades, this test has remained as a most valuable and dependable diagnostic procedure in the hands of the urologist.

Indeed, this diagnostic test originating in Abel's laboratory was the precursor of the functional liver test. Within a few years after the discovery of the kidney function test, Rowntree et al¹⁸ used phenoltetrachlorphthalein to measure the functional activity of the liver.

It was in this period that Professor Abel began his classical researches on vividiffusion.¹⁹ He succeeded in devising an apparatus by means of which blood from a living animal could be diverted from its circulation through a series of dialyzing tubes. The blood was then returned to the circulation of the animal. During its

passage through these diffusion tubes, the blood loses by dialysis small molecules such as amino acids and glucose. On the other hand, the large protein molecules and the blood corpuscles remain in the circulating blood. It was by means of this apparatus that Abel and his associates were able to demonstrate the presence of many diffusible compounds existing in a free state in the blood which prior to this time were not known to exist in the circulating blood. Here, for the first time, definite proof was given that the amino acids exist in the free state in the circulating blood and not in a bound form as polypeptides or coagulable proteins. Abel's first announcement of these findings was made at the spring meeting of the Association of American Physicians in Washington in 1913. Abderhalden later substantiated the results of Abel and his co-workers after Abel and Rowntree had given public demonstrations of their method in the summer of 1913 both in London and in Groningen. He isolated one new compound from the dialysates of circulating blood of dogs, namely A-isobutylhydantoin.

It is this vividiffusion apparatus of Abel which is so often referred to as the artificial kidney. Although not a preferential filter as the normal kidney, it is true that, by the proper adjusting of the nature and the concentration of the substances in the liquid surrounding the diffusion tubes, many otherwise diffusible substances can be made to remain in the circulation. In fact, Professor Georg Haas of Giessen has used the apparatus with certain modifications to alleviate the symptoms of patients seriously-ill with glomerulonephritis.

More Investigations

Within this same period a very important contribution to endocrinology as well as drug therapy was published from the Department of Pathology of the Johns Hopkins University. In 1909, MacCallum and Voegtlin²⁰ demonstrated the presence of a hypocalcemia in dogs from which the parathyroid glands had been removed. They further showed that the classical symptoms of tetany could be removed in these parathyroidectomized animals by the injection of soluble calcium salts. This work was the forerunner of the later work of Luckhardt and others in calcium therapy and from this the use of organic salts of calcium such as the lactate and gluconate became rational therapeutic agents.

By the year 1910, Abel's laboratory had become a veritable mecca of pharmacological investigations. Many scientists interested in drugs and the extraction of hormones came to work in the professor's laboratory and imbibe from him his unquenchable and unconquerable passion for scientific investigation. Chemists, clinicians, pharmacologists have sat at the luncheon table in the professor's laboratory where he freely and modestly discussed and evaluated contemporary scientific work. Little did these men realize that, as disciples of the great teacher, they would be the leaders in the Pharmacology of the next decade.

David I. Macht

One of the most interesting and indefatigable workers who associated himself with Professor Abel was David I. Macht. Macht distinguished himself as a

scholar in the public schools of Baltimore and at the Johns Hopkins University, where he later studied medicine. This brief account of the Pharmacology of Maryland has already mentioned his name as collaborator with Abel in the pharmacological investigation of "Bufagin," but Macht, himself, soon became interested in a variety of lines of research which, within a quarter of a century, have touched on many of the fundamental medical sciences as well as contributed to various clinical phases of medicine.

Perhaps the most significant and thorough investigations contributed by Macht²¹ were his pharmacological studies of the opium and belladonna alkaloids. Through a comprehensive study of the chemical constitution of these alkaloids in comparison with their action on smooth muscle, Macht was led to believe that the benzyl group common to many such compounds was responsible for much of their antispasmodic activity. Accordingly, he recommended the use of benzyl alcohol and certain benzyl esters as therapeutic agents. For more than a half-decade, these compounds enjoyed a considerable vogue as antispasmodic drugs in the hands of many clinicians. Later work²² showed that what was considered to be a specific effect of the benzyl group is an effect that can be produced by many alcohols of high molecular weight.

Dr. Macht, a thorough student of the Bible, examined some of its folklore and edicts by means of scientific experiments. Perhaps one of the most interesting investigations of this nature was his work with Lubin²³ in 1923. He interested himself in the biblical injunction of the purification of menstruating women. He discovered a toxin in the perspiration of menstruating women, which was not present at other times. This toxin inactivated yeast and caused the rapid withering of flowers. Besides it was toxic to the protoplasm of certain seedlings. It is unfortunate that Macht did not finish this work and bring this most promising investigation to a convincing conclusion by the isolation of some definite chemical principle shown to be responsible for the biological results observed.

Later, Macht became interested in developing the field of phytopharmacology in which he and his co-workers used the seedlings of lupinus albus as test objects upon which to determine the presence of toxins²⁴ in blood serum and to measure quantitatively the potency of certain drugs.²⁵ This method has been shown by various workers to be valuable in qualitatively detecting the presence of toxins or other bodies which have a deleterious action on plant protoplasm. Quantitatively, the method warrants further study; perhaps the greatest criterion of its accuracy and significance could be ascertained by a critical statistical study.

In the early Twenties, Macht became interested in the physical factors which influence the potency of drugs. He studied the influence of various radiations on different drugs which led him ultimately to an extensive investigation of the action of plane-polarized light on drugs. Macht²⁶ published many articles on this most interesting subject and pointed out many possible practical applications of his findings, yet there seems to be a diversity of opinion among the workers²⁷ in this field

as to the actual influence of polarized light as a deteriorating effect on drugs. Recently, a European investigator pointed out that one of the optical isomers of a brominated aliphatic hydrocarbon was completely destroyed under the influence of circularly-polarized light, while the other isomer remained unaffected. More experimental work will be necessary to determine the ultimate nature and significance of these observations.

Macht has contributed more than 300 communications to Pharmacology and related sciences published in many of the leading scientific periodicals of the world. During the quarter century period covered by this treatise, he distinguished himself as one of Maryland's most prolific contributors to scientific literature.

More Researchers

Soon after Professor Abel had completed his work on vividiffusion, Kendall²⁸ in 1916 succeeded in isolating thyroxine, the second hormone to be separated as a pure chemical entity. About this time, Abel became interested in the active principle or hormone in the posterior lobe of the pituitary body. In 1919, through a series of extensive investigations, Abel and Kubota²⁹ demonstrated the presence of histamine in the posterior lobe of the pituitary body. By means of a more-or-less complicated extraction process, these workers succeeded in obtaining the dipicrate of histamine. They showed that the histamine picrate obtained from the pituitary body is identical with synthetically-prepared histamine picrate, in respect to crystalline form, melting point, solubility and physiological behavior.

In 1922, Abel and Rouillier³⁰ described a method for preparing a principle or hormone from the infundibulum of the pituitary gland, which exhibited an oxytocic activity equal to from 20 to 30 times its own weight of the acid phosphate of histamine. With numerous other investigators, Abel pounded away on the isolation of this active principle of the posterior lobe of the pituitary body. Other investigators associated with Abel in this study were Nagayama,³¹ Roca³² Campbell³³ and E.M.K. Geiling,³⁴ who became Associate Professor of Pharmacology under Abel.

Pituitary Gland

From the very first, the investigators who had concerned themselves with the pharmacology of the infundibulum of the pituitary gland had assumed a multiplicity of active principles: some postulating three and others four separate principles. In making these separations, the active extracts employed had been subject to rather drastic treatment with acids. Early in 1928, Kamm³⁵ and his associates succeeded in separating two of these principles from gland extracts, but did not succeed in isolating them as chemical entities. One B-Hypophamine was obtained as a pressor principle devoid of oxytocic action. The other B-Hypophamine, or the oxytocic principle obtained, was found to be 150 times as potent as pituitary powder. The B-Hypophamine is now known to possess antidiuretic as well as melanophore-expanding properties and, according to the prevailing view, does not consist of a pure pressor principle, but appears to be mixture of several principles. Abel³⁶ has given an analysis of the various actions of B-Hy-

pophamine in one of his recent papers. He still contends that the principle of the posterior lobe is one chemical entity responsible for both pressor and oxytocic activities. The subject remains an unsettled question and further investigational work must be conducted in order to solve the problem.

Working in Professor Abel's laboratory, Geiling³⁷ made a fundamental and important contribution to our knowledge of the physiology of the posterior gland. He showed that the intravenous injection into trained, unanesthetized dogs of relatively small doses of pituitrin and pitressin (the pressor fraction) produces for a short period a state resembling an anaerobic metabolism in the tissues drained by the superficial and deep veins of the dog. During this time the venous blood has an arterial-like color and oxygen content, a lowered carbon dioxide tension, a rapidly rising lactic acid, increased glucose and inorganic phosphate. This is the period of decreased cardiac output and lowered basal metabolism.

Following this stage of tissue asphyxia is the recovery period when conditions are reversed: an abnormally dark venous blood, increased utilization of oxygen and production of carbon dioxide by the tissues, and a continued rise and subsequent gradual return of lactic acid to the pre-injection level. In the jugular vein, however, during the stage of maximum action, the blood is more venous in character and has a decreased oxygen content. Direct measurement of the oxygen consumption of these dogs shows a striking parallelism between the gaseous metabolism and blood changes noted above.

With Grollman, similar studies were carried out on man with therapeutic doses of post-pituitary preparations and the results are in accord with those found in animal experiments. These results offer proof that the posterior lobe hormone is one of the important regulators of metabolism and also afford the basis for reconciling the discordant results of previous investigators who have interested themselves in the role of the posterior lobe secretion in metabolism. Geiling has investigated some of the pharmacological aspects of other endocrines, such as insulin, epinephrin and the anterior lobe of the hypophysis. He has laid special emphasis on work with unanesthetized subjects owing to the marked interference of anesthetics with the normal physiological functions in the animal organism.

Organic Dyes

In 1917, a chemist, E. C. White, associated himself with H. H. Young of the Brady Institute of the Johns Hopkins Hospital. Young was interested in studying the effect of organic dyes containing germicidal metals in the treatment of infectious diseases. In 1912, Geraghty had suggested the same problem to H. A. B. Dunning of Baltimore. Dunning did a considerable amount of work in the preparation of silver-containing phthaleins.

However, he did not carry the work to a satisfactory conclusion. White³⁸ prepared a number of azo mercurials and also phthaleins containing mercury. They found dibromoxymercurifluorescein to be the most promising of the series and it was studied clinically by various workers. Commercially, the disodium salt was marketed in 1920 under the name of mercurochrome. Young recommended mercurochrome for intravenous

injections in septicemias, but the drug is not generally accepted as being safe for intravenous medication. As an external antiseptic for cuts and abrasions, the 2% solution of the drug has enjoyed wide use, but, in addition to the utilitarian value of the drug, its success as a therapeutic agent heralded the production of a great number of new antiseptics; perhaps among these some day will be discovered the "Magna Therapia Sterilsans" of Paul Ehrlich.

In 1913, T. B. Johnson³⁹ of Yale prepared certain alkyl resorcinols and showed that the germicidal activity of these compounds increased as the number of carbon atoms in the aliphatic side chain was increased. In 1921, Lane,⁴⁰ in his PhD thesis working under Johnson, prepared butyl resorcinol. Accordingly, in 1922, it occurred to A. R. L. Dohme⁴¹ that it would be well worthwhile preparing those higher derivatives containing, five, six and seven carbon atoms in the aliphatic side chain. In conjunction with V. Leonard,⁴² it was shown that the compound having six carbon atoms in the side chain, namely hexylresorcinol, was most germicidal.

This compound was introduced into medicine as a urinary antiseptic of high germicidal capacity. Later, Leonard and Frier⁴³ found that the compound in glycerin-water solution markedly reduced the surface tension of the mixture and the substance became extensively employed as a local antiseptic. This interesting drug perhaps owes its principal utilitarian value as a local antiseptic to its comparatively non-toxic nature.

Department of Pharmacology

In 1920, the School of Medicine of the University of Maryland appointed W. H. Schultz as Professor of Pharmacology. This marked the beginning of a department devoted entirely to Pharmacology in this university. Schultz came with excellent training: a PhD in Physiology under Howell. In his department, O. G. Harne developed a very useful instrument used in pharmacological instruction. This apparatus is known as the University of Maryland Chronograph, and it enables the entire class of students to operate their pharmacological experiments with a central electrical control with the same ease as though one experiment alone were being conducted.

After the isolation of insulin by Banting and Best⁴⁴ in 1921 in the form of a therapeutically-active extract, Professor Abel, now a seasoned veteran in hormone isolation, turned his attention to this pancreatic hormone. Perhaps in this field, Abel's crowning achievement in Pharmacology was made. After extensive work, in 1926, Abel⁴⁵ announced the isolation of the pancreatic hormone in a crystalline form. Abel's crystalline insulin is characterized by its high labile sulphur content. This work initiated a brilliant series of researches in Abel's laboratory on the chemical nature of this substance. Abel⁴⁶ and his associates showed the empirical formula of the hormone to be $C_{45}H_{75}N_{11}S$. Further investigations in Abel's laboratory showed insulin to be a molecule that chemically can be classed as a protein. It marks the first isolation of a hormone that can be classified as a protein. Abel showed that his crystalline substance was decomposed by the ferments of the intestinal tract

and hence the possibility of oral administration seemed to be precluded.

Quarter-Century Close

This epoch-making discovery marks a fitting close to the quarter of a century of Maryland's contributions to Pharmacology. Space will not permit discussing the significant researches made by Abel's students among whom are Faust, Crawford, Hunt, Aldrich, Lowenhart, Barbour, Voegtlin, Rowntree, Lamson, Macht and Geiling. These men have moulded and shaped modern Pharmacology. Now in the twilight of life, the Professor stands, with the enthusiasm and courage of life's high noon, a veritable challenge to all of his students. Working daily with test tube, kymograph and pen, he is in Pharmacology as Dante said of Aristotle, "master among those who know."

Thus Maryland has served preeminently as the cradle of modern Pharmacology in America during the past quarter of a century. With the increasing number of new drugs and the ever-widening scope of this field of science, Maryland has endeavored to keep pace. One may predict with sufficient assurance for human purposes that when the next quarter of work is written, although many of the masters with us now will have passed on, their influence will dominate their students, and the Pharmacology of Maryland will again occupy a position of preeminence.

Consider the advantages of **COMPLETE MEDICAL EQUIPMENT LEASING**

More and more professional men and women are discovering that leasing equipment from Savers Leasing Corp. can be a lot more practical than buying. Here's why:

- A plan tailored to your professional needs
- No initial capital outlay
- Extended terms available
- Complete turnkey leasing
- The ability to acquire the latest in medical equipment

Call 539-0108 for all the details. It might be the most important move you make all day.

**SAVERS'
LEASING

Librax®

Each capsule contains 5 mg chlordiazepoxide HCl and 2.5 mg clidinium Br.

Please consult complete prescribing information, a summary of which follows:

Indications: Based on a review of this drug by the National Academy of Sciences—National Research Council and/or other information, FDA has classified the indications as follows:

"Possibly" effective: as adjunctive therapy in the treatment of peptic ulcer and in the treatment of the irritable bowel syndrome (irritable colon, spastic colon, mucous colitis) and acute enterocolitis.

Final classification of the less-than-effective indications requires further investigation.

Contraindications: Glaucoma; prostatic hypertrophy, benign bladder neck obstruction; hypersensitivity to chlordiazepoxide HCl and/or clidinium Br.

Warnings: Caution patients about possible combined effects with alcohol and other CNS depressants, and against hazardous occupations requiring complete mental alertness (e.g., operating machinery, driving). Physical and psychological dependence rarely reported on recommended doses, but use caution in administering Librium® (chlordiazepoxide HCl) to known addiction-prone individuals or those who might increase dosage; withdrawal symptoms (including convulsions) reported following discontinuation of the drug.

Usage in Pregnancy: Use of minor tranquilizers during first trimester should almost always be avoided because of increased risk of congenital malformations as suggested in several studies. Consider possibility of pregnancy when instituting therapy. Advise patients to discuss therapy if they intend to or do become pregnant.

As with all anticholinergics, inhibition of lactation may occur.

Precautions: In elderly and debilitated, limit dosage to smallest effective amount to preclude ataxia, oversedation, confusion (no more than 2 capsules/day initially; increase gradually as needed and tolerated). Though generally not recommended, if combination therapy with other psychotropics seems indicated, carefully consider pharmacology of agents, particularly potentiating drugs such as MAO inhibitors, phenothiazines. Observe usual precautions in presence of impaired renal or hepatic function. Paradoxical reactions reported in psychiatric patients. Employ usual precautions in treating anxiety states with evidence of impending depression; suicidal tendencies may be present and protective measures necessary. Variable effects on blood coagulation reported very rarely in patients receiving the drug and oral anticoagulants; causal relationship not established.

Adverse Reactions: No side effects or manifestations not seen with either compound alone reported with Librax. When chlordiazepoxide HCl is used alone, drowsiness, ataxia, confusion may occur, especially in elderly and debilitated; avoidable in most cases by proper dosage adjustment, but also occasionally observed at lower dosage ranges. Syncope reported in a few instances. Also encountered: isolated instances of skin eruptions, edema, minor menstrual irregularities, nausea and constipation, extrapyramidal symptoms, increased and decreased libido—all infrequent, generally controlled with dosage reduction; changes in EEG patterns may appear during and after treatment; blood dyscrasias (including agranulocytosis), jaundice, hepatic dysfunction reported occasionally with chlordiazepoxide HCl, making periodic blood counts and liver function tests advisable during protracted therapy. Adverse effects reported with Librax typical of anticholinergic agents, i.e., dryness of mouth, blurring of vision, urinary hesitancy, constipation. Constipation has occurred most often when Librax therapy is combined with other spasmolytics and/or low residue diets.

ROCHE

Roche Products Inc.
Manati, Puerto Rico 00701

In treating irritable bowel syndrome*

Enhance your therapeutic expectations
with

Librax[®]

Each capsule contains
5 mg chlordiazepoxide HCl
and 2.5 mg clidinium Br.

antianxiety/antispasmodic/antimotility

Librax is unique among G.I. medications
in providing the specific antianxiety action of
LIBRIUM[®] (chlordiazepoxide HCl) as well as the potent
antispasmodic and antimotility actions of
QUARZAN[®] (clidinium Br) for adjunctive therapy
of irritable bowel syndrome.

ROCHE

Librax has been evaluated as possibly effective for this indication.
Please see brief summary of prescribing information on preceding page.

EMPIRIN COMPOUND c CODEINE

Each tablet contains: aspirin, 227 mg; phenacetin, 162 mg; and caffeine, 32 mg; plus codeine phosphate in one of the following strengths: #4—60 mg (gr 1); #3—30 mg (gr 1/2); #2—15 mg (gr 1/4); and #1—7.5 mg (gr 1/8). (Warning—may be habit forming).

Doctors in the News

Dr. Schumacher Tapped

Dale N. Schumacher, MD, has been named Assistant Chairman of the Department of Medicine and Director of Medical Care Studies at St. Agnes Hospital, Baltimore.

In this newly-created position, Dr. Schumacher will be working to better facilitate the practice of medicine at the Hospital by decreasing some of the administrative duties required of members of the attending staff.

Dr. Schumacher will work with the Medical Audit Committee and assist in matters pertaining to the Professional Standards Review Organization. He will assist in recruitment of residents for the Department's training program and work as a liaison with the various regulatory agencies including the Maryland Health Services Cost Review Commission.

Dr. Schumacher holds a bachelor's degree from the University of Arizona. He received his MD degree from the University of Illinois in 1969, and one year later received a Master's Degree in medical education from the same institution.

He completed his Internship and Residency at a combined Johns

Hopkins-Baltimore City Hospital program. Most recently, he completed a three-year postdoctoral Fellowship at the Johns Hopkins University School of Hygiene and Public Health.

Dr. Schumacher is a native of Chicago. He is married to the former Barbara Parker, a Registered Nurse and an Instructor of Nursing at the University of Maryland. The couple resides in the Elkridge section of Howard County with their three children. □

DR. ZAW-WIN

Dr. Zaw-Win Picked

Dr. Bo Zaw-Win, formerly of Rangoon, Burma, has been named Assistant Medical Director of the Levindale Hebrew Geriatric Center and Hospital, it was announced recently by Levindale President Alfred I. Coplan.

The Medical Director is Dr. Noel List.

Dr. Zaw-Win, who emigrated to the US approximately five years ago, came to Levindale in 1975 after completing his Residency in Internal Medicine at Franklin Square Hospital in Essex, because of his particular interest in the specialty of Geriatrics. He has also had a year's internship at Doctors' Hospital in Washington, DC, with a two-months rotation at the Walter Reed Army Medical Center.

Dr. Zaw-Win did his undergraduate work at Rangoon University,

where he received his medical training at the Institute of Medicine, graduating among the top five of his class in 1969. Following graduation, he accepted a teaching post as Clinical Instructor in the Institute.

Dr. Zaw-Win received his early education at Christ Church Cathedral School in Oxford, England, while his father was serving as Burmese Ambassador to France.

Dr. Zaw-Win is an associate of the American College of Physicians and a member of the Gerontological Society. □

Dr. Rogers Named

Dr. Mark C. Rogers has been appointed Director of the Division of Pediatric Intensive Care at the Johns Hopkins Children's Center and of the Hospital's Pediatric Intensive Care Unit (PICU), the regional referral center for pediatric intensive care patients and one of the largest of such units in the country.

Trained in Cardiology, Anesthesiology, Intensive Care and Pediatrics, Dr. Rogers is introducing new approaches in the care of critically-sick infants and children at Hopkins. In particular, he has helped coordinate an expanded scope of care in the PICU to cover neurological problems, as well as the traditional areas of cardiac and pulmonary problems. According to Dr. Rogers, the PICU now has an organized team approach to the treatment of a whole range of conditions which may cause neurological (i.e., brain) damage in children, including trauma, meningitis, drownings and shock.

Working with neurologists and neurosurgeons, studies are being conducted to determine if new monitors can detect brain swelling early. Techniques to reduce that swelling are also being assessed to determine which treatment is most effective. Recent research has shown that increased intracranial pressure, or brain swelling, may be a major cause of neurological damage, Dr. Rogers explains. It seems that in cases where oxygen flow to the brain is cut, the brain begins to swell, further decreasing oxygen

(Continued on p. 73.)

DR. SCHUMACHER

THE MANY FACES OF DR. ALLEN

LEFT:

DR. ALLEN NAMED STATE SENATOR—Med-Chi member, Annapolis physician, former Republican member of the Maryland House of Delegates, GOP State Party Chairman and recently his party's candidate for the post of Lieutenant-Governor of the Free State, **Dr. Aris T. Allen** (seen in this photomontage by artist Claude Brooks) was recently named State Senator to represent Anne Arundel and Calvert Counties. The 67-year-old Annapolitan filled the vacancy created by the death of Sen. Edward T. Hall (R., 30th.) Dr. Allen was featured in a **Journal** cover story in its June, 1977 edition. He is seen at left with (clockwise) Juanita Jackson Mitchell, former Baltimore Mayor Thomas J. D'Alesandro (left), Anne Arundel County Executive Robert Pascal and former Maryland Gov. Marvin Mandel.

(Dr. Rogers . . . Con't. from p. 71.)
flow and further increasing the chance of damage to the brain, he says. Therapies, such as controlled ventilation, induced hypothermia—the cooling of the body below its normal temperature—and drug treatments may be effective in decreasing the swelling of the brain in severe conditions.

Dr. Rogers emphasizes the importance of treating critically-ill children in units specifically geared to their needs. "Medical procedures that are useful on adults can not always be used on children," he says. "There are a number of technical and medical considerations to be taken into account in the care of critically-sick infants and children. For example, they don't respond to stress as well as adults. This is why we need specialized units staffed with specialized pro-

fessionals to care for these young patients."

The PICU at Hopkins features sophisticated cardiac output machines, which can be used on infants as small as two or three pounds; sensitive monitoring equipment which constantly monitors pressures in the heart, blood vessels and head, specially-designed respirators and a highly-trained staff of doctors and nurses. "The nurse-patient ratio is 1:1, and at no time is a doctor more than 25 feet from a patient," says Dr. Rogers.

Dr. Rogers, who was educated at Columbia University and Upstate Medical Center in Syracuse, completed his training at Massachusetts General Hospital and Children's Hospital Medical Center (both in Boston), Duke University Medical Center and Harvard Medical School. Associated with Dr. Rogers

in the PICU is Dr. Stephen Nugent, who trained in Pediatrics and Intensive Care in Philadelphia, and Dr. James Robotham, of the Pediatric Pulmonary Division. □

These Pagers Mean Business.

Renting A Beeper?

A significant portion of your monthly charge is for equipment — not the actual paging. The rental price includes equipment, paging and maintenance.

Ownership Reduces Monthly Charges

The most practical solution to lowering the monthly charge for paging is to supply your own equipment. In this manner you can save up to \$13.50 each month! Coverage and convenience remain the same.

Choosing Your Communications Supplier

Evaluate total costs — purchase price and maintenance. Every pager sold by Mountainside has a 3 year parts and labor warranty, assuring you of no hidden extra charges. Whatever your paging needs, whichever features you require, they are available with our equipment.

Auxiliary

MRS. THOMAS F. HERBERT
President

MRS. R. KENNEDY SKIPTON
Editor

Cecil County Auxiliary History

The Cecil County Auxiliary had its beginning sometime in the 1940s. The information is very sketchy. Interest faded and not until about 1962 did the Auxiliary reorganize. June Ross was President and the members became quite active and interested in helping the Cecil County Day Care Center get situated. A large cash donation was given by the Auxiliary to help with the new building. Millie Johnson was a strong supporter of the project. Another of our projects has been helping a young student from the area to enroll and graduate from a school that teaches rehabilitation and speech therapy.

We still take blood pressures at the local Courthouse one day a month. This has been our continuing project through the years. Many of the senior citizens in the area look forward to this monthly visit.

Our members meet the second Tuesday of each month for a dinner. Attendance is small, about five or six members. Many of our former active members have retired or moved to other areas. Many were from Perry Pt. and the now phased-out Bainbridge.

Each year, we have our family picnic at one of the members' homes. This is a fun time and our families get to know each other a little better.

Doctors' Day is still celebrated in Cecil County.

MRS. JOSEPH LANZI
President, Cecil County

Charles County Auxiliary History

In the Spring of 1977, several physician spouses met with the then-State President Helen Boyer and State President-Elect Carol Broadus for the purpose of forming a County Auxiliary. We chose temporary officers who worked over the summer to get support for this venture.

In October, 1977, we held our first meeting after having received approval from the President of the Charles County Medical Society, Dr. Chinmoy Banerjee. There were 15 people present. The basic structure of a county auxiliary was discussed and plans to move forward were made. Those present approved the first official officers: Nancy Howell, President; Marlene Kassem, Treasurer and Fatima Haziq, Secretary. Mrs. Haziq was later replaced by Christie Mason.

In January, 1978, we sent out a questionnaire to all other physician spouses who were not present at the October meeting. The response was less than we had hoped. This was to become the first in a long line of disappointments.

AUXILIARANS at FALL CONFLUENCE, Chicago, 1978 (left to right, seated): Mary Strauss, Connecticut President and President-Elect, Helen Anderson, Lillian Tumbusch and two S. Dakotans. (Standing, left to right) Vicky Kretkowski and Med-Chi staffer Kim Judy. (Auxiliary photo.)

On July 29, 1978, Nancy Howell and Marlene Kassem became instructors in CPR. This may well be our major contribution to the community as a group since we have given to course to approximately 100 people and had the whole month of January, 1979 booked with other courses. We ask for donations, which go to the Greater Waldorf Jaycees for the use of their equipment, and the rest will become a donation to the AMA-ERF. We are very proud of this accomplishment.

The Rotary Club of La Plata has approached us to assist it with the Arthritis Society of Southern Maryland in manning a hotline for questions and places of treatment.

We have also been asked to help with CME symposia in conjunction with the local hospital. Dr. Saad Kassem, the Education Chairman of Physician's Memorial, would like a program for the physicians, nurses and other health care personnel in our area. We would be assisting from the registration and strategical end.

Our most disappointing area has been the lack of membership. We would like to enlist the physicians of the County in this endeavor. If the doctors will recognize us and encourage their spouses to join us, we feel that we can accomplish much. We have the time and, if we desire, can expend the effort to do those things the doctor would like to do but cannot because of the lack of time. We are an AUXILIARY, an aide, a helper, an expansion of the main group. With more members, we can show the community what the medical sector can and does do for it. Without support, we will cease to exist. None of us wants that to happen.

We hope that as Charles County grows, more of the new doctors and their spouses will join our group of three. We won't give up and we hope no one else gives up hoping and praying for us.

MRS. DANIEL M. HOWELL
President, Charles County

THE MADRID RESTAURANTE

The Madrid's delectable Spanish and continental cuisine, served in the charming atmosphere of Old Spain, comes highly recommended by Gourmet Magazine and other fine-food publications. Owner and chef Pepe is proud to offer any of his specialties... filet of sole in grappe sauce, paella marinera, chicken cordon bleu, calf sweetbread Toledo-style, and steak flambé. Plenty of tasty desserts to choose from, including home-style Baked Alaska. Baltimore's only flamenco show starts at 9 PM on Fridays and Saturdays only. Lunch served Monday through Friday. Dinner is served seven days a week.

SERIOUS RUNNERS RUN ATHLETIC ATTIC

FOR SERIOUS RUNNERS.

Running is our life. Just as it is yours. We are serious runners. We are Marty Liquori, Greg Fredericks, Ken Schappert, Jeff Howser, Mel Pender, Steve Foster, and many more. In fact, the great majority of our stores are managed by accomplished athletes.

We founded Athletic Attic to provide top quality gear to serious runners like ourselves. And like yourself.

We've been to that breaking point. We've run those hundred mile weeks. So when we select a product for our shelves, we go about it very seriously. And we apply our experience thoroughly.

The result — Athletic Attic consistently has the best selection of running shoes and equipment available anywhere. So if you're serious about running at your best, come to Athletic Attic. We've got what you're looking for. Seriously.

Glen Burnie Mall, Ritchie Highway
766-5284

For INSENSITIVE foot management
we now offer:

- ★ EXTRA DEPTH shoes in variety of types and soft leathers.
- ★ Accomodative, impression molded inlays, for proper weight distribution, made of PLASTIZOTE or PELITE.
- ★ Custom MOLDED footwear as required.
- ★ Also—Complete prescription service, including many special purpose shoes and shoes suitable for brace attachment.

Store Hours 9:30 to 5:15,
except Thursday to 8:00 P.M.

Information for Authors

MED-CHI MEMBERS reading papers before Faculty or other organizations are invited to submit their papers to the **JOURNAL** for consideration by the Editorial Board for publication.

MANUSCRIPTS: Manuscripts will be accepted for consideration for publication with the understanding that they are original, have never before been published and are contributed solely to the *Maryland State Medical Journal*. An abstract or summary, limited to 200 words, should be included.

All manuscripts are acknowledged upon receipt and are followed up by notification of either acceptance or rejection. Rejected manuscripts are returned by regular mail. Accepted manuscripts become the property of the *Journal* and are not returned. The *Journal* is not responsible for loss of manuscripts through circumstances that are beyond its control.

Manuscripts should be addressed to Editor, *Maryland State Medical Journal*, 1211 Cathedral St, Baltimore MD 21201.

SPECIFICATIONS: Manuscripts must be original typed copy, doublespaced throughout (including text, case reports, legends, tables and references) with margins of at least one inch. Pages should be numbered consecutively.

The manuscript should include the title (brief and concise), the full name of the author (or authors) with degrees, academic and professional titles, affiliations and any institutional or other credits. Please include a complete address where the author may receive proofs for approval and corrections.

The author should retain copy of the manuscript for his/her records.

TABLES: Each table should be typed on a separate sheet of paper, be numbered, have a brief descriptive title and its position in the text should be indicated. The Editor reserves the right to edit the tables. Be sure that statistics are consistent in both tables and text.

REFERENCES: References should be limited to those citations noted in the text. A complete review of the literature is rarely desirable. References must be typed doublespaced and are to be numbered consecutively as they appear in the text, with their positions in the text indicated. An alphabetized bibliography is used only when the listing is of books suggested for supplementary reading.

All references must be checked for absolute accuracy. Each journal reference must include author(s) and initials, complete title of article, name of publication, volume, first page of article and date. Complete dates (month, day and year) are to be included with all references that have appeared within the last three years. Include with book references name of author(s)

and/or editor(s) with initials, title of book, edition, location, publisher year, volume (if given) and page. If reference is to a chapter within a book, include the author of the chapter (if different from author of the book) and the title of the chapter, if any. References should be listed consecutively, both in text and listing.

ILLUSTRATIONS: Authors are urged to use the services of professional illustrators and photographers when possible. Drawings and charts should always be done in black ink on white paper. Clear, glossy photographs, black and white, should be submitted and such illustrations numbered consecutively and their positions indicated in the text.

Please do not deface an illustration by writing on the front or back UNLESS it is done lightly with a grease pencil or so lightly that the imprint will not register through to the front. The figure number and author's name will suffice.

Legends for illustrations should be typewritten on a separate page with numbers corresponding to those on the photographs and drawings. The Editor reserves the right to limit the number of photographs used.

Recognizable photographs of patients are to be masked and should carry with them written permission for publication.

EDITORIAL RESPONSIBILITY: Manuscripts are subject to editorial modification and such revisions as are necessary to bring them into conformity with *Journal* style.

A set of galley proofs will be provided the principal author and, if not returned by the specified date, will be considered approved as type-set.

Statements made or opinions expressed by any contributor in any article or feature published in the *Journal* are the sole responsibility of the author.

PERMISSIONS: When material is reproduced from other sources, full credit must be given to both the author and publisher and written permission from these sources must be included when the material is submitted.

COPYRIGHT: Material that is published in the *Maryland State Medical Journal*, is protected by copyright and may not be reproduced without the written permission of both the author and the *Journal*. ☐

INTERNIST (B.C. or B.E.)— PRIMARY CARE

- 414 bed community teaching hospital, established 1854
- \$32 million new facility
- Community Health Center
- Community Outreach Program
- Excellent salary and benefits

We are seeking a physician to provide primary care in an ambulatory setting, to be involved in teaching of residents and medical students and to participate in the administration of hospital outpatient activities.

Direct inquiries to:

McRae W. Williams, M.D.
Chief, Ambulatory Care and Community Medicine
The Union Memorial Hospital

The Great Laxative Escape

COLACE

dioctyl sodium sulfosuccinate

Colace means escape—from laxative stimulation, from laxative harshness, from laxative habit. Colace gently helps soften stools for easy, painless, unstrained elimination. It's the great laxative escape, from infancy to old age. Available in 100 and 50 mg. capsules. Syrup or liquid.

maintained on**

QUIBRON[®]

Each capsule or tablespoonful (15 ml) liquid contains theophylline (anhydrous) 150 mg and glyceryl guaiacolate (guaifenesin) 90 mg

- theophylline for effective around-the-clock bronchodilator therapy
- 100% free theophylline

Indications: For the symptomatic relief of bronchospastic conditions such as bronchiol asthma, chronic bronchitis, and pulmonary emphysema.

Warnings: Do not administer more frequently than every 6 hours, or within 12 hours after rectal dose of any preparation containing theophylline or aminophylline. Do not give other compounds containing xanthine derivatives concurrently.

Precautions: Use with caution in patients with cardiac disease, hepatic or renal impairment. Concurrent administration with certain antibiotics, i.e., clindamycin, erythromycin, troleandomycin, may result in higher serum levels of theophylline. Plasma prothrombin and factor V may increase, but any clinical effect is likely to be small. Metabolites of guaifenesin may contribute to increased urinary 5-hydroxyindoleacetic acid readings, when determined with nitrosonaphthol reagent. Safe use in pregnancy has not been established. Use in case of pregnancy only when clearly needed.

Adverse Reactions: Theophylline may exert some stimulating effect on the central nervous system. Its administration may cause local irritation of the gastric mucosa, with possible gastric discomfort, nausea, and vomiting. The frequency of adverse reactions is related to the serum theophylline level and is not usually a problem at serum theophylline levels below 20 mcg/ml.

How Supplied: Capsules in bottles of 100 and 1000 and unit-dose packs of 100; Liquid in bottles of 1 pint and 1 gallon.

See package insert for complete prescribing information.

ROCHE

For recurrent attacks of urinary tract infection in women

Bactrim™ DS Double Strength Tablets

Each tablet contains 160 mg trimethoprim and 800 mg sulfamethoxazole.

Just one tablet b.i.d. for 10 to 14 days

- Action at urinary/vaginal/lower bowel sites helps eliminate reservoirs of infecting organisms
- Distinctive antibacterial action plus wide spectrum helps eradicate recurrent UTI
- Low incidence of bacterial resistance in community practice

- Convenient *b.i.d.* dosage provides day-and-night antibacterial control
- Contraindicated during pregnancy and the nursing period. During therapy, maintain adequate fluid intake; perform CBC's and urinalyses with microscopic examination.

Before prescribing, please consult complete product information, a summary of which follows:

Indications and Usage: For the treatment of urinary tract infections due to susceptible strains of the following organisms: *Escherichia coli*, *Klebsiella-Enterobacter*, *Proteus mirabilis*, *Proteus vulgaris*, *Proteus morganii*. **It is recommended that initial episodes of uncomplicated urinary tract infections be treated with a single effective antibacterial agent rather than the combination.** Note: The increasing frequency of resistant organisms limits the usefulness of all antibacterials, especially in these urinary tract infections.

Also for the treatment of documented *Pneumocystis carinii* pneumonitis. To date, this drug has been tested only in patients 9 months to 16 years of age who were immunosuppressed by cancer therapy.

The recommended quantitative disc susceptibility method (*Federal Register*, 37:20527-20529, 1972) may be used to estimate bacterial susceptibility to Bactrim. A laboratory report of "Susceptible to trimethoprim-sulfamethoxazole" indicates an infection likely to respond to Bactrim therapy. If infection is confined to the urine, "Intermediate susceptibility" also indicates a likely response. "Resistant" indicates that response is unlikely.

Contraindications: Hypersensitivity to trimethoprim or sulfonamides; pregnancy; nursing mothers; infants less than two months of age.

Warnings: Deaths from hypersensitivity reactions, agranulocytosis, aplastic anemia and other blood dyscrasias have been associated with sulfonamides. Experience with trimethoprim is much more limited but occasional interference with hematopoiesis has been reported as well as an increased incidence of thrombopenia with purpura in elderly patients on certain diuretics, primarily thiazides. Sore throat, fever, pallor, purpura or jaundice may be early signs of serious blood disorders. Frequent CBC's are recommended; therapy should be discontinued if a significantly reduced count of any formed blood element is noted.

Precautions: Use cautiously in patients with impaired renal or hepatic function, possible folate deficiency, severe allergy or bronchial asthma. In patients with glucose-6-phosphate dehydrogenase deficiency, hemolysis, frequently dose-related, may occur. During therapy, maintain adequate fluid intake and perform frequent urinalyses, with careful microscopic examination, and renal function tests, particularly where there is impaired renal function.

Adverse Reactions: All major reactions to sulfonamides and trimethoprim are included, even if not reported with Bactrim. **Blood dyscrasias:** Agranulocytosis, aplastic anemia, megaloblastic anemia, thrombopenia, leukopenia, hemolytic anemia, purpura, hypoprothrombinemia and methemoglobinemia. **Allergic reactions:** Erythema multiforme, Stevens-Johnson syndrome, generalized skin eruptions, epidermal necrolysis, urticaria, serum sickness, pruritus, exfoliative dermatitis, anaphylactoid reactions, periorbital edema, conjunctival and scleral injection, photosensitization, arthralgia and allergic myocarditis. **Gastrointestinal reactions:** Glossitis, stomatitis, nausea, emesis, abdominal pains, hepatitis, diarrhea and pancreatitis. **CNS reactions:** Headache,

peripheral neuritis, mental depression, convulsions, ataxia, hallucinations, tinnitus, vertigo, insomnia, apathy, fatigue, muscle weakness and nervousness. **Miscellaneous reactions:** Drug fever, chills, toxic nephrosis with oliguria and anuria, periarteritis nodosa and L. E. phenomenon. Due to certain chemical similarities to some goitrogens, diuretics (acetazolamide, thiazides) and oral hypoglycemic agents, sulfonamides have caused rare instances of goiter production, diuresis and hypoglycemia in patients; cross-sensitivity with these agents may exist. In rats, long-term therapy with sulfonamides has produced thyroid malignancies.

Dosage: Not recommended for infants less than two months of age.

Urinary Tract Infections: Usual adult dosage—1 DS tablet (double strength), 2 tablets (single strength) or 4 teasp. (20 ml) b.i.d. for 10-14 days.

Recommended dosage for children—8 mg/kg trimethoprim and 40 mg/kg sulfamethoxazole per 24 hours, in two divided doses for 10 days. A guide follows:

Children two months of age or older:

Weight		Dose—every 12 hours	
lbs	kgs	Teaspoonfuls	Tablets
20	9	1 teasp. (5 ml)	½ tablet
40	18	2 teasp. (10 ml)	1 tablet
60	27	3 teasp. (15 ml)	1½ tablets
80	36	4 teasp. (20 ml)	2 tablets or 1 DS tablet

For patients with renal impairment:

Creatinine Clearance (ml/min)	Recommended Dosage Regimen
Above 30	Usual standard regimen
15-30	½ the usual regimen
Below 15	Use not recommended

***Pneumocystis carinii* pneumonitis:** Recommended dosage: 20 mg/kg trimethoprim and 100 mg/kg sulfamethoxazole per 24 hours in equal doses every 6 hours for 14 days. See complete product information for suggested children's dosage table.

Supplied: Double Strength (DS) tablets, each containing 160 mg trimethoprim and 800 mg sulfamethoxazole, bottles of 100; Tel-E-Dose® packages of 100. Tablets, each containing 80 mg trimethoprim and 400 mg sulfamethoxazole—bottles of 100 and 500; Tel-E-Dose® packages of 100; Prescription Paks of 40, available singly and in trays of 10. Oral suspension, containing in each teaspoonful (5 ml) the equivalent of 40 mg trimethoprim and 200 mg sulfamethoxazole, fruit-licorice flavored—bottles of 16 oz (1 pint).

ROCHE

Roche Laboratories
Division of Hoffmann-La Roche Inc.
Nutley, New Jersey 07110

Please see back cover.

Her next attack of cystitis may require

the BactrimTM 3-system counterattack

ROCHE

Bactrim has shown high clinical effectiveness in recurrent cystitis as a result of its wide spectrum and distinctive antimicrobial action in the urinary, vaginal and lower intestinal tracts.

The probability of recurrent urinary tract infection appears to be enhanced by the establishment of large numbers of *E. coli* or other urinary pathogens on the vaginal introitus. The trimethoprim component of

Bactrim diffuses into vaginal fluid in effective concentrations, thus combating migration of pathogens into the urethra.

Studies have shown that Bactrim acts against *Enterobacteriaceae* in the bowel without the emergence of resistant organisms. Thus, Bactrim reduces the risk of introital colonization by fecal uropathogens. It has *no* significant effect on other normal, necessary intestinal flora.

Bactrim fights uropathogens in the urinary tract/vaginal tract/lower intestinal tract

Please see reverse side for summary of product information.

Are Billing and Receivables Important to You?

CAS means: **effective patient** **account management**

CAS Provides a "Results" System Tailored to Your Needs

- is designed specifically for group practice management needs;
- is user-controlled and directed for assured accuracy and efficiency;
- can be effectively operated by non-technical administrative personnel;
- provides fast, accurate, reliable billing to all parties;
- provides automatic rebilling and collection follow-up;
- issues timely and effective practice activity reports;
- is kept up-to-date by professional group practice managers;
- improves cash flow;
- increases total collections;
- is fully confidential.

CAS' Staff are experienced Group Practice Managers! We are available for management consultation. We monitor the business practice issues especially those related to third party payors and government units. This monitoring makes it possible for CAS to implement carefully thought-out plans rather than reacting to unnecessary crises.

Our pricing structure is based on our performance and is very competitive; you only pay for the bills, statements and reports produced. We depend on our performance which assures you

peace-of-mind. The CAS System pays for itself!

Headquartered in Baltimore, CAS effectively serves this region by providing its computerized system as a tool for your management or by providing total patient account management services.

For the best results from patient account management, enter into a CAS partnership. Call or write for a free brochure.

I would like more information about how CAS can make my patient account management task easier:

7% of the population may be harboring latent or dormant tuberculosis*

**Are you testing for it during
routine office physicals?**

*Based on a national estimate of 15 million tuberculin reactors
Stead, W.W. and Bates, J., in Harrison's Principles of Medicine,
8th Edition, 1977, McGraw-Hill, p. 900.

LEDERLE Tuberculin, Old

✓ TINE TEST®

An important check in every checkup.

A system, not just a test — supplied with patented induration indicator cards in English or Spanish — simplifies recording and record keeping.

- Over 15 years of use — millions of tests performed each year.
- Practical and easy to perform — presterilized; disposable; no refrigeration needed; no needles or syringes.
- Fast — only seconds to perform — can be read in 48-72 hours.

Precautions: Tuberculin testing should be done with caution in persons with active tuberculosis. However, activation of quiescent lesions is rare.

Although clinical allergy to acacia is very rare, this product contains some acacia as a stabilizer and should be used with caution in patients with known allergy to this component. Reactivity to the test may be suppressed in patients who are receiving corticosteroids or immunosuppressive agents, or those who have recently been vaccinated with live virus vaccine such as measles.

With a positive reaction, further diagnostic procedures must be considered. These may include x-ray of the chest, microbiologic examinations of sputa and other

specimens, and confirmation of the positive TINE TEST using the Mantoux method. In general, the TINE TEST does not need to be repeated. Antituberculous chemotherapy should not be instituted solely on the basis of a single positive TINE TEST.

Adverse Reactions: Vesiculation, ulceration, or necrosis may occur at the test site in highly sensitive persons. Pain, pruritus and discomfort at the test site may be relieved by cold packs or by a topical glucocorticoid ointment or cream. Transient bleeding may be observed at a puncture site and is of no significance.

Reference: Diagnostic Standards and Classification of Tuberculosis. National Tuberculosis and Respiratory Disease Association, N.Y. 1969.

Lederle LEDERLE LABORATORIES DIVISION, American Cyanamid Company, Pearl River, New York 10965

For \$780, you can dress up a whole room with furniture you can't wear out.

At This End Up you can buy a roomful of extraordinary furniture for less than you'd

normally pay for a couch.

For the price above you get everything pictured above, plus the assurance that even though the price is reasonable, it doesn't require any sacrifice in terms of quality.

All six pieces are solid, natural, all wood. And they're practically indestructible because they contain no plywood, no veneer and no moving parts.

You see, we think the last word in furniture is furniture that lasts.

This End Up

Furniture you can put your feet on.

When the indications surface...

Net wt 1 oz

Net wt 1/2 oz

Net wt 1/32 oz
(approx)

NEOSPORIN[®] Ointment

(Polymyxin B-Bacitracin-Neomycin)

Burroughs Wellcome Co.
Research Triangle Park
North Carolina 27709

Each gram contains: Aerosporin[®] (Polymyxin B Sulfate) 5,000 units, bacitracin zinc 400 units, neomycin sulfate 5 mg (equivalent to 3.5 mg neomycin base), special white petrolatum qs; in tubes of 1 oz and 1/2 oz and 1/32 oz (approx.) foil packets.

INDICATIONS: *Therapeutically*, (as an adjunct to systemic therapy when indicated), for topical infections, primary or secondary, due to susceptible organisms, as in: infected burns, skin grafts, surgical incisions, otitis externa; primary pyodermas (impetigo, ecthyma, sycosis vulgaris, paronychia); secondarily infected dermatoses (eczema, herpes, and seborrheic dermatitis); traumatic lesions, inflamed or suppurating as a result of bacterial infection. *Prophylactically*, the

ointment may be used to prevent bacterial contamination in burns, skin grafts, incisions, and other clean lesions. For abrasions, minor cuts and wounds accidentally incurred, its use may prevent the development of infection and permit wound healing.

CONTRAINDICATIONS: This product is contraindicated in those individuals who have shown hypersensitivity to any of its components. Do not use in the eyes or in the external ear canal if the eardrum is perforated.

WARNING: Because of the potential hazard of nephrotoxicity and ototoxicity due to neomycin, care should be exercised when using this product in treating extensive burns, trophic ulceration and other extensive conditions where absorption of neomycin is possible. In burns where more than 20 percent of the body surface is affected, especially if the patient has impaired renal function or is receiving other aminoglycoside antibiotics concurrently, not more than one application a day is recommended.

When using neomycin-containing products to control

secondary infection in the chronic dermatoses, it should be borne in mind that the skin is more liable to become sensitized to many substances, including neomycin. The manifestation of sensitization to neomycin is usually a low grade reddening with swelling, dry scaling and itching; it may be manifest simply as failure to heal. During long-term use of neomycin-containing products, periodic examination for such signs is advisable and the patient should be told to discontinue the product if they are observed. These symptoms regress quickly on withdrawing the medication. Neomycin-containing applications should be avoided for that patient thereafter.

PRECAUTIONS: As with other antibacterial preparations, prolonged use may result in overgrowth of nonsusceptible organisms, including fungi. Appropriate measures should be taken if this occurs.

ADVERSE REACTIONS: Neomycin is a not uncommon cutaneous sensitizer. Articles in the current literature indicate an increase in the prevalence of persons allergic to neomycin. Ototoxicity and nephrotoxicity have been reported (see Warning section).

Complete literature available on request from Professional Services Dept. PML.

NOW effective June 1 **MONEY MARKET CERTIFICATES**

yield $1\frac{1}{4}\%$ more than the average
rate on 6 month U.S. Treasury Bills

Money Market Certificates from Arlington Federal are similar to a 6-month Treasury Bill except they pay $1\frac{1}{4}\%$ more than the average discount rate in the most recent weekly auction on 6-month Treasury Bills. For example, if the last Treasury Bill auction in May results in an average yield of 7.16%, our Money Market Certificate available on June 1 would have a rate of 7.41% per annum. These Certificates will be issued in minimum denominations of \$10,000, with a 6-month (26-week) maturity. There is a substantial penalty for early withdrawal.

also **8% SAVING
CERTIFICATES**
(effective annual yield 8.33%)

You can invest in these Saving Certificates in minimum denominations of \$1,000 and receive an 8% dividend compounded annually to 8.33%. The Certificates mature in 8 years. For investors who wish a long-term, high-yield Certificate insured up to \$40,000 by the Federal Savings and Loan Corporation, this is an unusual opportunity. There is a substantial penalty for early withdrawal. Stop in at any one of our convenient offices and ask about these new Certificates that are being offered for the first time on June 1.

The Open Forum

From Dr. Solomon . . .

To the Editor:

With a great sense of pride, but with a feeling of genuine sadness, I have resigned from the position of Secretary of Health and Mental Hygiene, effective Jan. 16, 1979.

This should come as no surprise, since I stated in an interview in the *Journal* in January, 1978 that I would be leaving office prior to the inauguration of the new Governor. I reiterated this in a public statement which I issued on Sept. 16, 1978.

In leaving public office, I will have more time to devote to my private practice in helping people who want to lose weight, to my writing and to spending more time with my family. This is not to say that I shall not continue my interest in public health and with the delivery of health care. It is my intention to speak out "loud and clear" on these matters, perhaps even with a frankness that public office sometimes inhibited.

I am well aware that at times my stewardship has been controversial. I was not controversial for the sake of controversy, but because I felt strongly that health problems should be brought to the public so solutions could be forthcoming.

In other words, I was sensitive enough to care, but tough enough to fight. Never have I attempted to conduct a popularity contest, but have attempted to move programs along that would help all the people and that I would not be a pawn of any special interest or pressure group.

Perhaps I have received the greatest criticism for appearing on television. The local production, *Prescription for Family Health*, was, in my opinion, an excellent medium for health education. I would hope that something similar would again be aired. These programs brought to a Maryland viewing audience information that simply was not available elsewhere. The national television shows on which I appeared, all on my own time, brought to the state valuable publicity of a positive nature. My books also nurtured good medical

practice which was helpful to the state's image. The fact that certain elements of the press seemed to take an almost sadistic delight in being critical, has not altered my opinion that I have always acted in the best interest of the people of our state.

The much-publicized Dewberry Report, requested by Gov. Marvin Mandel, stressed only the negative aspects of the Department of Health and Mental Hygiene and neglected its many, many accomplishments. This may have been the mission of the Committee, but I frankly found it distasteful, as did many of my colleagues. The Report did, however, have its positive results, in that it reinforced our desire to expedite a continuing self-evaluation and brought about organizational changes which have improved the functioning of the Department.

The Department has, in my opinion, made remarkable progress since its creation in July, 1969, at which time I became Secretary.

The Department's staff is highly professional and devoted to serving the people of Maryland. I know that the new Secretary will find a group of individuals who are well-qualified and equipped to handle the multitude of programs and equally well-equipped to face the problems of the future.

The bringing together of a number of previously-independent Departments into a single umbrella agency was a monumental task, but I think this transition has been accomplished with a minimum of difficulty, and that the real purpose of the Cabinet system of government has been achieved. As to be expected, there were growing pains and, perhaps, the Department moved too quickly in centralizing its activities, but as an end result, the people of our state have been well-served.

Today, there is a close working relationship between local Health Departments, local Health Officers and the Headquarter's staff of the Department. The "Maryland Public Health Team" is nationally-recognized as one of the strongest, if not the strongest, in the nation.

I am particularly proud of the gains made in the area of environmental health and the progress that has been made in reducing pollution of the air and water and in controlling problems for the disposal of solid waste.

Community programs dealing with mental hygiene, mental retardation and juvenile services have been accelerated.

I am gratified by the current leadership team in mental hygiene. These officials have brought a new outlook to the State's mental health program, with the recruitment of well-qualified individuals to work with the community, as well as keeping the Department's residential programs up to a reasonable standard.

In the field of mental retardation, a total, new emphasis has been applied. The previous medical model has been altered so that emphasis now has been placed on special education and training, permitting

DR. SOLOMON (left) being interviewed in late 1977 for the *Journal's* January, 1978 cover story by Managing Editor Blaine Taylor. (Photo by Claude Brooks.)

the mentally-retarded to function at their highest possible level. Previously unacceptable conditions in some of the State's institutions, primarily Rosewood, have been corrected or are in the process of being corrected.

The programs dealing with preventive medicine, the aged and chronically-ill, laboratories and local health deserve special commendation.

The Department has won national acclaim for its progress in immunization against childhood diseases, aid for crippled children and proper nutrition for mothers and young children.

The Laboratory, in its new quarters on Preston St. in Baltimore, is one of the finest in the nation, turning out quality work, a hallmark for the rest of the country.

The Administration for Services to the Chronically-Ill and Aged has likewise expanded its programs to be of greater service, has upgraded its residential institutions and through its Geriatric Evaluation Program has been of greater assistance in the proper placement of the elderly.

Skillful programming and careful attention to appropriate administrative practices have enhanced the programs for drug abusers and those with alcoholism. These programs also have a close linkage with local groups and agencies.

Significant progress has likewise been made in dealing with juvenile offenders; not that we have reached the ultimate solution to this ever-present situation, but I believe the philosophy of rehabilitation is vastly superior to one of punishment and retaliation. The Department's stand in opposing a juvenile prison was one I am particularly proud of and it is my belief that the money which would have been wasted on such an institution is now being better-utilized in community programs.

The Medicaid program, which accounts for approximately one-half of the Department's budget, has been effectively managed with greatly-improved administrative procedures. This program provides medical care for approximately 400,000 of the state's poor and elderly, playing a major role in the State's system of delivery of health care.

Also worthy of note is the Department's program to upgrade the quality of care in nursing homes with more frequent and more effective inspections.

In looking to the future, the State and nation face numerous health problems which will require the best thinking and talents of our people. With some type of National Health Insurance looming on the horizon, it is incumbent upon all segments of the health industry to work together to provide an effective system at a cost that the nation can afford.

The ever-increasing escalation of health costs is a facet of the nation's economy in need of prompt and meaningful attention. Up until now, cost containment has been done in a piecemeal fashion without the coordination and public mandate that it really needs.

Within the state, its citizens must realize that resources are still not available to meet the pressing needs of multi-leveled programs embraced by the Department. If we are to reach our objective of quality

health care for all Marylanders, these additional resources must be made available.

If requested, I also intend to offer my full cooperation to the new Secretary and to the new State government. Gov. Hughes, as a former Cabinet Secretary, is well aware of the problems of bureaucracy and I am certain that he will deal with these problems in a practical and effective manner.

ISRAEL COHEN
PRESIDENT AND
CHIEF EXECUTIVE OFFICER

March 8, 1979

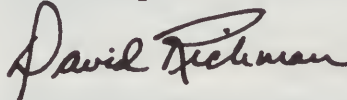

Dear Doctor:

As you no doubt know, with certain restrictions, present Maryland law allows pharmacists to interchange generic prescription drugs for many branded products.

In order to avoid those situations in which you learn that patients of yours have received generic drugs when it may not have been your intention, we are enlisting your cooperation to eliminate such occurrences. In accordance with the new law, all you need do is expressly indicate on the prescription those instances in which you do not want substitution to occur. This merely takes a notation on the prescription such as "N.S." (No Substitution) or "D.A.W." (Dispense As Written) or some obvious instruction. Although we want to save your patients money by dispensing generic drugs when possible, we will always comply with your wishes.

If you have any questions, please feel free to contact your nearest Giant Pharmacy or if you prefer, call me on (301) 341-4133.

Sincerely,

David Richman, Ph.D., R.Ph.
Director of Quality Assurance

M.H. Bortnick, B.S., R.Ph.

In Memoriam

Whitmer B. Firor, MD, 1902-79

Dr. Whitmer Bennett Firor, 76, the Faculty's President during 1960-61, died Jan. 18, 1979 at his Baltimore home after a long illness. Former Chief of Radiology at Baltimore's Union Memorial Hospital, Dr. Firor was also a former President of the Baltimore City Medical Society (1958).

One of the country's best-known specialists in his field, Dr. Firor was Assistant Professor of Radiology at the Johns Hopkins Medical School and served as Associate Editor of the *Year Book of Radiology* for 15 years. He also was the author of many papers in his professional field.

He served at various times as Chief of Radiology at the Sheppard and Enoch Pratt Hospital and the Women's Hospital, which is now part of the Greater Baltimore Medical Center. He also served on the staff of Children's Hospital in Baltimore.

Dr. Firor was a former member of the Medical Board for Occupational Diseases, which hears such cases for the State Workmen's Compensation Commission.

A graduate of the Johns Hopkins University, where he obtained a BA degree in 1923, and the Hopkins Medical School in 1927, he practiced his specialty here for nearly 35 years, retiring in 1974.

Born Apr. 23, 1902 in Scranton, PA, Dr. Firor was a son of the Rev. Marion L. Firor and Anna Percival Firor. The family later moved to Maryland and he grew up in Thurmont, in Frederick County.

As a young man, he played the violin. Although not an active musician in later years, he retained his interest in classical music and attended concerts regularly.

After obtaining his MD degree at Hopkins, Dr. Firor served his internship at the Henry Ford Hospital in Detroit, and his residency at the University of Michigan Hospital. While a resident, he was a University of Michigan Fellow in Radiology during 1929 and part of 1930, the year he moved to Baltimore and entered private practice.

Dr. Firor served in the Army Medical Corps during World War II, rising to the rank of Colonel, and was assigned to the 118th General Hospital, a Hopkins unit, at Ft. Meade in 1945 and part of 1946, after his return from the Philippines. He also served in Australia and

New Guinea.

He was a member of the Maryland and Elkridge Clubs, the American Medical Association and the American Roentgen Ray Society.

Married in 1928 to a Canadian nurse at Hopkins, Mildred Isabelle Conley, Dr. Firor fathered a son, Whitmer B. Firor, Jr., MD of Saskatoon, Sask., and three grandchildren.

The late Dr. Firor was also a man of humor, as evidenced by a handwritten note at the end of an autobiographical sketch penned for Med-Chi files: "Take this, add salt, boil, simmer down to proper level."—BT.

ANNUAL

MEETING

INFO

No resolutions were received in the Faculty office by Friday, March 16, the deadline for receipt of resolutions. Therefore, there will be no Reference Committee meeting nor will there be a report of this committee presented to the House of Delegates at the annual session.

Reports in the mail to Delegates, Alternate Delegates, component society officials and officers of the Faculty include the Bylaws Committee report, containing various minor bylaw amendments. Along with this is a tentative agenda for the House of Delegates sessions on Wednesday, May 2 and Saturday, May 5. The length of the scientific programs this year requires a meeting of the House of Delegates on Saturday.

The annual Presidential Banquet will be held on Friday evening, May 4, marking the close of the scientific programming and other activities.

SEMIANNUAL

MEETING DATES

The Faculty's Semiannual Scientific Meeting will be held in New Orleans, Louisiana, from September 12 to September 16, 1979. The House of Delegates session will be held in Baltimore on Saturday, September 29, at the Faculty Building.

LEGISLATIVE

ACTIVITY

The 1979 General Assembly session will adjourn at midnight, Monday, April 9, with over 1,812 House bills and over 1,122 Senate bills having been introduced. The Faculty's legislative agents followed over 300 of these bills.

Testimony was presented in support or opposition to over 100 of these bills, with either the legislative agents or Faculty officials speaking on the issues raised.

The Faculty worked closely with statewide specialty societies in presenting its testimony. An expression of thanks goes to those members who willingly contacted their Delegates and Senators on issues before the General Assembly, when requested to do so by the Faculty.

HUMANITIES

SEMINAR

April 16 is the deadline date for receipt of applications from physicians and others seeking to participate in the Humanities Seminars. These sessions are tuition free and carry with them a \$1,200 stipend to cover expenses. Details can be obtained through the Faculty office.

STATE SOCIETY

DUES

A recent study by the AMA reveals that Maryland ranks 40th in the amount of state society dues. The figures, based on 1979 dues structures, show a high of \$420 in the District of Columbia and a low of \$100 in Connecticut. The dues median for 1979 is \$200. Sixteen state societies increased their dues in 1979 ranging from a 20% increase to a 67% increase. The District of Columbia jumped to first place in dues amounts from sixth in 1978.

Maryland's dues are \$160 plus a \$10 assessment for the building fund, which is assessed for a set period of time only, on each new member.

JCAH

SURVEY

SCHEDULED

JCAH surveys are scheduled for the period of April through June, 1979, of the following hospitals:

Baltimore City Hospital
GBMC
Johns Hopkins Hospital
Sinai Hospital.

Any individual aware of "problem" situations at any of these institutions is requested to communicate with the JCAH on the subject. Data should be sent to John E. Milton, Deputy Director, Hospital Accreditation Program, 875 North Michigan Avenue, Chicago, Illinois, 60611, telephone (312) 642-6061.

HISTORICAL

TRIVIA

When telephones were first developed and became a means of communication in the Baltimore area, the Faculty was assigned the three-digit number 872. When exchanges came along, the Faculty was assigned 9-0872; and finally, when three digit prefix numbers came into use, the Faculty was designated 539-0872. The Faculty has retained the same telephone number ever since it was first assigned.

MOCK

ARBITRATION

SYMPOSIUM

A mock arbitration symposium will be held on Thursday, June 7, 1979, from 7 to 10 PM in the Freshman Lecture Hall at the University of Maryland School of Medicine, in cooperation with the University of Baltimore, MICPEL, School of Law, the University of Maryland School of Medicine and the Health Claims Arbitration office. Anyone interested in participating may contact the Faculty office for further details. The registration fee is unknown at this time.

JOHN SARGEANT, CAE, Executive Director

Council

The Council met on Jan. 25, 1979 and took the following actions:

1. Observed a moment's silence in memory of M. McKendree Boyer, MD, of Damascus, MD and C. Willard Camalier, MD, of Washington, DC, both of whom died since the last Council session. Also adopted motions of appreciation for the time and effort of these physicians in serving the profession and the public.

2. Granted 1979 dues waivers for two physicians on account of illness.

3. Approved changing the September, 1979 Council meeting date from the 22nd to the 29th, to avoid a Jewish holiday on the previous date.

4. Rereferred two recommendations to the Committee on Preventive Medicine and Public Health dealing with 1) banning the use of trampolines in schools and 2) utilizing EMTs at scholastic sports events. Both recommendations involve obtaining additional information and clarification.

5. Accepted a report from the Med-Chi Insurance Trust regarding insurance coverage for emotional illness and instructed the Trust to offer this supplemental coverage to participants in the Med-Chi programs.

6. Approved a list of nominees for submission to Maryland Blue Shield for consideration of its Nominating Committee.

7. Adopted a revision in personnel policies dealing with overtime. The addition is as follows:

Overtime: Overtime is required of employees as necessary.

Compensatory time off or wages, in accordance with Federal laws, will be provided for non-exempt employees only.

When an exempt employee works overtime exceeding three hours beyond normal working hours, reimbursement will be made for any expenses incurred for meals. Such reimbursement will be on the basis of actual expenses incurred up to a maximum of \$12.50 for dinner.

Travel expenses: When employees are traveling on Faculty business, reimbursement for meals not included in the meeting registration fee will be made on the basis of a maximum of \$25 per day. This maximum is computed on the basis of \$5 for breakfast, \$5 for lunch and \$15 for dinner. All expenses must be itemized indicating which, if any, meals were included in the meeting registration fee.

8. Approved a site for the 1980 Semiannual Meeting, but then reversed the decision, asking the Program and Arrangements Committee to consider other locations

and dates for recommendation to the Council.

9. Adopted the budget for 1979.

10. Recognized the following physicians for their lengthy and devoted service on the Peer Review Committee:

Katherine H. Borkovich, MD

Edward J. Kowalewski, MD

11. Authorized the President to name an Ad Hoc Committee to review present payment policies by health insurers wherein they pay a facility fee for service only when rendered in a hospital. Common sense would indicate that total payments under such a program could be reduced if a facility fee were available to encourage physicians carrying out such procedures in an office setting.

12. Rejected the concept of establishing a counter-suit fund which would finance countersuits against attorneys who file non-meritorious claims against physicians.

13. Approved expenditure of \$975 to underwrite costs of radio talk shows by physicians over WBJC-FM, for an additional 14 weeks.

14. Endorsed the following health status goals as suggested by the Central Maryland HSA:

Objective #1: To reduce the deaths from cirrhosis from 16.8 per 100,000 to 15 per 100,000 by 1981 and maintain that level of decline.

Objective #2: To reduce the morbidity of alcohol abuse as measured by hospital admissions for alcohol.

Objective #3: To reduce the morbidity for alcohol abuse as measured by hospital admissions for alcohol intoxicification.

Objective #4: To reduce the incidence of fetal alcohol syndrome.

Objective #5: To reduce the number of alcohol-related traffic deaths.

Objective #6: To reduce incidence of alcohol-related child abuse.

15. Referred to the Health Planning Committee a question raised by the Central Maryland HSA that would require hospitals to provide educational programs on alcoholism, with mandatory attendance by physicians and other health personnel. The Committee will consider and report to the Council on this subject.

Executive Committee

The Executive Committee met Feb. 8, 1979 and took the following actions:

1. Deferred action on a suggestion the Statewide PSRO Council involve itself in the review of in-hospital patient care quality, until such time as the Chairman of this Council could be heard from.

2. Received an update on the Faculty's negotiations in connection with proposed regulations involving Nurse/Practitioners, Nurse/Midwives and Nurse/Anesthetists.

3. Declined to make a contribution to the Johns Hopkins Medical School Chapter of the American Medical Student Association for sending representatives of this group to its national meeting in Denver, CO

Maryland Hospital Association Speaking of Hospitals

RICHARD J. DAVIDSON, Editor

Maryland Hospitals Second in the Nation in Controlling Inflation

Maryland hospitals are second in the nation (behind New York State) in the fight to control inflation of hospital costs, according to recently-released statistics from the Chicago-based American Hospital Association. In 1977, Maryland hospitals had the lowest rate of increase in hospital costs of the 50 states. Preliminary estimates indicate the trend will continue in 1979.

The 1977 statistics indicate that Maryland hospitals' expenses increased 9.27% compared with a nationwide average increase of 13.9%. This can be translated as a rise in expenses per patient day from \$171.47 in 1976 to \$187.36 in 1977.

Owing to the lower rise in costs in 1977, estimated savings to Marylanders were \$48 million in that year alone. That amount is in excess of \$130,000 savings per day. These savings occurred despite the fact that hospitals employed more people to care for patients in 1977 than in 1976.

In Maryland, expenses per adjusted inpatient day rose 9.27% right behind New York's 8.6%. The national rate of increase was 13.9%.

Richard J. Davidson, President of the Maryland Hospital Association, called the cost trend a dramatic one. "It is unmistakably clear that the citizens of Maryland are the beneficiaries of well-managed hospitals working cooperatively with the Maryland Health Services Cost Review Commission. We have some of the finest hospital managers in the nation running our institutions. We are also fortunate in having an effective and rational

form of payment regulation under the Commission. "In fact, I'd match Maryland's hospitals with those of any other state in the country for their ability to cope with the issue of rising costs."

"The credit for this progress," Davidson pointed out, "should clearly go to the trustees, medical staff and management of each of our hospitals."

In related comments concerning President Carter's recent anti-inflation message to the nation, Davidson called the cost record in Maryland so impressive that "Our state rate review commission and our hospitals' performance could match the goals of any Federal cost containment proposal now being promoted by the Carter Administration."

The Maryland Hospital Association is a statewide, voluntary association of 65 general and special hospitals organized for the purpose of improving hospital service in Maryland through programs of joint action, management efficiency, mutual assistance and cooperation. The Association is a private, nonprofit corporation supported by dues paid by its member institutions. □

Statistics and Surveys

In May, last year, I reported on the reactions of Faculty members to the Library, as indicated in the Faculty's annual survey of 20% of the total membership. Last year's survey had a single question regarding the success of the Library in assisting members in the private practice of medicine. My interpretation of that survey showed that 29% of the members felt that the Library served their needs well or satisfactorily. One per cent were dissatisfied, and 70% offered no opinion. Those who did not respond were placed in the "no opinion" category.

The 1979 survey's question about the Library was expanded to evoke more information. The intent was, first of all, to discern how aware members are of Library services and, secondly, to uncover the reasons that some members do not use the Library.

The Library portion of the questionnaire described the major Library services available to Med-Chi members and asked members to indicate their impressions of each service that they had used. The choices were: "very useful," "adequate" or "unsatisfactory." If members had not made use of the services, they were asked if this was because they were not aware of the Library's services, or for some other reason. Those who checked "other" were asked to comment or specify.

As was done last year, 1,000 questionnaires were sent to members; 294 have returned their questionnaires, 267 with answers to the questions regarding the Library; 208 respondents were aware of the Library and some

of its services; 129 of these had used the Library. Fifty-nine respondents were not aware of the existence of the Library and its services.

Considering just the respondents, we can say that 77.9% are aware of the Library, and 48.3% use it. However, it would be intellectually dishonest and statistically absurd for me to imply that these figures represent the entire membership. The questionnaires that were not returned (70.6%) and the 27 returned questionnaires that did not have answers about the Library make it impossible to apply the results to the total membership.

What then can be said regarding the results of the survey? At least 12.9% (129 out of 1,000) of those surveyed have used the Library. I know from our Library's records that, during 1978, 14.1% of the total Faculty membership called on the Library for assistance at least once. (This, by the way, represented an increase of 38.4% over the number of members who used the Library at least once in 1977.) The closeness of these two figures leads me to believe that most of the Med-Chi members who use the Library and received questionnaires filled out the questionnaires and returned them. If this is so, the impressions of this group (representative of about 20% of the Library's users) should be representative of all Library users. If so, then 14.7% of the Library's users think the Library is "excellent;" 61.7% think it is "very good;" 23.3% consider it "adequate" and .3% are dissatisfied with their contacts with the Library.

This is well and good, but what of the other 87.1% of the membership who evidently do not use the Library? The survey revealed many reasons for not using the Library. How much the comments of the 138 respondents who have not used the Library represent the reactions of the entire membership can only be conjectured. Still, the results are worth examining.

That five of the respondents were aware of the Library, but did not know how to use it, and 59 were totally unaware of it, is a puzzle. Every member received extensive publicity about the Library's services during 1978. Among mailings to every member was a new brochure that gives full details on how to obtain the services of the Faculty Library. In addition, talks by the Faculty Librarian and exhibits and talks by other staff members have emphasized the availability of these services throughout Maryland.

Thirty-one respondents stated that they use local medical libraries, possibly not realizing that the Faculty Library backs up most hospital libraries and that the Faculty Librarian is a consultant to many of them. Thus, these members benefit at least indirectly from the Library's services.

Selected Medical Literature Searches

The following are among the computerized medical literature searches provided to members of Med-Chi during the month of January, 1979:

1. Congenital toxoplasmosis in older children and adults	11	citations.
2. Hospital-based home health care	20	"
3. Standards for quality ambulatory care	34	"
4. Phenacetin abuse and its effect on the kidney	15	"
5. Diet restrictions for pancreatitis	6	"
6. Gardner's syndrome	30	"
7. Hypophosphatemia	41	"
8. Hypsarrhythmia	17	"
9. Medical aspects of the lightning-struck patient	6	"
10. Streptococcus mutans and endocarditis	6	"

If you would like a copy of these searches or would like to have a search on any biomedical topic, call or write the Library.

PINEY NARROWS YACHT SALES

Rte. 50 at Kent Narrows, Chester, Md. 21619 (just 4 miles East of Chesapeake Bay Bridge)

Open Daily, Including Sundays

(D.C.) 261-2570 (Balt) 647-1505 (301) 643-6622

Twenty-seven respondents indicated that they never need to use a medical library; these probably represent most of those who did not respond to the survey, as well as the Faculty as a whole.

In answer to those who question the need for a Library because few members are engaged in research or writing papers, I would point out that the primary purpose of the Faculty Library is to help member physicians in their day-to-day practice. In 1978, the staff answered 8,879 requests from Faculty members. Very few of these were for members doing research or writing papers, and almost all came from practicing physicians and were related to the care of their patients.

The following are typical questions members have asked in the past month: "What is the effect of a respirator on the recordings of Swan-Ganz catheters?" "Send recent articles on acute surgical abdominal emergencies during pregnancy." "Want current information on clinical aspects and treatment of malignant thymoma." "Want a couple of recent articles on surgical intervention in, and medical management of, mitral valve prolapse." The Library receives 30-40 questions like this every day. While in no particular case can I say that a patient's care was changed because of information provided by the Library, I am convinced that some physicians provide better care as a result of their questions to the Library.

Most of you who have read this far are probably already Library users, many of whom have been lavish with praise, both in filling out the survey forms and in

talking with me. You can spread the word about the Library's services among your colleagues. When discussing a difficult or interesting case with other physicians, suggest that they call or write the Library for more information. When a question comes up at a hospital medical staff meeting, suggest asking the Faculty Library to find some information on the topic.

There is no practicing physician who would not benefit from at least one MEDLINE search each month, and an occasional photocopy of a journal article. Simply write or call in your question to the Faculty Library, or talk to the librarian at your hospital.

AN EXTENSION OF HOPE FOR THE ALCOHOLIC

HIDDEN BROOK BEL AIR

Established 1968

We are pleased to announce the opening of Hidden Brook at Warwick. This is a major new enlargement of our capacity for the treatment of alcoholics...an expansion of 20 additional beds to the 39 already at Bel Air. Beautifully situated on the waterfront of the Warwick River near Secretary, Maryland in Dorchester County...the total environment is peaceful and ideally conducive to rehabilitation. The program, philosophy and rates of Hidden Brook at Warwick will be identical and interchangeable in every respect with the program at Hidden Brook, Bel Air. Request our brochure. Write or phone for information.

Developers of these fine Communities

TUFTON FARMS I

Maryland Hunt Cup Area — 8 of 9 Farms sold — remaining
47 acres @ \$155,000

HILL FARM

Falls Rd. @ St. Paul's School — 2 to 9 acre
lots — \$44,000 to \$60,000

KNOX RIDGE

At Falls & Shawan Roads — 2 lots — 5 & 10 acres —
\$47,800 & \$55,000

TUFTON FARMS II

Overlooking Worthington Valley — 4 to 11 acre lots —
\$44,000 to \$55,000

WORTHINGTON HILLSIDE

In Worthington Valley — 2 lots remaining —
5 & 7 acres — \$34,500 and \$36,000

GREENLANDS OF HUNT VALLEY

Overlooking Hunt Valley Golf Course —
1 to 6 acre lots — \$23,900 to \$44,000

FAIRWOOD OF HUNT VALLEY

Adjacent to Hunt Valley Golf Club —
1 to 9 acre lots — \$27,500 to \$38,000

GREENCROFT

Near Hunt Valley Industrial Park — 3 lots remaining —
1 to 6 acres — \$24,500 to \$39,800

BROOKWOOD

Greenspring Ave. @ St. Timothy's School — 1 lot available —
1.7 acres @ \$39,800

SAGAMORE FOREST

Worthington Ave. & Butler Rd. — 1 to 4 acre lots —
\$26,000 to \$37,000

SAGAMORE FOREST II

Section One, just opened — 2 to 5 acres —
\$26,000 to \$34,000

Good communities are the product of careful planning and development — from conception to completion. At Gaylord Brooks Investment Company, we purchase only the most prized parcels of land, many in the Valleys of Baltimore County. Then we work with our planners to make certain that each lot not only surpasses the strict requirements of the county, as well as the specific needs of our prospective homeowners and homebuilders, but also preserves the integrity of our community. We've been doing this for more than fifteen years for hundreds of satisfied lot buyers.

Nothing is left to chance. We constantly check on our engineers and subcontractors to make sure that their performance is up to our demanding standards.

This is why our clients say they have total confidence in working with us. Our business is developing fine communities.

For further information about any of the Gaylord Brooks communities listed, please call **Moore • Matthews Company, Realtors**, at one of the following locations:
Phoenix, 667-1900,
Lutherville, 321-1484,
Roland Park, 323-3060.

PEDIATRIC INDICATIONS*
FOR BACTRIM[®] CONTINUE
TO GROW...

URINARY TRACT
INFECTIONS

PNEUMOCYSTIS
CARINII
PNEUMONITIS

SHIGELLOSIS

ACUTE OTITIS
MEDIA

**Involving susceptible organisms.*

Please see Indications section in summary of product information on last page of this advertisement.

NOW... ROCHE INTRODUCES

NEW CHERRY FLAVOR **BACTRIMTM** **PEDIATRIC** **SUSPENSION**

Each teaspoonful (5 ml) contains
40 mg trimethoprim and 200 mg sulfamethoxazole.

ESPECIALLY FLAVORED
FOR CHILDREN*

Also available: The original fruit-licorice flavor to be prescribed
"Bactrim Suspension." The same active ingredient formulation—the difference is the flavor.

Contraindicated in children under 2 months of age.

Please see summary of product information on following page.

BACTRIMTM

(trimethoprim and sulfamethoxazole)

Before prescribing, please consult complete product information, a summary of which follows:

Indications and Usage: For the treatment of urinary tract infections due to susceptible strains of the following organisms: *Escherichia coli*, *Klebsiella-Enterobacter*, *Proteus mirabilis*, *Proteus vulgaris*, *Proteus morganii*. It is recommended that initial episodes of uncomplicated urinary tract infections be treated with a single effective antibacterial agent rather than the combination. Note: The increasing frequency of resistant organisms limits the usefulness of all antibacterials, especially in these urinary tract infections.

For acute otitis media in children due to susceptible strains of *Haemophilus influenzae* or *Streptococcus pneumoniae* when in physician's judgment it offers an advantage over other antimicrobials. Limited clinical information presently available on effectiveness of treatment of otitis media with Bactrim when infection is due to ampicillin-resistant *Haemophilus influenzae*. To date, there are limited data on the safety of repeated use of Bactrim in children under two years of age. Bactrim is not indicated for prophylactic or prolonged administration in otitis media at any age.

For enteritis due to susceptible strains of *Shigella flexneri* and *Shigella sonnei* when antibacterial therapy is indicated.

Also for the treatment of documented *Pneumocystis carinii* pneumonitis. To date, this drug has been tested only in patients 9 months to 16 years of age who were immunosuppressed by cancer therapy.

Contraindications: Hypersensitivity to trimethoprim or sulfonamides, pregnancy, nursing mothers, infants less than two months of age.

Warnings: BACTRIM SHOULD NOT BE USED TO TREAT STREPTOCOCCAL PHARYNGITIS. Clinical studies show that patients with group A β -hemolytic streptococcal tonsillopharyngitis have higher incidence of bacteriologic failure when treated with Bactrim than do those treated with penicillin. Deaths from hypersensitivity reactions, agranulocytosis, aplastic anemia and other blood dyscrasias have been associated with sulfonamides. Experience with trimethoprim is much more limited but occasional interference with hematopoiesis has been reported as well as an increased incidence of thrombopenia with purpura in elderly patients on certain diuretics, primarily thiazides. Sore throat, fever, pallor, purpura or jaundice may be early signs of serious blood disorders. Frequent CBC's are recommended; therapy should be discontinued if a significantly reduced count of any formed blood element is noted.

Precautions: Use cautiously in patients with impaired renal or hepatic function, possible folate deficiency, severe allergy or bronchial asthma. In patients with glucose-6-phosphate dehydrogenase deficiency, hemolysis, frequently dose-related, may occur. During therapy, maintain adequate fluid intake and perform frequent urinalyses, with careful microscopic examination, and renal function tests, particularly where there is impaired renal function. Bactrim may prolong prothrombin time in those receiving warfarin; reassess coagulation time when administering Bactrim to these patients.

Adverse Reactions: All major reactions to sulfonamides and trimethoprim are included, even if not reported with Bactrim. *Blood dyscrasias:* Agranulocytosis, aplastic anemia, megaloblastic anemia, thrombopenia, leukopenia, hemolytic anemia, purpura, hypoprothrombinemia and methemoglobinemia. *Allergic reactions:* Erythema multiforme, Stevens-Johnson syndrome, generalized skin eruptions, epidermal necrolysis, urticaria, serum sickness, pruritus, exfoliative dermatitis, anaphylactoid reactions, periorbital edema, conjunctival and scleral injection, photosensitization, arthralgia and allergic myocarditis. *Gastrointestinal reactions:* Glossitis, stomatitis, nausea, emesis, abdominal pains, hepatitis, diarrhea and pancreatitis. *CNS reactions:* Headache, peripheral neuritis, mental depression, convulsions, ataxia, hallucinations, tinnitus, vertigo, insomnia, apathy, fatigue, muscle weakness and nervousness. *Miscellaneous reactions:* Drug fever, chills, toxic nephrosis with oliguria and anuria, periarteritis nodosa and L.E. phenomenon. Due to certain chemical similarities to some goitrogens, diuretics (acetazolamide, thiazides) and oral hypoglycemic agents, sulfonamides have caused rare instances of goiter production, diuresis and hypoglycemia in patients; cross-sensitivity with these agents may exist. In rats, long-term therapy with sulfonamides has produced thyroid malignancies.

Dosage: Not recommended for infants less than two months of age.

URINARY TRACT INFECTIONS AND SHIGELLOSIS IN ADULTS AND CHILDREN, AND ACUTE OTITIS MEDIA IN CHILDREN

Adults: Usual adult dosage for urinary tract infections—1 DS tablet (double strength), 2 tablets (single strength) or 4 teasp. (20 ml) b.i.d. for 10-14 days. Use identical daily dosage for 5 days for shigellosis.

Children: Recommended dosage for children with urinary tract infections or acute otitis media—8 mg/kg trimethoprim and 40 mg/kg sulfamethoxazole per 24 hours, in two divided doses for 10 days. Use identical daily dosage for 5 days for shigellosis. A guide follows:

Children two months of age or older

Weight		Dose—every 12 hours	
lbs	kg	Teaspoonfuls	Tablets
22	10	1 teasp. (5 ml)	½ tablet
44	20	2 teasp. (10 ml)	1 tablet
66	30	3 teasp. (15 ml)	1½ tablets
88	40	4 teasp. (20 ml)	2 tablets or 1 DS tablet

For patients with renal impairment

Creatinine Clearance (ml/min)	Recommended Dosage Regimen
Above 30	Usual standard regimen
15-30	½ the usual regimen
Below 15	Use not recommended

PNEUMOCYSTIS CARINII PNEUMONITIS: Recommended dosage: 20 mg/kg trimethoprim and 100 mg/kg sulfamethoxazole per 24 hours in equal doses every 6 hours for 14 days. See complete product information for suggested children's dosage table.

Supplied: Double Strength (DS) tablets, each containing 160 mg trimethoprim and 800 mg sulfamethoxazole, bottles of 100, Tel-E-Dose® packages of 100, Prescription Paks of 20. Tablets, each containing 80 mg trimethoprim and 400 mg sulfamethoxazole—bottles of 100 and 500; Tel-E-Dose® packages of 100; Prescription Paks of 40, available singly and in trays of 10. Pediatric Suspension, containing in each teaspoonful (5 ml) the equivalent of 40 mg trimethoprim and 200 mg sulfamethoxazole, cherry flavored—bottles of 16 oz (1 pint). Suspension, containing in each teaspoonful (5 ml) the equivalent of 40 mg trimethoprim and 200 mg sulfamethoxazole, fruit-licorice flavored—bottles of 16 oz (1 pint).

Conduct with Pronestyl® Tablets

Procainamide Hydrochloride Tablets

The only procainamide in
sugar-coated, easy-to-swallow tablets

250 mg

375 mg

500 mg

available in 3 tablet strengths for easier dosage
adjustment—up or down—in all patients
produced under exacting quality control standards
by Squibb—numerous critical control tests from starting
material to finished product
offered only under the Squibb label—your assurance
of reliable, quality therapy for life-threatening arrhythmias.

See following page for brief summary

PRONESTYL® TABLETS

Procainamide Hydrochloride Tablets

The prolonged administration of procainamide often leads to the development of a positive anti-nuclear antibody (ANA) test with or without symptoms of lupus erythematosus-like syndrome. If a positive ANA titer develops, the benefit/risk ratio related to continued procainamide therapy should be assessed. This may necessitate considerations of alternative anti-arrhythmic therapy.

DESCRIPTION: Pronestyl (Procainamide Hydrochloride) is the amide analogue of procaine hydrochloride and is available for oral administration as veneer-coated tablets providing 250 mg, 375 mg, and 500 mg procainamide hydrochloride.

CONTRAINDICATIONS: In patients with myasthenia gravis and where a hypersensitivity to procainamide exists; bear in mind cross sensitivity to procaine and related drugs. Should not be given to patients with complete atrioventricular heart block. Contraindicated in cases of second degree and third degree A-V block unless an electrical pacemaker is operative.

PRECAUTIONS: Evidence of untoward myocardial responses should be carefully watched for in all patients. In the presence of myocardial damage with atrial fibrillation or flutter, the ventricular rate may increase suddenly as the atrial rate is slowed; adequate digitalization reduces but does not abolish this danger. Ventricular tachysystole is particularly hazardous if myocardial damage exists.

The dislodgment of mural thrombi producing an embolic episode may occur in correcting atrial fibrillation due to the forceful contractions of the atrium.

Extreme caution is required in attempting to adjust the heart rate when ventricular tachycardia has occurred during an occlusive coronary episode or where the use of procainamide may result in additional depression of conduction and ventricular asystole or fibrillation as in second degree and third degree A-V block, bundle branch block, or severe digitalis intoxication.

Bear in mind when treating ventricular arrhythmias in patients with severe organic heart disease and ventricular tachycardia that complete heart block, which may be difficult to diagnose, may be present. Since asystole may result if the ventricular rate is significantly slowed without attainment of regular atrioventricular conduction, procainamide should be stopped and the patient re-evaluated.

In the presence of both liver and kidney damage, normal dosage may produce symptoms of over-dosage—principally ventricular tachycardia and severe hypotension.

A syndrome resembling lupus erythematosus has been reported with oral maintenance procainamide therapy. Common symptoms are polyarthralgia, arthritis and pleuritic pain. Fever, myalgia, skin lesions, pleural effusion and pericarditis may also occur. Rare cases of thrombocytopenia or Coombs-positive hemolytic anemia, possibly related to this syndrome, have been

reported. Measure anti-nuclear antibody titers at regular intervals in patients on procainamide for extended periods of time or in whom symptoms suggestive of lupus-like reaction appear; in event of rising titer (anti-nuclear antibody) or clinical symptoms of LE, assess the benefit/risk ratio related to continued procainamide therapy (see boxed Warning). Steroid therapy may be effective if discontinuation of procainamide does not cause remission of symptoms. If the syndrome develops in a patient with recurrent life-threatening arrhythmias not otherwise controllable, steroid-suppressive therapy may be used concomitantly with procainamide.

ADVERSE REACTIONS: Hypotension is rare with oral administration. Serious disturbances of cardiac rhythm such as ventricular asystole or fibrillation are more common with I.V. administration.

Large oral doses may sometimes produce anorexia, nausea, urticaria, and/or pruritus.

A syndrome resembling lupus erythematosus has been reported in patients on oral maintenance therapy (see Precautions). Reactions consisting of fever and chills have been reported, including a case with nausea, vomiting, abdominal pain, acute hepatomegaly, and a rise in serum glutamic oxaloacetic transaminase following single doses of the drug. Agranulocytosis has been occasionally reported following repeated use of the drug, and deaths have occurred. Therefore, routine blood counts are advisable during maintenance procainamide therapy; and the patient should be instructed to report any soreness of the mouth, throat or gums, unexplained fever or any symptoms of upper respiratory tract infection. If any of these symptoms should occur and leukocyte counts indicate cellular depression, procainamide therapy should be discontinued and appropriate treatment should be instituted immediately. Bitter taste, diarrhea, weakness, mental depression, giddiness, psychosis with hallucinations, and hypersensitivity reactions such as angioneurotic edema and maculopapular rash have been reported.

For full prescribing information, consult package insert.

HOW SUPPLIED: Pronestyl Tablets (Procainamide Hydrochloride Tablets) providing 250 mg, 375 mg, and 500 mg procainamide hydrochloride are available in bottles of 100 and Unimatic® single-dose packaging in cartons of 100. The 250 mg and 500 mg tablets are also available in bottles of 1000.

'The Priceless Ingredient of every product is the honor and integrity of its maker.'™

Should Med-Chi Members Also Be AMA Members?

By BLAINE TAYLOR

Interviews with Drs. Russell Fisher, Charles O'Donnell and Stephen Padussis to help you decide . . .

Contact Mr. Taylor, *Journal* Managing Editor, for reprint information and further data c/o the *Journal*, 1211 Cathedral Ave., Balto., MD 21201.

Introduction

The two symbols shown below are those of (left) the American Medical Association (AMA), founded in 1847 and (right) the Medical and Chirurgical Faculty of the State of Maryland (common-

ly called Med-Chi, it is, in effect, the state medical society), begun even earlier, in 1799.

This year—as in every year past—the AMA is conducting a membership drive that it hopes will induce Med-Chi members not already belonging to the AMA to enlist.

Three prominent Maryland physicians (two of whom are past Faculty Presidents) who are members

of both organizations are Drs. Russell S. Fisher, 62; Charles F. O'Donnell, 61 and Stephen K. Padussis, 55. They are the Faculty's Delegates (Dr. Fisher is Senior Delegate) to the AMA's national House of Delegates, and they are all firmly behind the AMA's current "joint membership" campaign.

To further this effort, the three submitted to a lengthy collective

The seal of the American Medical Association shows the staff of Aesculapius enclosed in a circle. The staff of Aesculapius is a single serpent twining around a wooden staff. The serpent symbolism is of Greek origin. The serpent was an important part of the cult of Aesculapius' Greek temples. The serpent's relationship to healing has been attributed to its keen sight and long life, and to the fact that it annually renews its skin, suggesting rejuvenation and renewal of youth and health. Around the outside of the circle are the letters "AMA" and the words "American Medical Association." The seal of the Medical and Chirurgical Faculty of the State of Maryland, a fourth revision of the original Faculty seal, shows the Greek god of medicine, Aesculapius, seated, holding his staff, the traditional serpent, and surrounded by medical textbooks whose titles suggest the basic sciences which form the basis for medical knowledge. The myths regarding Aesculapius may have developed around a historical personage, perhaps an actual person. The term "Aesculapius" is sometimes used to mean any practitioner of medicine. Homer describes Aesculapius as "a mortal." In mythology, Aesculapius was the son of Apollo and Coronis. According to both Homer and mythology, Aesculapius learned medicine from Chiron, the Centaur. The Faculty seal shows a Greek temple of healing, realistically situated on a wooded slope. Such temples were centers of medical knowledge and a cult of healing. Individuals would spend the night sleeping in such a temple as part of their therapy. The Greek words at the bottom of the seal are taken from Homer's *Iliad*. A literal translation of the three words is, "Of more importance than other men." When put into the context of the surrounding lines in Homer's *Iliad*, a proper translation would be, "A physician is more important than other men, because he can attend wounds and still pain." Latin words surrounding the seal read, "Medical and Chirurgical Society of Maryland, Seal, Month of June, the 1799th year of the Lord and the 23rd year since the establishment of American liberty."—Joseph E. Jensen, Faculty Librarian.

Table 1: AMA Membership Benefits

AMA membership provides physicians with a broad range of tangible benefits both professional and personal. Among them are:

1. **PUBLICATIONS: Journal of the American Medical Association (JAMA)**—To help physicians keep on top of the latest scientific developments every week. **American Medical News**—Provides the latest information on events and personalities affecting the practice of medicine. **Specialty Journals**—For specific scientific information in a specialty, physicians have a choice of one of nine specialty journals.
2. **MEMBERS INSURANCE PROGRAMS:** AMA insurance programs provide substantial coverage at a cost considerably lower than what a physician would have to pay on an individual basis. The programs available are: Group Life Insurance, Excess Major Medical, Disability Income Insurance, Supplemental "In-Hospital" Insurance, Accidental Death and Dismemberment Plan and Office Overhead Expense Insurance.
3. **SEMINARS: Negotiations**—Designed to help physicians develop and improve their negotiating skills. **Practice Management**—Provides proven guidelines for effective and productive management of the physician's practice. Includes physical plant, personnel, procedures and patient relations. **Speakers' Training**—Instructs physicians in the methods and techniques of effective public speaking.
4. The nation's largest **Physician Placement Service**.
5. **CME programs**—expanded and regionalized to make Continuing Medical Education more convenient and less expensive.
6. The **research resources** of one of the nation's most up-to-date medical libraries.

An important benefit of membership are AMA's efforts to represent physicians and the medical profession in Washington:

7. **INTERESTS:** One of the AMA's major functions is to act as the advocate for physicians' rights and for the quality of patient care. Effective representation is critical because of the Federal government's mounting pressure for tighter regulation and control of medicine.
8. Every year, the AMA monitors, analyzes and reports on thousands of pieces of health-related legislation and regulations—at both the Federal and State levels. To meet specific legislative needs, the AMA has drafted its own bills.
9. AMA officers and trustees frequently testify before Congressional committees and Federal agencies. During the 95th Congress, the AMA has submitted formal, written testimony or furnished witnesses to testify more than 200 times on bills and regulations affecting health care delivery, and, on several occasions, it has been necessary for the AMA to take the government to court. In fact, the AMA spent over \$1,000,000 in 1978 on legal fees to defend the rights of physicians and patients.
10. **AMA Members' Retirement Fund.**
11. Young physician **"Starting Your Practice"** management workshops.
12. **Training programs for your medical office personnel, You, the Telephone Manager and Medical Collection Management.**

Here are examples of the AMA representing physicians' interests before Congress and governmental agencies:

13. The AMA is challenging an FTC administrative judge's initial decision that the AMA cannot establish ethical guidelines on physician advertising and solicitation.
14. The AMA is defending three antitrust suits filed by chiropractors to preserve medicine's First Amendment rights to speak out on public health issues concerning physicians.
15. The AMA worked with hospital groups to defeat the Carter Administration's proposal for rigid cost controls on hospitals which would have adversely affected the quality of hospital care.

The AMA is also involved in projects to improve rural, inner city, jail and emergency care; encourage family practice in medicine and curtail TV violence. There is also the Auxiliary's campaign to promote adequate immunization among the millions of our youngsters.

(All Tables courtesy of the AMA.)

interview held at the **Journal** office at the Faculty's headquarters building at 1211 Cathedral St. in downtown Baltimore late last year.

Dr. Fisher

The freewheeling, tripartite interview on Med-Chi and the AMA began, appropriately, with former Faculty President Dr. Fisher. The taped results follow.

Medical Education

Dr. Fisher, define, please, your role within the AMA.

I'm the Senior Delegate from Maryland, a post I've held for about the last five-six years; I've been a Delegate for 15 years within the structure of the AMA itself. I was elected six years ago by its House of Delegates to the Council on Medical Education, and re-elected in 1977; I'm now its Chairman, also. These activities concern education at the undergraduate level, the approval of accreditation of the medical schools, the accreditation of the postgraduate residency programs, which are now handled by a committee structure and, to a lesser extent, the burgeoning area of Continuing Medical Education (CME.)

The AMA started in medical education with a council as far back as 1904. Its primary role at this time is all three areas of medical education, as I've indicated. In undergraduate medical education, it is conjointly with the Association of American Medical Colleges—it being a 12-member committee, run half and half by the two parents—which are charged with the periodic reexamination of all medical school facilities, curricula and everything else having to do with the process.

It makes recommendations for improvement where indicated and for accreditation of the school if the program is satisfactory. This operation is very vital to the whole process of medical education in the United States. Without some sort of uniformity and quality control guaranteed by the Committee there's no telling what might have happened!

Until the famous Simon Flexner Report of 1910, there was all kind of incompetent and inadequate

curricula in medical schools, which were turning out people who were simply unsafe. Under the pressure brought about by the Flexner Report within the AMA, this situation was cleared up and, since the early 1920s there've been no more 'Class B' medical schools in this country, although there's still a lot of them around the world.

One can no longer be licensed in the US unless he has graduated from an accredited medical school, where he's following the regular American medical educational process.

As far as the graduate medical education process is concerned, the ultimate approval of the standardization of the residency review process has now been given over to a liaison committee, which in membership consists of the AMA, the American Association of Medical Colleges, the Council on Medical Specialty Societies, the American Board of Medical Specialties and the American Hospital Association. These groups are involved in a process that was strictly American medical until five years ago when the Liaison Committee on Graduate Medical Education was formed, but the process still is staffed by the AMA, and the AMA pays more than half the costs of its total financial operation, which, curiously enough, has a budget—just for

graduate medical education—of \$1,800,000 per year. All of this is spent on making the educational process available to residents and trainees as they advance their training from medical school to a sufficiently mature knowledge that enables them to be fairly-safe practitioners of medicine.

The AMA has an advisory committee in each of the three areas of medical education, which does a lot of the preliminary review of programs. We have an additional conjoint committee that's concerned with the accreditation of programs in medical technology, respiratory therapy, X-ray technology, etc: all together, some 15 of the allied medical health professions submit for accreditation their educational programs to what was formerly the AMA's committee on allied health and professional education, now called CAHEA—Committee on Allied Health Education Accreditation.

There was a void, a need for quality control, and the AMA was the only national body that could assume this responsibility. Early on, the profession responded to the obvious need and spent a large portion of its budget on the educational process. Anybody who goes to medical school or does a residency or gets continuing education depends upon the AMA for its

quality; therefore, local people—all doctors—who're concerned with this process ought to support the AMA's activities in these fields, if for no other reason than that it's a moral debt which we all owe because all of us enjoyed it.

We've all fed at the fountain for years and years, and continue to do so.

It's ludicrous for our colleagues who haven't chosen to enjoy the AMA to sit back and enjoy the fruits of their fellow men who pay the bills that operate the system.

Reasons for Non-Membership

It is possible that many younger physicians—say in the age bracket of 35-45—think the AMA is too conservative, and perhaps don't want to join for that reason or just aren't "joiners" or interested in organized medicine?

There're a number of reasons. One is that, as you say, a number of our colleagues aren't "joiners." They don't want to have anything to do with anything that smacks of politics. They prefer not to have any connection with what is, in many ways, a political organization.

The second important group is that which is just plain too stingy to put out the money that membership in the county and state societies and AMA means. It isn't an

DR. FISHER

DR. PADUSSIS

DR. O'DONNELL

insignificant amount! You have to belong to the local and state societies before you can be in the AMA. Each has an identifiable set of dues with an identifiable objective. (See Table 2—ed. note.)

Can someone be an AMA member and NOT a member of the local groups?

Only if they're in the Armed Forces or in Veterans Hospitals or some other governmental services. Another reason younger physicians

don't join is that they're starting out in practice, and that amount of money is really meaningful to them. Recently, the AMA has adopted a policy of permitting newly-established physicians to join at half the annual dues for their first year in practice. Unfortunately, there are also those content to ride on other people's coattails. That's true of any organization, though.

A certain number of people are inherently extremely liberal and

against the AMA's relative conservatism; they literally dislike what the AMA is doing, and therefore won't join. People who're completely convinced that nationalization of health under a socialistic scheme is the way to go obviously aren't going to spend their money in dues to the AMA, when the AMA is taking a more conservative course, which is that the majority of our members certainly believe in the free practice of medicine.

ARE there any doctors who're actually ADVOCATING nationalization?

Oh, yes.

Are these people those who might be hired later as NHI administrators?

No, I really think there're some beknighted people who're sufficiently socialistic in their views in that they regard the division of the wealth without relation to the division of the effort to be the millennium at which we should someday arrive. The majority of them, I think, are in the younger age group, though.

Academic Non-Members

Are the majority of doctors in Maryland who're NOT Med-Chi/AMA members centered in academic medicine, such as at the Hopkins and University of Maryland Schools of Medicine?

Among the areas that're conspicuous for low membership, the centers of academia are obvious.

Is that because these people are transient and feel that they're only here for a couple of years, only to move on later to some other teaching position, so why SHOULD they join?

I'm not concerned with Residents, or even those who complete Residencies here, but the academic people feel they're doing their own bit in the educational process and so say "Let somebody else do the rest of it." They're not interested in affiliating with an organization involved in politics, as the AMA is, but political involvement is dealing with the malpractice issue, getting legislation that protects the patient, helping control infectious, contagious disease, etc. I feel they, too, have a stake in joining.

Table 2: Dues

1. **Local, component society dues vary;** check your individual society
2. **State (Med-Chi) dues are:** \$160 a year (figure includes \$5 for the Society's Educational Fund) for members in their third and subsequent years of practice, members in their second year of practice pay \$90, while those in their initial year pay \$80
3. **AMA dues (in addition to those figures cited above) are:** \$125 annually for those in their first year of practice, and \$250 a year thereafter

Table 3: What Did Not Happen Because of the AMA

1. **National Relicensure.**
2. **Regulation** of residency assignments and rationing by specialty.
3. **Cradle-to-grave, Federally-run National Health Insurance**
4. **Capricious** utilization review regulations
5. **Precertification** of Hospital Admissions
6. **Full "public utility" control** of medicine
7. **Phase V controls on MD fees**
8. **Federal (or state) licensure** of physicians' office laboratory
9. **Legislation imposing** additional restrictive medicare reimbursement levels on physicians

Table 4: What Did Happen Because of the AMA

1. **Improvement of the Keogh Law** to permit increased annual contributions for retirement to 15% of earned income or \$7,500, whichever is less—A savings worth many times the annual dues
2. More than 4,000 Continuing Medical Education programs accredited for benefit of the profession
3. AMA developed guidelines for **improving medical and health care in jails** now being tested in 30 communities
4. **Financially hard-pressed medical and dental schools** in District of Columbia receiving Federal support
5. Universal health insurance claim form—more than nine million already in use
6. **Enactment of the Military Medical Practice Act** that makes the Federal government exclusively liable for malpractice damages in the military and uniformed services
7. Detailed AMA policy on **Hospital-Physician** relations designed to protect the rights of medical staffs and individual physicians
8. **AHA acceptance of concept** that medical staffs should be represented on hospital boards
9. **Rapid expansion of medical schools** in past decade
10. **Extensive Health Manpower Training** support.
11. **Development of legislation** for emergency medical services systems
12. **Significantly increased pay** for military, VA and other Federal physicians

Other Groups

All right. Is the AMA the only nationally-recognized group of and for physicians?

No. It has no serious rivals, but there is also the black National Medical Association (NMA). We have a generally cooperative operation with them, as we invite their officers to participate in our deliberations at the Annual Meetings, and vice versa. There is no open rivalry. They're organized to do something about what they consider to be the poor participation of blacks in American medicine.

Delegate-Society Ratio

Earlier, in private, you mentioned to me that, if more Med-Chi members joined the AMA, Med-Chi would be entitled to a FOURTH Delegate. Is the ratio based on one member per every so many physicians? How does the formula work?

One Delegate is the base for any state, and then you get an additional Delegate for every 1,000 members or any portion. The term of office for each Delegate is three years.

US and Foreign MDs

Do you think it's fair to say that US doctors are the best-trained in the world?

No question about it! There're other systems that're probably comparable, such as the West German educational process.

What about Soviet doctors, and those in Iron Curtain countries in Eastern Europe?

From people I know who've gotten sick there, their facilities are incredibly inadequate.

FMGs in the US

Who deals with the issue of the Foreign Medical Graduates? From what many people tell me, there're a lot of them practicing medicine here who cannot speak the English language. One suspects that the nurses are really practicing medicine and teaching the doctors as they come in.

The AMA is one of the many agencies concerned with this problem. They helped establish the Educational Council for Foreign Medical Graduates to participate in

writing a series of regulations requiring minimal English and educational proficiency in ethics, as well as technical areas.

There's a point of view that Americans share—which I consider a general understanding—which isn't characteristic of medicine all over the world in the less fortunate countries, where some patients are treated more like animals than people. Early on, the AMA stated in all the FMG residency requirements that special training in the understanding of the humanistic aspects of medicine was necessary.

More recently, the State Department, in response to pressures from the AMA and the American Hospital Association, has changed the

rules through which FMGs get into the US. Now, instead of coming in with a special visa that declared doctors were in short supply and therefore didn't have to be limited by quotas, all FMGs who intend to come in are limited by Immigration quota.

What about in terms of time spent residing here?

The Immigration group constitutes the bulk of the better than 6,000 doctors entering this country every year. In addition, the State Department had a great plan 20 years ago under which we'd have exchange visitors—citizens of other lands who would come here, learn how to practice medicine, do a residency and then go home. Unfortun-

Table 5: AMA National Health Insurance Bill

1. **Builds on the present system**
2. **Provides Federal assistance on basis of need**; the most help goes to those who need it most
3. **Allows everyone to choose his own physician, dentist, health insurance plan and type of practice arrangement**
4. **Provides more comprehensive benefits** than any other bill and includes coverage against costs of mental illness
5. **Protects against costs of catastrophic illness** without any ceiling on benefits
6. **Provides realistic preventive care benefits** including well-baby care, physical exams, immunization, out-patient psychiatric care and X-ray and lab work
7. **Provides continuation of coverage for the unemployed**
8. **Provides supplemental coverage for non-employed medicare enrollees**, bringing their benefits up to NHI level
9. **Cost Control by limiting Federal help** to those in need, co-insurance (except for the poor), competition among carriers and providers, many services on ambulatory basis to avoid hospitalization
10. **Least Expensive of all NHI bills** in new Federal spending.

Table 6: AMA Statement on National Health Insurance

The AMA believes that everyone should have health insurance, at adequate benefit levels, and that the gaps in the present system that affect some segments of the population need to be filled. Nearly 190 million individuals have private or "public" insurance coverage, and the benefits provided under much of the coverage are broad and comprehensive. Approximately 20 million people do not have access to coverage for varying reasons, and the Association supports the extension of appropriate insurance coverage to these segments of the population.

The Association is cognizant of the growing problems facing other nations with government-controlled health programs; the rising costs of health care and the effect that a massive Federal program would have on an already-overheated segment of the economy and the priority that the nation needs to give to controlling inflation and eliminating waste and inefficiency.

The Board of Trustees, the Council on Legislation and the Council on Medical Service will be conducting a comprehensive review of National Health Insurance policy over the next several months. A complete summary report on this issue and any recommendations that might be appropriate will be submitted to the House of Delegates in ample time for consideration by the Delegates prior to the 1979 Annual Meeting in July or a special meeting of the House if it becomes necessary for one to be held.

nately, this bombed, because they got here, saw how good it was—not just financially, but also in terms of facilities and capabilities to practice medicine as opposed to the poor conditions at home—and they stayed. They married an American or had a child here or petitioned the State Department to void the original contract, which said they would return home after two years, but that was extended eventually to five years to complete a residency. Then they said, “You may come back after you’ve been home for two years,” but anybody could come back as an immigrant. They got special priority because they were doctors, but the State and Labor Departments abolished that. Also, the rules under which you could come as an exchange visitor were tightened up.

Now, if you come as an exchange visitor, you need a letter from your government stating it’s sponsoring you, and that your country needs the kind of education we’re going to supply. Furthermore, you’re committed to go back in two years. You must have a letter from the organization that is going to train you stating it has the facilities and

is willing to train you. You must pass a special examination which is equivalent of parts one and two of the National Board of Medical Examiners, too.

I’d like you to respond to this fictional scenario: first, doctors in the US are under the gun from the Federal government to fill medical slots in hospitals, and there aren’t enough doctors to go around; second, there’s a nefarious plot to keep Americans OUT of medical schools because eventually they would earn more money than FMGs and thus cut into the profits US doctors get; third, the method by which the Federal government is gotten off the backs of the profession, fills the slots and keeps Americans out of medical schools is to staff the hospitals with FMGs. Is there any truth in that at all?

There was never any plot to limit medical graduates in the US. On the other hand, over the last 20 years, to my knowledge, there’s been a strong and continuing effort to increase the numbers of American graduates.

In the middle 1960s, we graduated 7,000 students a year na-

tionally from 70 schools. With the strong support of the AMA Council on Undergraduate Medical Education, we now have 116 medical schools—with 125 to exist within the next three years—graduating 15,750 people, annually. The output has more than doubled.

How come we have Americans going abroad to study medicine?

Medicine has been such a revered and lucrative profession that it’s very attractive. For many years, when engineers were in surplus supply, bright students turned to medicine so that there were three or four candidates for every vacancy in a medical school’s freshman year. Now, in relationship to the number of slots available, that number has decreased, within the last five years.

Postgraduate Education

A recent article in the Baltimore SUN about medical students stated what THEY felt about being in medical school. The overwhelming feeling they had was that there just wasn’t enough time to absorb all the material. One person talked about opening a book, merely looking at the subject and then going on. Another said that in every class he went to, he was assigned a hundred pages daily to read. Part of the reason for that regimen, of course, is to discipline the person to cram a great amount of activity into a small amount of time, but is that really very wise—especially in an area like surgery?

Well, this is the reason that specialization developed in the first place. There was an ever-increasing, detailed body of knowledge. Take a hand surgeon, for example. Even though I’m something of an anatomist and oncologist, I would be totally lost if I had to reset in detail a hand injury to take care of the necessary safeguarding of nerves and blood vessels, etc. It takes a person literally years to learn to deal with the intricacies of the anatomy that God gave us in the most productive, protective way. All you can do in medical school is to give them a smattering of information about the certain state of the art and science, and

Table 7: AMA Efforts for the Public

AMA has sponsored bills to:

1. **Develop** model rural health delivery systems
2. **Improve** Indian health
3. **Create** more equitable way for blood banks to acquire blood
4. **Require** adequate prescription drug labeling; legislation based on AMA bill to develop community emergency medical programs passed 93rd Congress. (Public Law 93-154)

AMA has also supported:

1. **Drug Abuse Education Act**
2. **Efforts to ensure safe, quality medical devices**
3. **Maximum funding** for maternal and child health
4. **Federal assistance** for schools and students of medicine, nursing, public health
5. **Adequate appropriations** for NIH research and for FDA
6. **Strong clean-air standards**
7. **Noise-abatement** legislation
8. **Migrant health care program**
9. **National Health Service corps program to supply physicians for shortage areas**
10. **Research and control of communicable disease and VD**
11. **Federal support** for community mental health centers
12. **Radiation safety laws**
13. **Research** on kidney disease, cancer
14. **Control** of lead-based paint

hope that they can see in their post-graduate years areas that interest them in which they will keep up. That's a continuing struggle. I don't envy the family practitioner who has to cover the waterfront, because the task is incredibly great, and he's under all the other pressures of a busy practice, too!

Thank you, Dr. Fisher. Now, we'll turn to Dr. O'Donnell.

Dr. O'Donnell

Charles F. O'Donnell, MD, lives and practices at the same address on York Rd. in Towson, MD. Both his practice and his involvement in organized medicine began in 1945, when he joined the Baltimore County Medical Association (becoming its President in 1952), the AMA and Med-Chi (he was Faculty President-Elect in 1961-62 and President the following year.)

Born March 26, 1917 in Brooklyn, NY, his elementary education took place at a public school in Malverne, Long Island, but he did not attend high school; instead, he took the New York State Board of Regents Examination "In enough subjects," he says "to piece together a college entrance diploma."

In 1941, upon entering the University of Maryland School of Medicine after having completed the necessary educational requirements in Chemical Engineering at the Johns Hopkins University, O'Donnell went to work at the Bethlehem Steel-Fairfield Shipyard Hospital. He received his MD degree in 1944, the same year he was honorably discharged from a Reserve Commission of three years in the US Navy Medical Corps.

Following an Internship at Baltimore's Mercy Hospital, he was appointed an Assistant Surgical Resident in January, 1945; and began practice of Family Medicine in Towson.

Dr. O'Donnell has been a member of the Maryland Academy of Family Practice since 1948 (and was its President during 1948-50), was a Founding Member of the American Academy of Family Practice (in 1947), and was a Delegate from the state to the National Academy during 1949-55.

AMA Activities

Since Dr. O'Donnell has been heavily-involved with the inner workings of the AMA for the last 15 years as both a Delegate and Alternate, he naturally feels that seniority and experience in the two jobs are important, and the Journal interview with him began on this note.

•

I agree with Dr. Fisher that the AMA system is so complicated that you have to spend years and years learning it in order to contribute maximally. That's why I think that the experienced representation Med-Chi enjoys with the AMA should be retained.

It's difficult for younger physicians who're just starting out in their practices to be heavily-involved in this manner with the AMA, because they just don't have the time for it. Make no mistake about it—being a Delegate to the AMA is very financially costly, too. While the expenses of the Delegates and Alternate Delegates are almost covered for our trips on

AMA business, we all lose income when we're away from our practices.

I'd be willing to bet that any physician who serves as a county medical society President has his income decreased by 10% the year that he serves as President, and a Faculty President loses 20%.

Why do you do it?

Because it's what I believe in, and I can afford the income-loss now that my family is raised. I feel that, if you're part of an organization, you should participate fully. Getting back to the youth question, you have to start a prospective Delegate out rather young because it takes about 15 years of experience to build up the knowledge you need to get the job done when you reach Delegate. My route over the years was a little different from Dr. Fisher's. I went from almost every committee that the county medical society had to the state society and worked on almost every committee it had, then was an Alternate Delegate for nine years, attending meetings to famil-

iarize myself with the operation and, finally, have been a full Delegate for the last seven.

I'm on the AMA Council on Long-Range Planning, and was recently elected to the President's Forum, which is the Committee selected to get together the program for the state Presidents yearly at the AMA meeting.

Concerning the Council on Long-Range Planning, would it be fair to say that the decisions you're making now will affect American medicine—and, ultimately, everyone—well into the decades of the Eighties and Nineties and possibly into the next century?

I think so. First, let me say it's an appointment I'm proud of, since it's one of only two made by the Speaker of the AMA House of Delegates to represent the House, which is the AMA ruling body. The membership of the Council is unique among AMA councils in that it's fully appointive. Aside from the two Delegates appointed by the Speaker, two people from the membership-at-large are also appointed and one member from the AMA resident membership, too. The Chairman of the Board of Trustees of the AMA appoints two members from the Board, two from the AMA membership-at-large and one from the medical student membership.

By being appointed, we don't have to be afraid of saying things that are unpalatable.

How long is your term of office?

Three years, and we can be reappointed for three consecutive terms for a total of nine years.

While we answer to the Speaker alone, he answers to the whole House, and must stand for reelection, so he'd better not appoint somebody opposed by the House; he'll be in hot water if he does!

Thus, I feel that my appointment has House approval tantamount to election.

The Council's Work

Describe for our readers, please, the Council's work.

Basically, the Council's function is to study and make recommendations on the long-range objectives of the Association in terms of research, organization and programs. It also serves as a focal point for the planning activity of the Association to stimulate and evaluate planning throughout the organization. We study the future environment in which medicine and the Association will function, plus collect relevant data to be interpreted, transmitted and studied for the Board of Trustees for distribution to the decision-makers throughout the Association.

From time to time, on an annual basis, the Council issues reports to the House of Delegates.

Group vs. Solo Practitioners

One of the things we're working on is group practice and, strangely enough, there are more AMA members in groups than there are in solo practices, which makes me feel that one of the reasons we lack membership in the AMA is that no one is selling the AMA to the individual solo practitioner, whereas, in group practice, 90% of the men

in the groups belong. Many specialty societies encourage their members to belong to the AMA, while no one encourages the solo person.

There are some 880 different methods by which the AMA gets dues from its members. Due to the fact that we're a federation, we can't bill everyone. If we, in some way, could bill directly every physician in America, instead of through the county and state medical associations, we'd have a much better membership.

Why can't you?

Because the states have that right as a federation; you have to belong to the state society first.

Female Representation

The Council also works on the role of female physicians in organized medicine. Today, women feel that they should have a greater role than in the past. It's very hard to "slot" positions on the AMA Council for women. We do slot them for medical students and interns and residents, but they're only there for a period of a few years. We're encouraging the AMA Trustees to appoint women to committees where possible. We do have a woman on the Council and, this past year, 25% of all medical school graduates were women, and it's going up every year. Eventually, the mere fact of these increasing numbers will take care of their having a fair say in everything if they actively participate. Twenty years from now, one-third of all practicing physicians will be women.

Another item that the Council is

*Based on contributions of \$1500 the first of each year earning 8% interest annually and assuming the rate remains constant.

examining is the role of the AMA itself—what **should** it be doing? At times, the Council acts as a sort of “think tank” to consider all kinds of problems, and we see this happening all the time in the House, too.

Financial Work

Beginning in December, 1974, I began serving on a Special Ad Hoc Committee when the AMA was just about bankrupt. We met on the average of one week a month over the next six months, sometimes five days at a stretch. By June, 1975, the Committee came up with a Special Committee Report which helped turn around the finances of the AMA. That was when we more than doubled the dues, made plans to get rid of all unprofitable journals and suggested selling certain pieces of land. Over the last three years, we've gone from practically no cash reserve—plus a million dollars' worth of property and a debt note of \$3 million—to about \$38 million in cash reserve to offset an IRS bill of \$15-30 million on back taxes we must pay if we lose our court fight. I think that Special Committee did a pretty good job!

Other AMA Activities

If there had never developed the threat of socialized medicine, would there be a **NEED** for the AMA?

Yes. The AMA spends less than three percent of its annual budget on so-called “political” activity. The AMA produces **JAMA** and other journals, all sorts of pamphlets for the public, spends money for medical education, provides its share of the costs of the Joint Commission for the Accreditation of Hospitals (JCAH), does govern-

ment work under contract on health and maintains the largest, single, factual health library in the world in Washington.

As far as socialized medicine is concerned, I think we're farther from it today than we've **ever** been, because the public doesn't want it. We may eventually have a **form** of National Health Insurance (NHI), but it will be modified so that we, as physicians, will have input into it. It won't be something that terrifies us all: “You live in Zone 10; you see Dr. Number 275.” I recently took a trip to visit the Canadian health system to study it. This is another reason for physicians to join the AMA! Canada wouldn't be where it is if the profession there hadn't been fragmented.

Is there anything you'd like to add?

Since I keep pretty close to the pulse of things in my community at home, I think I have a broad knowledge to give to my AMA work. From my position within the home county and state medical societies, I hear how various groups react to different things.

I cannot stress too strongly that we should find some method whereby every physician in America should be invited to join the AMA.

Thank you, Dr. O'Donnell.

Dr. Padussis

The third member of the Faculty/AMA troika, Stephen K. Padussis, MD, of Lutherville, MD was born May 5, 1923 at McKeesport, PA, son of Constantine Gus Padussis and Anna L. Padussis, the youngest of four children.

The family moved to Baltimore

when Stephen was three years of age. He was educated in the Baltimore City Elementary Schools and attended Baltimore City College from 1939-42. He did his undergraduate college work at the University of Maryland from 1942-44 and matriculated at the University of Maryland Medical School in July, 1944, graduating in May, 1948 with an MD degree. (He was also certified in postgraduate surgical anatomy work there.)

His internship was in St. Agnes Hospital from 1948-49, where his Surgical Residency was served from July 19, 1949-June 30, 1953. Dr. Padussis then entered the practice of General Surgery at 3301 N. Charles St. in Baltimore in association with Dr. George Stewart from 1953-54. In 1954, he was called into active service with the US Army 43rd Mobile Army Surgical Hospital (MASH) in Korea through 1956. He returned to the private practice of General Surgery that year and had his office at 401-402 Medical Arts Building until 1969, when Dr. Padussis transferred his surgical practice to the St. Agnes Medical Center at Pine Height and Wilkens Avenues, where he is currently practicing.

His professional memberships include the Baltimore City Medical Society (1953-present); the Baltimore County Medical Association (1978), Med-Chi (1953-present), the AMA (1953-present), AMA Delegate (1977-present), the American College of Abdominal Surgeons (1962-present), the Southern Medical Association (1956-present) and the American Geriatrics Society (1958-present).

ments include Church, Bon Secours and South Baltimore General Hospitals, as well as being on the Senior Attending Staff at St. Agnes (all in Baltimore.)

His civic activities have been the following: appointment in 1962 by then-Gov. J. Millard Tawes to the Chesapeake Affairs Commission, the Maryland State Physical Fitness Commission (1962-71), the Baltimore County Board of Health (1969-74), being a Board Member of the National Conference of Christians and Jews, the Malpractice Task Force, Chairman of the Professional Component of the United Fund of Central Maryland (1978), appointment by then-Gov. Marvin Mandel to the Planning Advisory Council of the Comprehensive Health Planning Agency, appointment to the Governor's Commission to study Nursing Homes and the State's Health Coordinating Council (1974-present.)

A member of the Baltimore PSRO Committee on Institutional Care since 1977, Dr. Padussis' Med-Chi involvement has included Chairmanship of its Legislative Committee (1972-74 and 1978-79) and being on its Liaison Committee on Nursing Homes (1973-75.)

Dr. Padussis received the Governor's Citation Award in 1965 from Gov. Tawes and again a decade later from Gov. Mandel. In October, 1976, he also received the Baltimore Greek Community's First Annual Ad Hoc Award.

Married to Helen Klosteridis Padussis, Dr. Padussis' two children are Regina Padussis Panos (married to the son of Evening Sun Political columnist Lou Panos) and Stephanie Helen Padussis.

The Junior Delegate

Dr. Padussis, what is YOUR role within the AMA?

I'm proud to be the junior Delegate to the AMA and to be associated with such fine colleagues as Dr. O'Donnell and Dr. Fisher. I've been an Alternate Delegate for two and a half years, and a Delegate for one year. I'll be up for reelection in two years.

I've been appointed by the Speaker of the House to Reference Committee F, which is the Board of Trustees Advisory Committee. It meets formally twice a year and picks up any resolutions which are submitted for hearing and final approval or disapproval of the proposal to be submitted to the entire House on recommendation of the Committee for a vote. The term is three years.

There are eight Committees, labelled A through H, and this is the 6th—hence, the name. As examples of such matters considered, there's budget, membership, administration, organization and so forth. My Committee is equivalent to the US House of Representatives' Ways and Means Committee.

AMA Funds

Let's talk a bit about AMA finances.

I'd be happy to! The AMA presently is in a very stable and enviable position financially; however, there are some problems with inflation increasing AMA costs, and that position may change within the next few years.

Answering the Critics

As the youngest and junior of the

three Med-Chi Delegates, what is your response to people who say that "The AMA is a closed shop of guys who've been in there for years dictating policy, and we won't have a chance for input if we join?"

Conversely, I believe the opposite! I'm imbued with the spirit of the AMA and of Med-Chi, which is one of progressing with medicine in all its aspects in the health care fields. The AMA today has a greater influx of medical students and young residency graduates joining than ever before. On the other hand, some of the older citizens who're practicing medicine are tending to drop off, apparently preferring not to pay their dues as they get older and closer to retirement. The spirit and unity of the new members are also greater than ever before. These young leaders are polished and highly-inspired. They feel as I do that what the AMA is doing today is progressive and not necessarily conservative.

I feel everyone should join the AMA, as there's only one national voice that speaks for all medicine—and for me—and that's the AMA.

I've been broadened by my experience with both the AMA and Med-Chi.

Thank you, Dr. Padussis. ☐

Cancer Cells

By RAYMOND J. DONOVAN, JR., MD, FACS

For reprint and other data, write Dr. Donovan at 3350 Wilken Ave., Balto., MD 21229.

Cancer cells have invaded the bone
Where they got started is not known
But spread they did to a distant part
And the doctors don't know how they got their start
I lie here thinking and moan in pain
All efforts to cure me must be in vain.
The doctors are kind and the nurses, too,
But it's clear to me there is nothing to do.
But lie here and wait for another shot
And try to figure the time I've got.
There is much to do in the time that remains
But where do I start when crippled with pains?
I never knew there were so many tests
That hospitals proudly provide for their guests.
Blood tests and scanners and awesome machines
Even technicians who catalogue genes.
Beeping and clicking the machines take my measure
While the cancer cells growing destroy what
treasure.
Floating from some place as yet unknown,
They forage for food and stick in the bone.
They said it may have begun in the breast
And tomorrow they scheduled the final test
It is "just a biopsy," he said with a smile
"It will all be done in a little while."
"We must have tissue so we know how to treat,"
The Resident reasoned and shuffled his feet.
"The biopsy will give us a definite answer,"
But what does it matter when the report says Can-
cer?
They tell me they have some marvelous drugs,
That search and destroy the cancer bugs.
But I know the drugs can't do it all,
And I lie here in pain and want to bawl.
My hair will fall out and my gums will bleed,
If I can believe the things I read.
But is that better than the stage I'm in,
I know the answer "I just can't win."
I hope they give me enough for pain,
And don't bring up addiction again.
If they can make the pain relent,
Perhaps I'll have time to truly repent.
So go ahead and make your cut
Unaware of my knotted gut.
Then tell me the verdict I knew already,
And try to make your voice be steady.
As you explain the treatment plan
Don't be afraid to hold my hand,
Because I'm the one who wants to groan
"The Cancer Cells are in my bone!"

Consider the advantages of **COMPLETE MEDICAL EQUIPMENT LEASING**

More and more professional men and women are discovering that leasing equipment from Savers Leasing Corp. can be a lot more practical than buying. Here's why:

- A plan tailored to your professional needs
- No initial capital outlay
- Extended terms available
- Complete turnkey leasing
- The ability to acquire the latest in medical equipment

Call 539-0108 for all the details. It might be the most important move you make all day.

Generics save money. Big money!

The FTC estimates that \$400 million could be saved annually on the nation's Rx bill if physicians prescribed generics. Are you saving *your* patients extra dollars?

Purepac, America's leading manufacturer of a national brand of generics, would like to show you the tremendous savings possible with just three of our 700 generic products:

DRUG		AVERAGE RX PRICE (100's)	\$ SAVINGS WITH PUREPAC	% SAVINGS WITH PUREPAC
Pavabid Capsules*	150 mg.	\$10.32		
Purepac Papaverine	150 mg.	3.95	\$6.37	61.7%
Equanil Tablets*	400 mg.	8.15		
Purepac Meprobamate	400 mg.	1.85	6.30	77.3%
Librium Capsules*	10 mg.	8.76		
Purepac Chlordiazepoxide HCl.	10 mg.	3.90	4.86	55.4%

*Registered trademarks of Marion Labs., Wyeth Labs., Roche Labs., respectively.

Purepac generics save money. Big money. Purepac is dedicated to providing your patients with quality products that are equivalent to their brand name counterparts at significant savings.

But we can't do it alone. We need your cooperation.

Send for Purepac's *free* Brand Name/Generic Name Reference Chart today. You'll receive an alphabetical listing of brand name drugs with their generic counterparts.

And next time you write a prescription, write for Purepac brand generics. Your patients will know you care.

PUREPAC. Competitive prices and peace of mind.

Intraligamentous Extrauterine Pregnancy

By H. MELVIN RADMAN, MD

For reprint and other data, write Dr. Radman at 3601 Clarks Lane, Balto., MD 21215.

Extrauterine gestation, or ectycesis, is a common disease that has been estimated to occur as often as one in every 200 to 300 cases of pregnancy;¹ however, in recent years, there seems to be an increase in its appearance and in an earlier age group. Present calculations have found ectopic pregnancy in the ratio of one to 133 live births.² The causative factors in the increase may be considered as sexual promiscuity with resultant pelvic inflammatory disease, an increase in induced abortions and the use of intrauterine devices.³ The various manifestations, diagnosis, complications and the treatment have been explored extensively and further discussion from those views could only be academic. Schumann's⁴ legendary scholarly treatise on the subject states that the intraligamentous variety of the disease is comparatively rare. Kobak, Fields and Pollack⁵ define intraligamentous pregnancy as a gestation which grows within the space made by the folds of the broad ligament. Since that type of ectopic gestation is the rarest of extrauterine pregnancies, an additional case report added to current medical publications could be of interest.

Case Report

Mrs. L.B., aged 35, a para 22002, was seen on Sept. 20, 1976 with a history of delayed menses. Her periods had always been regular. She had discontinued oral contraceptives for several months and now was using a diaphragm; however, in mid-August, she had sexual intercourse without benefit of contraceptive precautions. Her last regular period was on July 29, 1976. At the initial examination, the uterus was found to be slightly enlarged. A pregnancy test was positive. The estimated date of confinement was May 6, 1977. Because of the stress of socioeconomic conditions, interruption of pregnancy was requested. On Sept. 28, 1976, the uterus was presumably emptied by suction; a small amount of tissue was obtained. The surgical pathologic report

revealed endometrium in the secretory phase with no evidence of fetal parts, placenta or chorionic villi. The Arias-Stella reaction was present. Because of those findings, an extrauterine pregnancy was suspected and the patient was alerted for signs and symptoms of rupture.

Approximately three weeks later, another pelvic examination was done and the uterus or pelvic mass had increased in size. She continued to have breast fullness, nausea and vomiting and practically no vaginal bleeding. Another pregnancy test on Nov. 4, 1976 was found to be positive. Because of continued enlargement of the pelvic mass, the positive pregnancy test and the symptoms of pregnancy further exploration of the uterine cavity was done. No tissue was obtained. On Nov. 8, 1976, the pregnancy test was again positive and on Nov. 11th, an exploratory laparotomy was done. By this time, the pelvic mass could be felt abdominally and reached two-three finger-breadths above the symphysis. At operation, an intact intraligamentous pregnancy was discovered involving the left adnexal region. The entire mass, however, was found adherent superiorly to the fundus of the uterus, and thus was explained the physical findings. A left salpingo-oophorectomy was done. Upon opening the sac, the fetus was found to measure 7 cm. (crown-rump). The post-operative course was uneventful and she was discharged from the hospital in one week.

Discussion

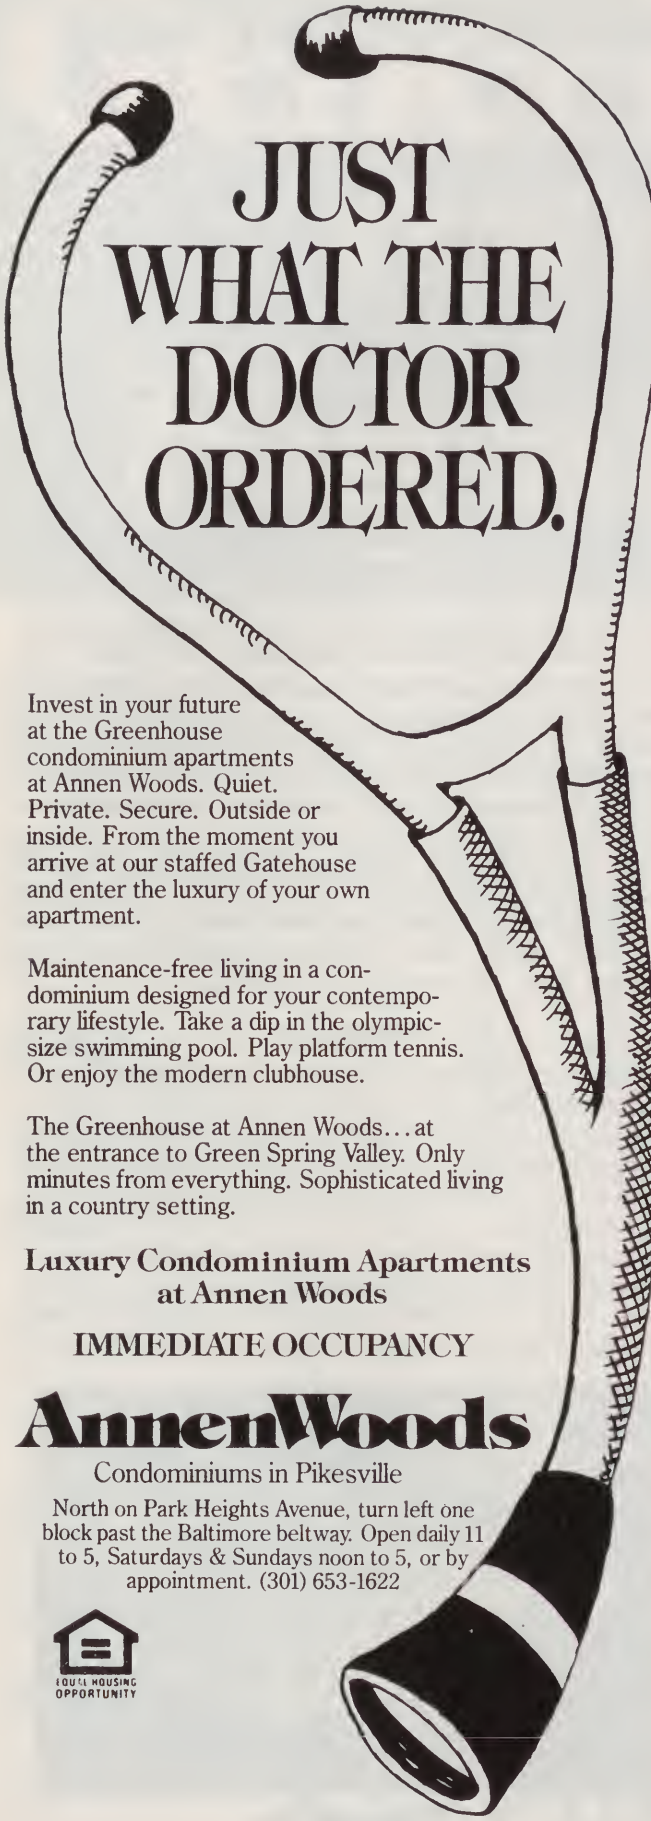

Standard textbooks and medical publications in regard to intraligamentous pregnancy give little information on the subject. When tubal rupture is somewhere along the line of attachment of the mesosalpinx the embryo is expelled and lies between the folds of the broad ligament. As stated by Novak and Woodruff, and in detail by Kobak et al, the gestational growth proceeds into the intraligamentous space. Rupture could occur with serious sequelae to the mother, or the pregnancy could continue and become abdominal. The

necessity for postoperative evaluation as well as preoperative study of any given patient is accentuated by the train of events in this patient.

Under those circumstances, a logical approach can be made to the diagnosis and treatment of patients with similar disease entities. Of great importance and emphasis was the fact that no placental tissue or chorionic villi were found in the tissue removed at the first curettage. In addition, the Arias-Stella reaction was confirmatory, despite the appearance of the phenomenon in other than patients with extrauterine pregnancy. Continued uterine growth was noted, and thus the symmetrical enlargement of that organ made the findings misleading. When the uterus was found to be empty and the pregnancy test again positive, there could be no doubt that a pregnancy existed outside of the uterine cavity. Early laparoscopy examination might have been of help; however, laparotomy was chosen because of the certainty that the extrauterine pregnancy existed. Although the pelvic findings in this patient appeared to be misleading, in reality they were characteristic of the Ruge-Simon syndrome,⁶ consisting mainly of elevation of the affected cornu, displacement of the fundus toward the opposite side and insertion of the tube into the inferior surface of the enlargement. While the diagnosis of ectopic pregnancy at times is not difficult, it is not always easy. On occasion, the entire picture is obscure.

Because of the serious complications which may follow, it is important to treat this condition without delay. Whenever aberrant bleeding, unusual findings and adequate surgical pathologic reports are obtained, the index of suspicion should remain high.

he's effectively
maintained on

QUIBRON[®]

Each capsule or tablespoonful (15 ml) liquid contains theophylline (anhydrous) 150 mg and glyceryl guaiacolate (guoifenesin) 90 mg

- theophylline for effective around-the-clock bronchodilator therapy
- 100% free theophylline

Indications: For the symptomatic relief of bronchospastic conditions such as bronchial asthma, chronic bronchitis, and pulmonary emphysema.

Warnings: Do not administer more frequently than every 6 hours, or within 12 hours after rectal dose of any preparation containing theophylline or aminophylline. Do not give other compounds containing xanthine derivatives concurrently.

Precautions: Use with caution in patients with cardiac disease, hepatic or renal impairment. Concurrent administration with certain antibiotics, i.e., clindamycin, erythromycin, troleandomycin, may result in higher serum levels of theophylline. Plasma prothrombin and factor V may increase, but any clinical effect is likely to be small. Metabolites of guoifenesin may contribute to increased urinary 5-hydroxyindoleacetic acid readings, when determined with nitroazanaphthal reagent. Safe use in pregnancy has not been established. Use in case of pregnancy only when clearly needed.

Adverse Reactions: Theophylline may exert some stimulating effect on the central nervous system. Its administration may cause local irritation of the gastric mucosa, with possible gastric discomfort, nausea, and vomiting. The frequency of adverse reactions is related to the serum theophylline level and is not usually a problem at serum theophylline levels below 20 mcg/ml.

How Supplied: Capsules in bottles of 100 and 1000 and unit-dose packs of 100; Liquid in bottles of 1 pint and 1 gallon.

See package insert for complete prescribing information.

Installation Address, AAMSE Meeting, St. Louis, MO

By MICHAEL W. McMANUS

Mr. McManus is Executive Vice President of the Medical Society of Milwaukee County, where he can be contacted for reprint and other data at 411 E. Mason St., Milwaukee, WI 53202.

In case you haven't noticed lately, we're at war.

At the AAMSE National Education Seminar there was a very timely topic entitled *The Attack on Professionalism*. And you know what? I couldn't attend. I had to stay in Milwaukee with our officers and legal counsel doing corporate battle with the Federal Trade Commission, the State Attorney General's Office and the IRS—all at the same time!

I've spoken with many of you and learned that medical associations at all levels—including specialty societies—are being snowed under with subpoenas for Board minutes, records dealing with mediation and ethical matters, the activities of insurance advisory committees—all of which are among the most sensitive records we retain. And, as we comply, these same records are wide open to public scrutiny under the Freedom of Information Act.

Can it be mere coincidence that this is occurring throughout the country? I think not. Rather, it appears to be a well-orchestrated effort to demoralize America's physicians by neutralizing their professional associations. Pardon my paranoia, but neither do I consider it coincidence that this Federal dragnet comes immediately preceding the introduction of the Administration's National Health Insurance legislation.

It's the same Administration that has excoriated the AMA as a "major obstacle" to developing a BETTER health care system. It's the same Administration that gained page one headlines by decrying last year's 9.3% increase in physicians' fees, but it is also the same Administration that stood by silently when George Meany did but thumbed his nose in reaction to Mr. Carter's request for voluntary wage restraint, and it's the same Administration that had little comment when coalminers recently walked away with what might be a well-deserved 39% wage increase over the next three years. It is also the same Administration that is opposing antitrust exemptions to the AMA, the AHA and Federation of American Hospitals which are striving mightily to contain the costs of hospital care on a voluntary basis. Am I confused, or does this smack of political hypocrisy?

And so we await the unveiling of this *Better* health care system which the Administration has been promising. Enthusiasts of the Carter approach are planning

yet another rally in Madison Square Garden in a few weeks to raise \$5 million in promotional monies. The Administration's drum-thumpers are already publicly forecasting AMA opposition. What they fail to acknowledge is that American medicine supports National Health Insurance to the extent that it is *both* responsive *and* responsible in its approach. The AMA has sponsored comprehensive NHI legislation in the most recent Congresses, dating back to 1970.

The Federal government always promises that magic word *Better*, and yet these benevolent (or is it malevolent?) bureaucrats and legislators have managed to derail Amtrak, bring Social Security to the brink of bankruptcy, and raised our postal rates 150% in less than a decade while simultaneously reducing services. Their countless and often conflicting rules and regulations now cost American business \$103 billion a year.

These financial wizards have also managed to increase the Federal budget a mind-boggling average of 318% annually for each of the past 50 years. Our property taxes have increased 111% in the last decade. Interest alone on the Federal debt costs taxpayers \$936 million each week—EACH WEEK—nearly \$50 billion a year! These are the same friendly folks who have gyped the aged by making a mockery of Medicare. It's reported that our elder citizens now pay as much out of pocket for health services as they did in pre-Medicare days—BETTER?

I know that these remarks may seem unusually harsh at an installation ceremony, but I'm convinced we've already entered one of the most extraordinary eras in our careers as med execs. AAMSE must be ready to assist each of us so that we, in turn, can provide maximum assistance to the profession we are privileged to serve. As your President, I pledge that assistance in the months ahead.

I think we need a national clearinghouse on these subpoena documents and a communications network whereby our respective legal counsels back home can share their strategies. I am also asking our Committee on Continuing Education to consult with AMA on the feasibility of a special national conference on this subject in the near future.

I only wish this unprecedented encroachment could motivate some 40% of the physicians in this country to unify within their county and state societies, and the six in 10 who remain outside the AMA. Never has the profession needed one another more. As med execs, we have both the opportunity and obligation to bring this about. Those of us who have studied the British and

822-1553

Canadian nationalized health systems on-site heard a warning loud and clear from practitioners who are now under the crushing thumb of their federal governments. If you take any message back home, they have said, tell your physicians that we lost the war because we didn't support our medical associations—especially the national association. The government negotiated with us through specialty societies and cut the profession to pieces.

For those of you who haven't had the opportunity to get this message first-hand, take it back home and give it maximum exposure. Med execs are sometimes referred to as the eyes and ears of medicine. To that I would add that we must sometimes also be the conscience of medicine, if we are to help America's physicians preserve the professional freedoms they still retain.

Physicians must also be given the opportunity to demonstrate their concern and commitment to voluntary cost containment. This is one more issue that we in AAMSE need to be addressing in the very near future, if we expect the profession to be held in the same high public esteem that physicians have earned down through the years.

Finally, as the result of last year's membership survey I believe AAMSE has a clear mandate to establish a program of voluntary certification for our members. Tomorrow, I shall ask the AAMSE Board to ratify my appointment of a special committee so that next year at this time, we can announce the availability of a certification program to our members.

I suppose I could leave you with a statement as dramatic as that issued by Abraham Lincoln to a Milwaukee audience in 1859: "Let us have faith that right makes might, and in that faith, let us do our duty as we understand it," but that isn't McManus, so I'll simply say that, like MacNamara's band, although we're few in numbers, we're the finest in the land. □

Physician Preferences for Continuing Medical Education Programs

By CARLTON A. HORNING, PhD

This study was sponsored by the Div. of Biomedical Information Support, Extramural Programs of the National Library of Medicine, Grant LM02456-03. Dr. Horning is in the University of Maryland Dept. of Sociology at College Park, MD 20742, where he can be contacted for reprint and other data. Dr. Horning is also a staff member of the Graduate Medical Education National Advisory Committee of the Health Resources Administration of the Department of HEW, and a candidate for the MPH degree at the Johns Hopkins University School of Hygiene and Public Health.

Abstract

Primary care physicians' evaluations of Continuing Medical Education (CME) programs sponsored by community hospitals, medical societies and medical schools are assessed. The analysis shows that physicians in different primary care specialties have different evaluations of the benefits derived from programs sponsored by various agencies and that these evaluations depend upon whether the physician is seeking information relevant to his or her care of regular patients, exceptional patients or preparation for possible recertification examinations.

An examination of the multitude of CME programs and activities¹ leave one with the impression that there is less than the optimum level of systematic planning and coordination between the various sponsors of these activities (e.g., community hospitals, medical schools and national, state and local medical societies). The overlap of program content suggests a duplication of effort and a competition for participants between organizations sponsoring CME activities. Practicing physicians find themselves faced with a plethora of similar activities to choose from, none of which necessarily correspond to their needs and preferences. To this extent, these programs are an inefficient and perhaps ineffective mechanism for transferring knowledge to physicians and improving the quality of health care they deliver.

Ideally, the first step in organizing any CME activity is identifying the needs of the physicians the activity is to serve. There are several strategies for this including chart audits of hospital or office records, similar review procedures conducted in Quality Assurance Programs or Professional Standards Review,² epidemiological methods, IMP as reported by Wooley and Wooley,³ as well as formal or informal surveys of physicians as to what they perceive their needs to be.⁴⁻⁵ It is not our point to debate the relative advantages and disadvantages of these or other needs-identifying strategies⁶ except to note that an effective strategy determines whether there is a need for CME addressed to the care of regular patients, the care of exceptional patients or, more general education, for example, as preparation for possible recertification examinations. Further, an

effective strategy will also delineate the medical specialty for which the need is greatest as well as the geographic region (i.e., rural or urban physicians) in which the need is most acute. For example, chart audits of hospital records may reveal a problem in the diagnosis or treatment of pediatric pneumonia. This implies a need for CME programs that will convey the relevant knowledge to the appropriate audience; in this case pediatricians, general practitioners, family practitioners and allied health care professionals who are likely to come into contact with the patient.

Once physician needs are identified and delineated, individuals who are responsible for providing CME are confronted with the problem of designing an educational program that will maximize the improvement in patient care. Presumably, this goal will be achieved by optimizing information transfer. This involves attracting the maximum number of physician participants not to mention other health personnel, by designing a CME program that is matched to the preferences of the greatest number of physicians in the target population.

Mason and Kappelman⁷ reported data collected from the directors of CME at the nation's medical schools that is worthy of review in the context of this discussion. They found that 62% of the topics for CME programs that the CME directors considered to be "successful," were designed to meet physician needs as identified by the organizers of the sessions while another 28% addressed needs identified by the participants. In only two instances were programs designed to meet needs identified by chart audit of hospital or office records. Moreover, Mason and Kappelman's data showed that over one-third of these programs were directed towards all practicing physicians, about 25% were directed towards practitioners of a given medical specialty and another 25% were aimed at family practitioners. Further, nearly two-thirds of these "successful" programs were conducted at health science centers while only 18% were offered at local hospitals with nearly an equal amount offered at hotels and resort areas.

The analysis reported here examines practicing physicians' evaluations of CME programs sponsored by various agencies in terms of which agency offers CME programs that they feel are the most beneficial to them in caring for regular patients, exceptional patients and in preparation for possible recertification examinations.

Data and Method

The data reported by Mason and Kappelman in their study of the perceptions of effective CME program among CME directors at the nation's medical schools

were collected as part of a much larger study of the *Information Needs of Practicing Physicians*. The major thrust of the larger project was to determine the utilization patterns and preferences for alternative modalities and programs of CME among physicians in office-based primary care practices.

Lengthy questionnaires were distributed to a random sample of physicians in Maryland who, according to the American Medical Association's Physicians' Records Information System, identified themselves as practicing: family medicine, general practice, internal medicine, general surgery, obstetrics/gynecology, pediatrics or psychiatry. Responses were obtained from 651 office-based physicians which amounted to a response rate of 31%. A detailed examination of respondents vis a vis nonrespondents showed that the responding sample was representative of the population and the contacted sample with respect to medical specialty, type of office practice (i.e., solo, partnership, group, etc.), and geographic location; however, the responding sample was somewhat biased with respect to age. Physicians in the age cohorts 36-45 were underrepresented among respondents, while physicians between the ages of 56-65 were overrepresented (Chi Square "Goodness of Fit" Tests are available from the author upon request).

There may indeed be some latent benefits to be derived from the misrepresentation of the different age cohorts. Although we cannot state definitively why physicians between the ages of 36-45 responded to the survey at a lower rate than expected or why those between the ages of 56-65 responded at a significantly higher rate than expected, we can suggest that older physicians who have been practicing medicine for approximately three decades are more likely than their younger colleagues to feel a need to keep abreast with recent developments in the field of medicine and therefore respond to a time-consuming questionnaire that asks them to evaluate the utility of various modalities of CME (e.g., teaching rounds, video tapes, audio cassettes, computer-assisted instruction, etc.) and to evaluate the potential of these modalities as learning devices in the future. In contrast, younger physicians may

regard themselves as being knowledgeable about the current state of the art by virtue of their recent completion of their medical education, apparently chose not to take time from their busy schedules to spend an hour answering a questionnaire about a topic with which they have had only limited experience and which is not defined by them to be of immediate importance to their practice of medicine. To the extent that this interpretation is accurate, then an overrepresentation of older physicians among respondents is a potential benefit because these are the physicians who are likely to have had the most experience with alternative modalities and sponsors of CME and feel the greatest need to keep abreast of current technological developments. Moreover, by virtue of their experience with CME programs and technologies, they are precursors of the experiences and needs of today's younger physicians.

Results

Table 1 gives the percent of physicians in each primary care specialty who regard the various sponsors as the source of CME activities that are the most beneficial to them for their routine practice of medicine. With the exception of family practitioners and psychiatrists, approximately 40% of primary care physicians evaluate the programs offered by community hospitals as the most beneficial for their routine medical practice; however, other than general practitioners and internists, only about one in four physicians in the other primary care specialties regard medical school-sponsored programs as being the most beneficial. It is noteworthy that local and state medical society-sponsored programs are rarely defined as the best source of CME for regular care. Similarly, "other" sponsors of CME activities, such as private enterprises, are not seen as offering primary care physicians other than psychiatrists programs that are beneficial for routine practice. Perhaps the most noteworthy observation is that general practitioners are quite like internists and quite unlike family practice physicians in their evaluations of the various sponsors. General practitioners, like internists, are about twice as likely as family practice physicians to

see community hospital-sponsored programs as the most beneficial to the care of their regular patients. In contrast, family practitioners are about four times more likely than general practice physicians and three times more likely than internists to look to state and national specialty societies for CME programs for care of their regular patients.

In Table 2 we see the evaluations of sponsors of programs for care of exceptional patients. The pattern of evaluations is generally the same and the magnitude of association is, for all practical purposes, equal. In general, there is a shift away from community hospitals as the source of the most beneficial programs for care of exceptional patients. This shift is most pronounced among surgeons, 40% of whom regard community hospitals as the best source for care of regular patients but only 18% of whom see community hospitals as offering programs that are the most beneficial for treating special problem cases. A similar shift, from 42-26%, is also evident among internists. Only general practitioners and psychiatrists show little change in their evaluation of the benefit of community hospital-sponsored programs. There is also little change in the evaluation of programs sponsored by local and state medical societies. Again, less than 4% of the physicians see these programs as most beneficial, although family practitioners and general practitioners evaluate these programs more favorably than other specialists. While there is also little overall change in the percentage who think specialty societies offer the most beneficial programs for regular and exceptional care, there is a significant shift among family practitioners. For programs that are beneficial for the care of regular patients, 37.1% of the family practice physicians see their state or national specialty society as sponsoring the best programs, but when it comes to programs relevant to the care of exceptional patients, only 16.1% define these societies as the best providers.

The overall decline in the evaluation of community hospital-sponsored programs is concurrent with an increase in the favorable evaluation of medical school-sponsored programs. When it comes to care of problem

cases, more than one-half of the family practitioners, internists and pediatricians, as well as about one-third of the general practitioners and surgeons, and one-quarter of the obstetricians/gynecologists and psychiatrists regard the programs sponsored by medical schools as the most beneficial for their care of special cases. The shift towards medical schools for this kind of CME is particularly strong among family practitioners (29.7%) and pediatricians (21%), while general practitioners and surgeons tend to shift toward "other" sponsors, though not dramatically so.

The final Table shows the evaluation of programs in terms of their benefits for preparing for recertification examinations. Although such examinations may or may not come to be mandatory for all physicians, it is nevertheless important to see how physicians evaluate past programs sponsored by the various agencies in order to anticipate physician preferences if and when recertification examinations become required. We anticipated that medical schools and specialty societies would be the sponsors that physicians would turn to overwhelmingly for CME programs to assist them in preparing for examinations simply because of the role of medical schools and specialty societies as harbingers of medical knowledge. Similarly, we anticipated that physicians would become less dependent on community hospitals and local and state medical societies for programs designed to familiarize them with highly specialized knowledge.

When we compare Tables 2 and 3, we note that these predictions are not entirely accurate. State and local societies lose little of the physician market if only because of the small part of the market they hold for CME designed to meet either needs for the care of regular patients or needs for the care of exceptional patients. The overall shift away from community hospitals is similarly small. In fact, contrary to expectations, surgeons, obstetricians/gynecologists and, especially, pediatricians, are more likely to see community hospitals as the sponsor of the most beneficial preparatory programs than they were to see them as sponsoring the most beneficial programs for special cases. More-

Table 2 :
 Sponsor of the Most Beneficial Programs for Care of Exceptional Patients by Medical Specialty (Percent)

	Family Practice	General Practice	General Surgery	Internal Medicine	Obstetrics/ Gynecology	Pediatrics	Psychiatry	Total (n)
Community Hospitals	12.9	37.0	17.9	25.8	26.0	16.9	16.4	24.2 (136)
Local and State Medical Societies	6.5	9.2	0.0	2.3	3.9	1.3	1.4	3.7 (21)

Medical Schools	54.8	35.3	32.1	50.0	27.3	50.6	23.3	38.9 (218)
Other	9.7	10.1	8.9	3.9	5.2	2.6	30.1	9.4 (53)
Totals (n)	100.0 (31)	100.0 (119)	100.0 (56)	100.0 (128)	100.0 (77)	100.0 (77)	100.0 (73)	100.0 (561)

$X^2 = 118.69, d.f. = 24$
 $p < .001$
 $\lambda = .058$

over, the increase in the percentage of pediatricians regarding community hospital-sponsored programs as most beneficial (16.9%-28.2%) is nearly equal to the decrease in the percentage of pediatricians (50.6%-42.3%) who regard medical school-sponsored programs as the most beneficial.

The absence of clear differences between the evaluation of programs for exceptional care and preparation for recertification examinations probably reflects either confusion physicians feel over if and when recertification examinations will become required, or, an anticipation that any examinations that are required will test medical knowledge pertaining to the care of exceptional patients rather than the routine practice of medicine or the very latest esoteric information. Our anticipation of an increased reliance on medical schools and specialty societies may yet prove to be correct, particularly if either of these institutions come to play a central role in determining the form and content of recertification procedures.

Discussion

The analysis that we have presented only touches one part of the complex problems involved in planning CME programs that will enable physicians to provide better health care. Furthermore, the results must be interpreted with an element of caution owing to the fact that the data on physician evaluations come from only one state and therefore are attitudes formed from experiences with a much smaller number of CME programs than that which formed the basis of the opinions analyzed by Mason and Kappelman; however, it should also be noted that five medical schools and well over 100 community hospitals serve the CME needs of physicians in our survey and, consequently, there is some variance and diversity in the types and quality of programs that form the basis of their evaluations.

To the extent that we can generalize from these data, we can suggest that the perceptions of those responsible for medical school-sponsored programs are not entirely congruent with the perceptions and preferences

of practicing primary care physicians. While one third of the medical school-sponsored programs are aimed at all physicians without regard to their practice specialty, our survey tells us that there are appreciable differences between medical specialties in terms of how they evaluate the benefits of programs sponsored by medical schools and other organizations.

This suggests that directors of CME at medical schools, as well as those at community hospitals and medical societies, can better serve practicing physicians by designing programs that are more "specialty-specific." For example, a distinction is rarely made between family practitioners and general practitioners, while general practitioners are typically distinguished from internists, yet our results indicate that when it comes to CME programs, particularly those that are designed to meet the needs of a physician's routine practice of medicine, the preferences of general practitioners are significantly different from those of family practice physicians, but quite similar to those of internists.

Directors of CME should become sensitive to such patterns and structure their programs accordingly. Furthermore, program directors can plan more appealing programs by being cognizant of what kinds of CME needs physicians look to them to fill, instead of trying to be all things to all doctors.

CONRAD ACTON, MD, Editor

January Meeting

1979's new and highly-charged Board of Directors held its January Meeting on the third Tuesday. Minutes were all right from the December, 1978 Meeting, but the routine of making nominations for the Community Service Award was deferred until more names could be submitted. This Award is made at the Med-Chi Annual Meeting. It recognizes non-medical, community-benefitting works.

A proposal to study Baltimore medical practices in the offices of ALL private practitioners brought lively discussion. Doctoral candidate Jonathan Weiner explained his study outline which is the basis for his doctoral thesis. The health service problem situation, as he sees it is 1) inadequate primary care and 2) an absolute lack of quantitative information about the delivery of primary care by private practitioners due to their decentralization (or independence.)

His study proposes a 100% census of all 4,464 physicians in Baltimore. Initial contact will be by mail. The non-responders will be followed-up. Also, some pre-collected data will be worked in.

Cost is estimated at about \$20,000, without overruns. It will be paid by BCMS and possibly some other agencies including Hopkins University, Med-Chi, the MSHPD Agency and even CMHSA could help.

The Directors were particularly questioning the expected time the study would take and its possible influence on this year's Legislature; how confidentiality would be maintained; methods to avoid bias/skewing of statistical interpretations. The expected response rate was up to about 70%, especially without questions of costs and quality factors.

Mr. Weiner proposed that 12 months should be allotted. He promised that monthly progress reports would be sent. The Directors approved the project.

Legislative Committee

The Legislative Committee had recommendations about upcoming legislation on abortion and on podiatric practice. The Committee feels that it is manifestly unfair, with regard to abortion, to restrict the use of public funds in such a way as to deny services to the poor and permit them to the affluent. This would be the case if welfare funding of abortions were stopped.

The Legislative Committee feels that the Bill broadening the scope of podiatric procedures would encourage practices for which many podiatrists are untrained. It has always been difficult to draw practice boundaries, but "examination, treatment and prevention of diseases, conditions and malfunctions affecting the human foot and its related or governing structures, by employment

of medical, surgical or other means," does seem awfully broad. After all, the brain is a governing structure of the foot as well as the rest of the body.

Another Legislative Committee recommendation attempted to debride some of the red tape connected with autopsies and organ-retrieval. The Board of Directors supported all of the Committee's recommendations.

A quotation in the press derogatory to physicians in general was brought to the Directors' attention. A member of the State Health Services Cost Review Commission is directly quoted in the press release as saying: "Physicians are resisting change because they want to limit competition in order to make more money themselves. . . They don't want to consider alternate ways and the reason they don't want to is economical—they're afraid they won't be able to buy a new Cadillac next year." Such bias by a State official is hazardous to the planning process and to patients to be affected by his logistics in hospitals throughout the state. Ways to offset and correct the effects of this attitude were considered, but none decided upon. Possibly, a logical way would be to have a greater number of physicians on the HSCRC.

Plans for our Annual Meeting in December are already under scrutiny. Sentiment for a location in Baltimore continues strong. Baltimore's new Convention Center's availability is chancy. Costs in other suitable arenas downtown are generally higher than our traffic would seem to bear. Having the meeting and awards at Center Stage was proposed as a change for the better. The meal could be catered. Costs would be about the same as in the past few years. A seasonal play, perhaps *A Christmas Carol*, could be a very added attraction. The Directors approved, and staff was directed to make the arrangements.

Directors Meet

The Directors met on the last Tuesday in January with H. McDonald Rimple, MD, and had a refreshing and open exchange of views. Dr. Rimple is an Assistant Surgeon General and Director of Region III of the Regional Health Administration for HEW. He is ex officio in charge of health planning activity for the mid-Atlantic area, which comprises Pennsylvania, Maryland, Delaware, the District of Columbia, Virginia and West Virginia.

Informal discussion revolved about the roles of individual physicians and of local/state medical societies in the health planning process. The Health Planning and Resources Act (93-641) Dr. Rimple saw as inevitably-changing medical practice. Centering on prevention and cost containment, Dr. Rimple quoted statistics projecting an excess of physicians of about 2,000 as one basic excess cost of medical care. Maldistribution, low minority ratios and high specialization rates were all seen to be contributing factors. Dr. Rimple admitted that the National Guidelines that emanated from Washington often ran contrary to local necessity. He ascribed this to interests within the HSA that overruled its own staff's findings and recommendations. When it was pointed out, for instance, that there are 11 CAT scanners on the NIH campus, while many Baltimore area hospitals were actively denied them, he was hard put to

reconcile this with policies of lower costs and higher quality!

A staunch supporter of HEW Secretary Joseph Califano, Dr. Rimple favors and promotes formation of HMOs to replace fee-for-service practices. Dr. Rimple announced that all the HSAs have now been formed. Their major initiatives at this time are 1) Tracking Systems, 2) immunization programs and 3) Teenage pregnancy.

In the discussion it seemed agreed that the socioeconomic pressures of consumer choice often ran counter to a physician's duty to a patient. Also, the data for evaluating the excess of insufficiency of physicians in any area was patently inadequate. For instance, the area surrounding the University Hospital is officially designated as underserved by primary care physicians, but it has also been held to be too expensive, adding unnecessarily to the cost of medical care, to validate or correct!

The fantastic inconsistency and irrelevance of Health Regulations, and the cost of complying with Health Regulations actually conflicting with one another, each with the status of law until taken to court, was pointed out to Dr. Rimple with chapter and verse. Round and round it went and, while the *goals* of quality care, low cost and supply abundance were acceptable to all, it became obviously a matter of definition and criteria and of reconciling 180° differences about supply and demand at every level of health care delivery.

February Meeting

The first general meeting of the BCMS for 1979 was Feb. 1st. President Albert M. Antlitz, MD called the meeting punctually to order. He announced the recipients of Med-Chi's 40-year Member Certificates, and they were:

Harold C. Dix, MD
Samuel J. Hankin, MD
Robert F. Healy, MD
William G. Helfrich, MD
Albert J. Himelfarb, MD
Manuel Levin, MD
William Kenneth Mansfield, MD
Louis R. Maser, MD
M. Elliott Randolph, MD
Daniel Wilfson, MD

Richard Berkowicz, MD, Chairman of the Professional Relations Committee, reported his Committee's work of the past year. Basically, its charge has to do with reconciling physician-patient differences and misunderstandings. Dr. Berkowicz' statistics included 190 complaints against a total of 117 physicians straightened out by his Committee.

William J. McClafferty, Jr., read the Legislative Committee's report recommending some housekeeping changes in the Bylaws. They were routinely passed and will come up for final action at our next meeting.

President Antlitz reported on the upcoming study of primary care in physicians' offices in Baltimore. Every physician will be expected to participate, initially by questionnaire.

Dr. Glaser Speaks

Kurt Glaser, MD, Associate Professor of both Pediatrics and Psychiatry at the University of Maryland School of Medicine, gave the scientific paper of the Meeting. His presentation on *Depression and Suicide in Adolescents* was well-received. Adolescents he defined as the 15-24 year-old group. If physicians are going to be able to identify adolescents at risk, they must be able to do a "psychological autopsy" on those they advise. With depressed adolescents under therapy, there is a 40% success rate, but this connotes a 60% failure rate in spite of treatment. The number of cases has increased 20% in the past year. They must be diagnosed before they can be treated. Dr. Glaser noted the confusing and conflicting statistics about the significance of such items as drugs, war, peace and religion as the precipitating factors in suicidal depression in adolescents.

Psychoanalytically considered, other causes would be feelings of loss and abandonment by parents and loved ones, loss of childhood and its privileges and changed self-esteem.

Secondly, Dr. Glaser stressed prevention. At regular or annual examinations, the physician must be sensitive to patient communication. He must especially strive to get the patient to verbalize. He must not cut off spontaneous—though seemingly irrelevant—talk. Watch out for non-verbal communication as well. Try to find out what underlies the adolescents' seeming non-sequiturs. Additional insight may be gained by noting mood changes and considering changes in job performance.

Although the physician must be on guard against manipulative adolescents (as well as adults), he may gain some idea of the depth of a depression in various ways. Hostility toward the examiner, or others, and lowering of self-esteem can justly point to gathering depression. Any defensiveness shown is important. History of delinquencies and of temper tantrums, or outbursts against people or things can reveal the presence of pressures too great for the individual to cope with. A sustained drop in school grades and inability to make friends among his peers are significant, too.

Suicidal threats as compared to actual attempts are hard to evaluate as to whether they should be considered real or manipulative. The apparent depth of the depression should be considered in light of the individual's resources, both inner and outer. Also, the degree of situational stress factors should be noted: whether small or large in relation to the patient's reaction to them.

The physician's therapeutic role with adolescents should be to guide and help toward *attainable* goals. Above all, the physician must be *alert*. □

Doctors Take Note: Upcoming Meeting

Emphysematous Cholecystitis

By LEE GOODMAN, MD

Assistant Professor, University of Maryland Hospital

This 38-year-old male presented to the Emergency Room with a one-day history of nausea, vomiting and epigastric pain radiating to the back. On examination, he was noted to have a temperature of 102° F and severe epigastric and right upper-quadrant tenderness. A white blood cell count was 19,500. The following supine

and erect abdominal radiographs were obtained (Figure 1). These were incorrectly interpreted as a "non-specific gas pattern" with gas in the stomach, duodenal cap and colon.

The next morning, a follow-up series of abdominal radiographs was obtained which clearly revealed the

FIGURE 1: Supine and erect films taken on admission.

FIGURE 2: Supine film the following morning showing gas within the gallbladder and outlining the gallbladder.

diagnosis (Figures 2 and 3). What are the radiographic findings, and how would you treat the patient?

1. What is your diagnosis? Differential diagnosis?
2. What further radiographic studies (if any) would you request to confirm this?

Answer on page 66.

THIRD WILLIAM S. BAER LECTURE MAY 2-3, 1979

A lectureship honoring the late Dr. William S. Baer has been established as a memorial to him. Dr. Baer was the first Professor of Orthopedic Surgery at the Johns Hopkins Hospital and a founding father of American orthopedic training. He was the prime force in the establishment of the Children's Hospital in Baltimore.

The third Baer lecturer will be Dr. Frank E. Stinchfield, Head of Department and Professor of Orthopedic Surgery, Columbia-Presbyterian Medical Center, New York. He will arrive in Baltimore on Wed., May 2, 1979 and will be attending the Johns Hopkins Hospital Clinics on Thursday and Friday. He will lecture at 5 PM on Thurs., May 3, 1979 at the Children's Hospital.

The Third Baer Lecture will be on Friday, May 4, 1979 at 5 PM in Hurd Hall at Johns Hopkins Hospital. ☐

FIGURE 3: Oblique film confirming gas within the gallbladder lumen as well as the gallbladder wall.

Case history on pp. 64-65.

Discussion

As noted, the initial films were felt to reveal non-specific gas accumulations within the bowel. The prominent air-fluid level in the right upper-quadrant, however, is a bit too large for the duodenal cap. With a clinical history pointing to gallbladder disease, one should consider that this gas is located within the gallbladder lumen. In addition, on the initial supine film, there is a suggestion of a small, linear streak of gas just lateral to the large bubble. This would suggest gas within the gallbladder wall. On the films the following morning, one can readily note gas within the gallbladder lumen as well as in the gallbladder wall. The diagnosis, therefore, is emphysematous cholecystitis, and surgery is generally recommended.

Emphysematous cholecystitis is virtually impossible to clinically distinguish from the more common, simple, acute cholecystitis. Symptoms are identical, with the possible exception of a more septic presentation and a higher temperature in the emphysematous variety; also, there is a male predilection in emphysematous cholecystitis as opposed to acute cholecystitis' predilection for females. In emphysematous cholecystitis, there is a lesser correlation with gallstones, and a higher percentage of these patients have diabetes mellitus.

Generally, gas can be found in three different locations in the biliary tract: in the gallbladder lumen, in the gallbladder wall and in the bile ducts. The specific location of the gas can provide a clue as to the under-

lying pathology.

Basically, there are three mechanisms for gas accumulation in the biliary tract. The most common is termed an "internal biliary fistula," where there has been a fistulous communication between the gallbladder or common duct and the duodenum or colon. This is seen following erosion of a gallstone through the portion of the biliary tract into the gut. Often, the presence of gas in the biliary tract is an incidental finding on a film taken for a completely unrelated reason. The gas in this process will be confined to the gallbladder lumen or bile duct and not the gallbladder wall.

The second mechanism is for gas to enter the biliary tract through an incompetent sphincter of Oddi. This may be developmental or may be secondary to previous surgical sphincterotomy. This is a benign condition, and, once again, the gas will be confined to bile ducts and gallbladder lumen, depending on patency of the cystic duct.

The third mechanism, that of emphysematous cholecystitis, is the only one in which gas is seen in the wall of the gallbladder as well as the gallbladder lumen. Very rarely, one may find gas in the bile ducts, but this is most unusual. Specifically, it is still unclear why gas accumulates in the wall and lumen of the gallbladder. Certainly, gas-forming organisms play an important role. These organisms include Clostridia, Staphylococcus and Streptococcus. The underlying abnormality, however, may be an obstruction of the cystic duct with resultant distension of the gallbladder, and then ischemia. The increased incidence of this disease in diabetics might suggest that vascular occlusion of the small arteries in the gallbladder play a role in the ischemia.

The diagnosis of emphysematous cholecystitis can usually be made on the plain films alone. When there is a question of whether a suspicious gas bubble is in the bowel or possibly in the gallbladder, oblique films as well as barium studies may be helpful. Gas in the wall of the gallbladder is **NEVER** as insignificant finding. In classic cases, an oral cholecystogram, as well as an intravenous cholangiogram, are unnecessary and would only serve to delay surgery. Regardless, they would be expected to demonstrate "non-visualization of the gallbladder" because of occlusion of the cystic duct.

BROKERS WELCOME

Yours Truly™ by Jobst® – it's only natural.

Finally, a truly natural external breast prosthesis is available to your patients. No need to follow the trauma of a radical mastectomy and associated psychological overlay with an ugly, even grotesque breast prosthesis of unnatural polyvinyl chloride.

Now, with the help of your nurse, Reach to Recovery volunteers, and others, you can suggest to your postmastectomy patients an external breast form that is seamless and natural. The Yours Truly™ breast form is new. Worn right against the skin it requires no special bra to stay in place. It moves with the vitality and flow of a natural breast. The silicone gel inside has a specific gravity of .98, only .04 more dense than human breast tissue and the response in vivo is nearly identical. There are thirteen sizes from which to choose, each with the contour and suppleness of the female breast size it replaces.

Contact your local Jobst Service Center for complete details.

Tenuate®
(diethylpropion hydrochloride NF)

Tenuate Dospan®
(diethylpropion hydrochloride NF) controlled-release

AVAILABLE ONLY ON PRESCRIPTION

Brief Summary

INDICATION: Tenuate and Tenuate Dospan are indicated in the management of exogenous obesity as a short-term adjunct (a few weeks) in a regimen of weight reduction based on caloric restriction. The limited usefulness of agents of this class should be measured against possible risk factors inherent in their use such as those described below.

CONTRAINDICATIONS: Advanced arteriosclerosis, hyperthyroidism, known hypersensitivity, or idiosyncrasy to the sympathomimetic amines, glaucoma, agitated states. Patients with a history of drug abuse. During or within 14 days following the administration of monoamine oxidase inhibitors, (hypertensive crises may result).

WARNINGS: If tolerance develops, the recommended dose should not be exceeded in an attempt to increase the effect; rather, the drug should be discontinued. Tenuate may impair the ability of the patient to engage in potentially hazardous activities such as operating machinery or driving a motor vehicle, the patient should therefore be cautioned accordingly. **Drug Dependence:** Tenuate has some chemical and pharmacologic similarities to the amphetamines and other related stimulant drugs that have been extensively abused. There have been reports of subjects becoming psychologically dependent on diethylpropion. The possibility of abuse should be kept in mind when evaluating the desirability of including a drug as part of a weight reduction program. Abuse of amphetamines and related drugs may be associated with varying degrees of psychologic dependence and social dysfunction which, in the case of certain drugs, may be severe. There are reports of patients who have increased the dosage to many times that recommended. Abrupt cessation following prolonged high dosage administration results in extreme fatigue and mental depression, changes are also noted on the sleep EEG. Manifestations of chronic intoxication with anorectic drugs include severe dermatoses, marked insomnia, irritability, hyperactivity, and personality changes. The most severe manifestation of chronic intoxications is psychosis, often clinically indistinguishable from schizophrenia. **Use in Pregnancy:** Although rat and human reproductive studies have not indicated adverse effects, the use of Tenuate by women who are pregnant or may become pregnant requires that the potential benefits be weighed against the potential risks. **Use in Children:** Tenuate is not recommended for use in children under 12 years of age.

PRECAUTIONS: Caution is to be exercised in prescribing Tenuate for patients with hypertension or with symptomatic cardiovascular disease, including arrhythmias. Tenuate should not be administered to patients with severe hypertension. Insulin requirements in diabetes mellitus may be altered in association with the use of Tenuate and the concomitant dietary regimen. Tenuate may decrease the hypotensive effect of guanethidine. The least amount feasible should be prescribed or dispensed at one time in order to minimize the possibility of overdose. Reports suggest that Tenuate may increase convulsions in some epileptics. Therefore, epileptics receiving Tenuate should be carefully monitored. Titration of dose or discontinuance of Tenuate may be necessary.

ADVERSE REACTIONS: **Cardiovascular:** Palpitation, tachycardia, elevation of blood pressure, precordial pain, arrhythmia. One published report described T-wave changes in the ECG of a healthy young male after ingestion of diethylpropion hydrochloride. **Central Nervous System:** Overstimulation, nervousness, restlessness, dizziness, jitteriness, insomnia, anxiety, euphoria, depression, dysphoria, tremor, dyskinesia, mydriasis, drowsiness, malaise, headache; rarely psychotic episodes at recommended doses. In a few epileptics an increase in convulsive episodes has been reported. **Gastrointestinal:** Dryness of the mouth, unpleasant taste, nausea, vomiting, abdominal discomfort, diarrhea, constipation, other gastrointestinal disturbances. **Allergic:** Urticaria, rash, ecchymosis, erythema. **Endocrine:** Impotence, changes in libido, gynecomastia, menstrual upset. **Hematopoietic System:** Bone marrow depression, agranulocytosis, leukopenia. **Miscellaneous:** A variety of miscellaneous adverse reactions has been reported by physicians. These include complaints such as dyspnea, hair loss, muscle pain, dysuria, increased sweating, and polyuria.

DOSE AND ADMINISTRATION: Tenuate (diethylpropion hydrochloride): One 25 mg. tablet three times daily, one hour before meals, and in mid-evening if desired to overcome night hunger. Tenuate Dospan (diethylpropion hydrochloride) controlled-release: One 75 mg. tablet daily, swallowed whole, in midmorning. Tenuate is not recommended for use in children under 12 years of age.

OVERDOSAGE: Manifestations of acute overdose include restlessness, tremor, hyperreflexia, rapid respiration, confusion, assaultiveness, hallucinations, panic states. Fatigue and depression usually follow the central stimulation. Cardiovascular effects include arrhythmias, hypertension or hypotension and circulatory collapse. Gastrointestinal symptoms include nausea, vomiting, diarrhea, and abdominal cramps. Overdose of pharmacologically similar compounds has resulted in fatal poisoning, usually terminating in convulsions and coma. Management of acute Tenuate intoxication is largely symptomatic and includes lavage and sedation with a barbiturate. Experience with hemodialysis or peritoneal dialysis is inadequate to permit recommendation in this regard. Intravenous phentolamine (Regitine®) has been suggested on pharmacologic grounds for possible acute, severe hypertension, if this complicates Tenuate overdose.

Merrell

0-3921 (TS87A)

**Whether overweight is a
complicating factor...
or just uncomplicated overweight.**

Tenuate[®] Dospan[®] ^{IV} **(diethylpropion hydrochloride NF)** **75 mg. controlled-release tablets**

A useful short-term adjunct in an indicated weight loss program.

Overweight patients in certain diagnostic categories often require strict obesity control. Diethylpropion hydrochloride has been reported useful in obese patients with hypertension, symptomatic cardiovascular disease, or diabetes. While it is not suggested that Tenuate in any way reduces these complications in the overweight, it may have a useful place as a short-term adjunct in a prescribed dietary regimen. (Tenuate should not be administered to patients with severe hypertension; see additional Warnings and Precautions on the opposite page.)

In uncomplicated obesity.

Many patients, on the other hand, present with excess fat but no disease. While this condition is often termed uncomplicated obesity, complications of both a social and a psychologic nature may be distressingly real for the patients. In these cases, a short-term regimen of Tenuate can help reinforce your dietary counsel during the important early weeks of an indicated weight loss program.

Clinical effectiveness.

The anorexic effectiveness of diethylpropion hydrochloride is well documented. No less than 16 separate double-blind, placebo-controlled studies attest to its usefulness in daily practice¹ And the unique chemistry of Tenuate provides "...anorexic potency with minimal overt central nervous system or cardiovascular stimulation."² Compared with the amphetamines, diethylpropion has minimal potential for abuse.

**Tenuate—it makes sense.
And it's responsible medicine.**

Merrell

For prescribing information see opposite page.

Important data on the pain of acute cystitis:

In 87% of patients studied (303 of 349), Azo Gantanol® reduced pain and/or burning within 24 hours*

A controlled, multicenter study assessed the efficacy of Azo Gantanol in relieving pain and/or burning associated with acute urinary tract infection in patients with at least 100,000 colonies per ml of a sulfonamide-sensitive organism, usually *E. coli*. In 87% of patients with initial symptoms rated "moderate to severe," Azo Gantanol therapy resulted in improvement within 24 hours.

Fast pain relief plus effective antibacterial action

Azo Gantanol®

Each tablet contains 0.5 Gm sulfamethoxazole and 100 mg phenazopyridine HCl.

for
the pain

for
the pathogens

Before prescribing, please consult complete product information, a summary of which follows:
Indications: In adults, urinary tract infections complicated by pain (primarily pyelonephritis, pyelitis and cystitis) due to susceptible organisms (usually *E. coli*, *Klebsiella-Aerobacter*, *Staphylococcus aureus*, *Proteus mirabilis*, and, less frequently, *Proteus vulgaris*) in the absence of obstructive uropathy or foreign bodies. **Note:** fully coordinate *in vitro* sulfonamide sensitivity tests with bacteriologic and clinical response; aminobenzoic acid to follow-up culture media; increasing frequency of resistant organisms to the usefulness of antibacterials including sulfonamides. Measure sulfonamide blood level; variations may occur; 20 mg/100 ml should be maximum total level.

Contraindications: Children below age 12; sulfonamide hypersensitivity; pregnancy at term during nursing period; because Azo Gantanol contains phenazopyridine hydrochloride it is contraindicated in glomerulonephritis, severe hepatic uremia, and pyelonephritis of pregnancy with disturbances.

Warnings: Safety during pregnancy not established. Deaths from hypersensitivity reactions, agranulocytosis, aplastic anemia and other blood dyscrasias have been reported and early clinical signs (throat, fever, pallor, purpura or jaundice) may indicate serious blood disorders. Frequent CBC and urinalysis with microscopic examination are recommended during sulfonamide therapy.

Precautions: Use cautiously in patients with impaired renal or hepatic function, severe allergic bronchial asthma; in glucose-6-phosphate dehydrogenase-deficient individuals in whom dose-related hemolysis may occur. Maintain adequate fluid intake to prevent crystalluria or stone formation.

Adverse Reactions: *Blood dyscrasias* (agranulocytosis, aplastic anemia, thrombocytopenia, leukopenia, hemolytic anemia, purpura, hypoprothrombinemia and methemoglobinemia); *allergic reactions* (erythema multiforme, skin eruptions, Stevens-Johnson syndrome, epidermal necrolysis, urticaria, serum sickness, pruritus, exfoliative dermatitis, anaphylactoid reactions, periorbital edema, conjunctival and scleral injection, anaphylaxis, sensitization, arthralgia and allergic myocarditis); *G.I. reactions* (nausea, emesis, abdominal pain, hepatitis, diarrhea, anorexia, pancreatitis, stomatitis); *CNS reactions* (headache, peripheral neuritis, mental depression, convulsions, hallucinations, tinnitus, vertigo and insomnia); *miscellaneous reactions* (drug fever, chills, nephrosis with oliguria and anuria, periarteritis nodosa and L. E. phenomenon). Due to chemical similarities with some goitrogens, uretics (acetazolamide, thiazides) and oral glycosidic agents, sulfonamides have caused instances of goiter production, diuresis and glycosuria. Cross-sensitivity with these agents may exist.

Dosage: Azo Gantanol is intended for the painful phase of urinary tract infections. **Adult dosage:** 2 Gm (4 tabs) initially, then (2 tabs) B.I.D. for up to 3 days. If pain persists causes other than infection should be sought. After relief of pain has been obtained, continued treatment with Gantanol (sulfamethoxazole) may be considered.

NOTE: Patients should be told that the orange dye (phenazopyridine HCl) will color the urine.

Supplied: Tablets, red, film-coated, each containing 0.5 Gm sulfamethoxazole and 100 mg phenazopyridine HCl—bottles of 100 and 500.

able to do more...**

with symptomatic relief of moderate anxiety with depression

Rapid relief of the symptoms of moderate anxiety in many patients

The tranquilizer component alleviates symptoms of anxiety and agitation within a few days, without apparent dulling of mental acuity. Hypnotic effects from the tranquilizer component appear to be minimal, particularly in patients permitted to remain active. However, TRIAVIL may impair mental and/or physical abilities required for the performance of hazardous tasks.

Highly effective antidepressant action

The antidepressant component relieves symptoms of depression such as poor concentration and feelings of hopelessness as well as early morning awakening; adequate relief of symptoms may take a few weeks or even longer.

Increased activity potential often results from symptomatic relief

As the symptoms of anxiety and depression respond to TRIAVIL, many patients may show renewed interest in family and recreational activities and are able to function more effectively at work.

More prescribing convenience

For optimal flexibility there are now *five* tablet strengths of TRIAVIL for ease of dosage adjustment. For initial management of patients with moderate anxiety and depression, one TRIAVIL® 2-25, containing 2 mg perphenazine and 25 mg amitriptyline HCl, t.i.d. may often be adequate. TRIAVIL® 4-50, containing 4 mg perphenazine and 50 mg amitriptyline HCl, provides b.i.d. convenience for those patients needing the larger total daily dose of 8 mg perphenazine and 100 mg amitriptyline HCl as initial or maintenance therapy.

Treatment with TRIAVIL— a balanced view:

TRIAVIL is contraindicated in CNS depression from drugs, in the presence of evidence of bone marrow depression, and in patients hypersensitive to phenothiazines or amitriptyline. It should not be used during the acute recovery phase following myocardial infarction or in patients who have received an MAOI within two weeks. Patients with cardiovascular disorders should be watched closely. Not recommended in children or during pregnancy. TRIAVIL may impair mental and/or physical abilities required for performance of hazardous tasks and may enhance the response to alcohol. Antiemetic effect may obscure toxicity due to overdose of other drugs or mask other disorders. The possibility of suicide in depressed patients remains until significant remission occurs. Such patients should not have access to large quantities of the drug. Hospitalize as soon as possible any patient suspected of having taken an overdose.

For moderate
anxiety with depression

More dosage strengths
than any other formulation containing
a tranquilizer and an antidepressant

Dual-action Triavil®

containing perphenazine and amitriptyline HCl

Available:

TRIAVIL® 2-25: Each tablet contains
2 mg perphenazine and 25 mg amitriptyline HCl.
TRIAVIL® 2-10: Each tablet contains
2 mg perphenazine and 10 mg amitriptyline HCl.
TRIAVIL® 4-50: Each tablet contains
4 mg perphenazine and 50 mg amitriptyline HCl.
TRIAVIL® 4-25: Each tablet contains
4 mg perphenazine and 25 mg amitriptyline HCl.
TRIAVIL® 4-10: Each tablet contains
4 mg perphenazine and 10 mg amitriptyline HCl.

CONTRAINDICATIONS: Central nervous system depression from drugs (barbiturates, alcohol, narcotics, analgesics, antihistamines); evidence of bone marrow depression; known hypersensitivity to phenothiazines or amitriptyline. Should not be given concomitantly with a monoamine oxidase inhibitor since hyperpyretic crises, severe convulsions, and deaths have occurred from such combinations. When used to replace a monoamine oxidase inhibitor, allow a minimum of 14 days to elapse before initiating therapy with TRIAVIL. Therapy should then be initiated cautiously with gradual increase in dosage until optimum response is achieved. Not recommended for use during acute recovery phase following myocardial infarction.

WARNINGS: TRIAVIL should not be given concomitantly with guanethidine or similarly acting compounds since TRIAVIL may block the antihypertensive action of such compounds. Use cautiously in patients with history of urinary retention, angle-closure glaucoma, increased intraocular pressure, or convulsive disorders. Dosage of anticonvulsive agents may have to be increased. In patients with angle-closure glaucoma, even average doses may precipitate an attack. Patients with cardiovascular disorders should be watched closely. Tricyclic antidepressants, including amitriptyline HCl, have been reported to produce arrhythmias, sinus tachycardia, and prolongation of conduction time, particularly in high doses. Myocardial infarction and stroke have been reported with tricyclic antidepressant drugs. Close supervision is required for hyperthyroid patients or those receiving thyroid medication. May impair mental and/or physical abilities required for performance of hazardous tasks, such as operating machinery or driving a motor vehicle. In patients who use alcohol excessively, potentiation may increase the danger inherent in any suicide attempt or overdosage. Not recommended in children or during pregnancy.

PRECAUTIONS: Suicide is a possibility in depressed patients and may remain until significant remission occurs. Such patients should not have access to large quantities of this drug.

Perphenazine: Should not be used indiscriminately. Use with caution in patients who have previously exhibited severe adverse reactions to other phenothiazines. Likelihood of some untoward actions is greater with high doses. Closely supervise with any dosage. The antiemetic effect of perphenazine may obscure signs of toxicity due to overdosage of other drugs or make more difficult the diagnosis of disorders such as brain tumor or intestinal obstruction. A significant, not otherwise explained, rise in body temperature may suggest individual intolerance to perphenazine, in which case discontinue.

If hypotension develops, epinephrine should not be employed, as its action is blocked and partially reversed by perphenazine. Phenothiazines may potentiate the action of central nervous system depressants (opiates, analgesics, antihistamines, barbiturates, alcohol) and atropine. In concurrent therapy with any of these, TRIAVIL should be given in reduced dosage. May also potentiate the action of heat and phosphorous insecticides. There is sufficient experimental evidence to conclude that chronic administration of antipsychotic drugs which increase prolactin secretion has the potential to induce mammary neoplasms in rodents under the appropriate conditions. There are recognized differences in the physiological role of prolactin between rodents and humans. Since there are, at present, no adequate epidemiological studies, the relevance to human mammary cancer risk from prolonged exposure to perphenazine and other antipsychotic drugs is not known.

Amitriptyline: In manic-depressive psychosis, depressed patients may experience a shift toward the manic phase if they are treated with an antidepressant. Patients with paranoid symptomatology may have an exaggeration of such symptoms. The tranquilizing effect of TRIAVIL seems to reduce the likelihood of this effect. When amitriptyline HCl is given with anticholinergic agents or sympathomimetic drugs, including epinephrine combined with local anesthetics, close supervision and careful adjustment of dosages are required. Paralytic ileus may occur in patients taking tricyclic antidepressants in combination with anticholinergic-type drugs.

Caution is advised if patients receive large doses of ethchlorvynol concurrently. Transient delirium has been reported in patients who were treated with 1 g of ethchlorvynol and 75-150 mg of amitriptyline HCl.

Amitriptyline HCl may enhance the response to alcohol and the effects of barbiturates and other CNS depressants.

Concurrent administration of amitriptyline HCl and electroshock therapy may increase the hazards associated with such therapy. Such treatment should be limited to patients for whom it is essential. Discontinue several days before elective surgery if possible. Elevation and lowering of blood sugar levels have both been reported. Use with caution in patients with impaired liver function.

ADVERSE REACTIONS: Similar to those reported with either constituent alone.

Perphenazine: Extrapyramidal symptoms (opisthotonus, oculogyric crisis, hyperreflexia, dystonia, akathisia, acute dyskinesia, ataxia, parkinsonism) have been reported and can usually be controlled by the concomitant use of effective antiparkinsonian drugs and/or by reduction in dosage, but sometimes persist after discontinuation of the phenothiazine.

Tardive dyskinesia may appear in some patients on long-term therapy or may occur after drug therapy with phenothiazines and related agents has been discontinued. The risk appears to be greater in elderly patients on high-dose therapy, especially females. Symptoms are persistent and in some patients appear to be irreversible. The syndrome is characterized by rhythmical involuntary movements of the tongue, face, mouth, or jaw. Involuntary movements of the extremities sometimes occur. There is no known treatment for tardive dyskinesia; antiparkinsonism agents usually do not alleviate the symptoms. It is advised that all antipsychotic agents be discontinued if the above symptoms appear. If treatment is reinstituted, or dosage of the particular drug increased, or another drug substituted, the syndrome may be masked. Fine vermicular movements of the tongue may be an early sign of the syndrome. The full-blown syndrome may not develop if medication is stopped when lingual vermiculation appears.

Other side effects are skin disorders (photosensitivity, itching, erythema, urticaria, eczema, up to exfoliative dermatitis); other allergic reactions (asthma, laryngeal edema, angioneurotic edema, anaphylactoid reactions); peripheral edema; reversed epinephrine effect; hyperglycemia; endocrine disturbances (lactation, galactorrhea, gynecomastia, disturbances of menstrual cycle); altered cerebrospinal fluid proteins; paradoxical excitement; hypertension, hypotension, tachycardia, and ECG abnormalities (quinidine-like effect); reactivation of psychotic processes; catatonic-like states; autonomic reactions, such as dry mouth or salivation, headache, anorexia, nausea, vomiting, constipation, obstipation, urinary frequency or incontinence, blurred vision, nasal congestion, and a change in pulse rate; other adverse reactions reported with various phenothiazine compounds, but not with perphenazine, include grand mal convulsions, cerebral edema, polyphagia, pigmentary retinopathy, photophobia, skin pigmentation, and failure of ejaculation.

The phenothiazine compounds have produced blood dyscrasias (pancytopenia, thrombocytopenic purpura, leukopenia, agranulocytosis, eosinophilia); and liver damage (jaundice, biliary stasis).

Pigmentation of the cornea and lens has been reported to occur after long-term administration of some phenothiazines. Although it has not been reported in patients receiving TRIAVIL, the possibility that it might occur should be considered.

Hypnotic effects, lassitude, muscle weakness, and mild insomnia have also been reported.

Amitriptyline: Note: Listing includes a few reactions not reported for this drug, but which have occurred with other pharmacologically similar tricyclic antidepressant drugs and must be considered when amitriptyline is administered. **Cardiovascular:** Hypotension; hypertension; tachycardia; palpitation; myocardial infarction; arrhythmias; heart block; stroke. **CNS and Neuromuscular:** Confusional states; disturbed concentration; disorientation; delusions; hallucinations; excitement; anxiety; restlessness; insomnia; nightmares; numbness, tingling, and paresthesias of the extremities; peripheral neuropathy; incoordination; ataxia; tremors; seizures; alteration in EEG patterns; extrapyramidal symptoms; tinnitus; syndrome of inappropriate ADH (antidiuretic hormone) secretion. **Anticholinergic:** Dry mouth; blurred vision; disturbance of accommodation; increased intraocular pressure; constipation; paralytic ileus; urinary retention; dilatation of urinary tract. **Allergic:** Skin rash; urticaria; photosensitization; edema of face and tongue. **Hematologic:** Bone marrow depression including agranulocytosis; leukopenia; eosinophilia; purpura; thrombocytopenia. **Gastrointestinal:** Nausea; epigastric distress; vomiting; anorexia; stomatitis; peculiar taste; diarrhea; parotid swelling; black tongue. Rarely hepatitis (including altered liver function and jaundice). **Endocrine:** Testicular swelling and gynecomastia in the male; breast enlargement and galactorrhea in the female; increased or decreased libido; elevated or lowered blood sugar levels. **Other:** Dizziness, weakness; fatigue; headache; weight gain or loss; increased perspiration; urinary frequency; mydriasis; drowsiness; alopecia. **Withdrawal Symptoms:** Abrupt cessation after prolonged administration may produce nausea, headache, and malaise. These are not indicative of addiction.

OVERDOSAGE: All patients suspected of having taken an overdosage should be admitted to a hospital as soon as possible. Treatment is symptomatic and supportive. However, the intravenous administration of 1-3 mg of physostigmine salicylate is reported to reverse the symptoms of tricyclic antidepressant poisoning. Because physostigmine is rapidly metabolized, the dosage of physostigmine should be repeated as required particularly if life-threatening signs such as arrhythmias, convulsions, and deep coma recur or persist after the initial dosage of physostigmine. On this basis, in severe overdosage with perphenazine-amitriptyline combinations, symptomatic treatment of central anticholinergic effects with physostigmine salicylate should be considered.

MSD
MERCK
SHARP
& DOHME

Dyazide[®]

Each capsule contains 50 mg. of Dyrenium[®] (brand of triamterene) and 25 mg. of hydrochlorothiazide.

Makes Sense in Hypertension^{*}

Before prescribing, see complete prescribing information in SK&F Co. literature or PDR. A brief summary follows:

*** Warning**

This drug is not indicated for initial therapy of edema or hypertension. Edema or hypertension requires therapy titrated to the individual. If this combination represents the dosage so determined, its use may be more convenient in patient management. Treatment of hypertension and edema is not static, but must be reevaluated as conditions in each patient warrant.

Contraindications: Further use in anuria, progressive renal or hepatic dysfunction, hyperkalemia. Pre-existing elevated serum potassium. Hypersensitivity to either component or other sulfonamide-derived drugs.

Warnings: Do not use potassium supplements, dietary or otherwise, unless hypokalemia develops or dietary intake of potassium is markedly impaired. If supplementary potassium is needed, potassium tablets should not be used. Hyperkalemia can occur, and has been associated with cardiac irregularities. It is more likely in the severely ill, with urine volume less than one liter/day, the elderly and diabetics with suspected or confirmed renal insufficiency. Periodically, serum K⁺ levels should be determined. If hyperkalemia develops, substitute a thiazide alone, restrict K⁺ intake. **Associated widened QRS complex or arrhythmia requires prompt additional therapy.** Thiazides cross the placental barrier and appear in cord blood. Use in pregnancy requires weighing anticipated benefits against possible hazards, including fetal or neonatal jaundice, thrombocytopenia, other adverse reactions seen in adults. Thiazides appear and triamterene may appear in breast milk. If their use is essential, the patient should stop nursing. Adequate information on use in children is not available.

Precautions: Do periodic serum electrolyte determinations (particularly important in patients vomiting excessively or receiving parenteral fluids). Periodic BUN and serum creatinine determinations should be made, especially in the elderly, diabetics or those with suspected or confirmed renal insufficiency. Watch for signs of impending coma in severe liver disease. If spiro-nolactone is used concomitantly, determine serum K⁺ frequently; both can cause K⁺ retention and elevated serum K⁺. Two deaths have been reported with such concomitant therapy (in one, recommended dosage was exceeded, in the other serum electrolytes were not properly monitored). Observe regularly for possible blood dyscrasias, liver damage, other idiosyncratic reactions. Blood dyscrasias have been reported in patients receiving triamterene, and leukopenia, thrombocytopenia, agranulocytosis, and aplastic anemia have been reported with thiazides. Triamterene is a weak folic acid antagonist. Do periodic blood studies in cirrhotics with splenomegaly. Antihypertensive effect may be enhanced in post-sympathectomy patients. Use cautiously in surgical patients. The following may occur: transient elevated BUN or creatinine or both, hyperglycemia and glycosuria (diabetic insulin requirements may be altered), hyperuricemia and gout, digitalis intoxication (in hypokalemia), decreasing alkali reserve with possible metabolic acidosis. 'Dyazide' interferes with fluorescent measurement of quinidine.

Adverse Reactions: Muscle cramps, weakness, dizziness, headache, dry mouth; anaphylaxis, rash, urticaria, photosensitivity, purpura, other dermatological conditions; nausea and vomiting, diarrhea, constipation, other gastrointestinal disturbances. Necrotizing vasculitis, paresthesias, icterus, pancreatitis, xanthopsia and, rarely, allergic pneumonitis have occurred with thiazides alone.

Supplied: Bottles of 100 and 1000 capsules; Single Unit Packages of 100 (intended for institutional use only).

...in the functional bowel/irritable bowel syndrome*

Bentyl[®]

(dicyclomine hydrochloride USP)

10 mg. capsules, 20 mg. tablets,
10 mg./5 ml. syrup, 10 mg./ml. injection

helps control abnormal motor activity
with minimal anticholinergic side effects†

Demonstrated smooth muscle relaxant activity.

In this double-blind study, twenty patients having G.I. series and exhibiting spasm were randomly selected to receive either 2 cc. of Bentyl or sodium chloride intramuscularly. Ten minutes after the injection another radiograph was taken . . .

. . . Bentyl produced definite relaxation in 8 of 10 patients. The sodium chloride produced relaxation in only 3 of 10. No side effects occurred in either group of patients.

Pylorospasm has almost totally blocked passage of barium meal.

Barium meal beginning to pass 10 minutes after intramuscular injection of 20 mg. Bentyl.

"The correlation of spasm relief and drug given was excellent."

*This drug has been classified "probably" effective in treating functional bowel/irritable bowel syndrome.

†See Warnings, Precautions and Adverse Reactions.

See following page for prescribing information.

Merrell

Bentyl®**(dicyclomine hydrochloride USP)**

Capsules, Tablets, Syrup, Injection

AVAILABLE ONLY ON PRESCRIPTION

Brief Summary

INDICATIONS

Based on a review of this drug by the National Academy of Sciences—National Research Council and/or other information, FDA has classified the following indications as "probably" effective:

For the treatment of functional bowel/irritable bowel syndrome (irritable colon, spastic colon, mucous colitis) and acute enterocolitis.

THESE FUNCTIONAL DISORDERS ARE OFTEN RELIEVED BY VARYING COMBINATIONS OF SEDATIVE, REASSURANCE, PHYSICIAN INTEREST, AMELIORATION OF ENVIRONMENTAL FACTORS.

For use in the treatment of infant colic (syrup).

Final classification of the less-than-effective indications requires further investigation.

CONTRAINDICATIONS: Obstructive uropathy (for example, bladder neck obstruction due to prostatic hypertrophy); obstructive disease of the gastrointestinal tract (as in achalasia, pyloroduodenal stenosis); paralytic ileus, intestinal atony of the elderly or debilitated patient; unstable cardiovascular status in acute hemorrhage; severe ulcerative colitis; toxic megacolon complicating ulcerative colitis; myasthenia gravis. **WARNINGS:** In the presence of a high environmental temperature, heat prostration can occur with drug use (fever and heat stroke due to decreased sweating). Diarrhea may be an early symptom of incomplete intestinal obstruction, especially in patients with ileostomy or colostomy. In this instance treatment with this drug would be inappropriate and possibly harmful. Bentyl may produce drowsiness or blurred vision. In this event, the patient should be warned not to engage in activities requiring mental alertness such as operating a motor vehicle or other machinery or perform hazardous work while taking this drug. **PRECAUTIONS:** Although studies have failed to demonstrate adverse effects of dicyclomine hydrochloride in glaucoma or in patients with prostatic hypertrophy, it should be prescribed with caution in patients known to have or suspected of having glaucoma or prostatic hypertrophy. Use with caution in patients with: Autonomic neuropathy. Hepatic or renal disease. Ulcerative colitis. Large doses may suppress intestinal motility to the point of producing a paralytic ileus and the use of this drug may precipitate or aggravate the serious complication of toxic megacolon. Hyperthyroidism, coronary heart disease, congestive heart failure, cardiac arrhythmias, and hypertension. Hiatal hernia associated with reflux esophagitis since anticholinergic drugs may aggravate this condition.

Do not rely on the use of the drug in the presence of complication of biliary tract disease. Investigate any tachycardia before giving anticholinergic (atropine-like) drugs since they may increase the heart rate. With overdosage, a curare-like action may occur. **ADVERSE REACTIONS:** Anticholinergics/antispasmodics produce certain effects which may be physiologic or toxic depending upon the individual patient's response. The physician must delineate these. Adverse reactions may include xerostomia; urinary hesitancy and retention; blurred vision and tachycardia; palpitations; mydriasis; cycloplegia; increased ocular tension; loss of taste; headache; nervousness; drowsiness; weakness; dizziness; insomnia; nausea; vomiting; impotence; suppression of lactation; constipation; bloated feeling; severe allergic reaction or drug idiosyncrasies including anaphylaxis; urticaria and other dermal manifestations; some degree of mental confusion and/or excitement, especially in elderly persons; and decreased sweating. With the injectable form there may be a temporary sensation of lightheadedness and occasionally local irritation. **DOSEAGE AND ADMINISTRATION:** Dosage must be adjusted to individual patient's needs.

Usual Dosage: Bentyl 10 mg. capsule and syrup: **Adults:** 1 or 2 capsules or teaspoonfuls syrup three or four times daily. **Children:** 1 capsule or teaspoonful syrup three or four times daily. **Infants:** ½ teaspoonful syrup three or four times daily. (May be diluted with equal volume of water.) Bentyl 20 mg.: **Adults:** 1 tablet three or four times daily. Bentyl Injection: **Adults:** 2 ml. (20mg) every four to six hours intramuscularly only. **NOT FOR INTRAVENOUS USE.** **MANAGEMENT OF OVERDOSE:** The signs and symptoms of overdose are headache, nausea, vomiting, blurred vision, dilated pupils, hot, dry skin, dizziness, dryness of the mouth, difficulty in swallowing, CNS stimulation. Treatment should consist of gastric lavage, emetics, and activated charcoal. Barbiturates may be used either orally or intramuscularly for sedation but they should not be used if Bentyl with Phenobarbital has been ingested. If indicated, parenteral cholinergic agents such as Urecholine® (bethanechol chloride USP) should be used.

Product Information as of October, 1978.

Guidelines for Physicians Attending Patients In Long-Term Care Facilities

Foreword

Physicians attending patients in long-term care facilities are responsible for the delivery and maintenance of quality medical and health care for their patients. These physicians accept and discharge their responsibilities in conjunction with the patient care and administrative policies of the facility.

To assist physicians and long-term care facilities in providing high quality health care, the House of Delegates of the American Medical Association on two previous occasions adopted reports by the Council on Medical Service dealing with this subject. In 1959, the House adopted **Guidelines for Medical Care in Nursing Homes and Related Facilities** and in 1973, a report titled **Guidelines for a Medical Director in a Long-Term Care Facility**.

The 1973 report recommended that "Long-term care facilities should have either a medical director and/or an organized medical staff," and included guidelines for a medical director in a long-term care facility suggesting duties that he should fulfill. These guidelines recognized that physicians with patients in a long-term care facility seldom organize themselves into a formal medical staff and that where a medical director has been appointed in a nursing home, he ordinarily has functions that in the hospital are performed by an organized medical staff.

Skilled nursing facilities participating in Medicare and/or Medicaid as of January, 1976, are required to retain a physician to serve as a part-time or a full-time medical director. Federal regulations state that "If the facility has an organized medical staff, the

medical director is designated by the medical staff with the approval of the governing body." The Council on Medical Service believes that, in order to achieve more physician involvement in nursing

home care and to implement the medical director requirement for skilled nursing facilities, it is important to identify more clearly the responsibilities of physicians attending patients in these facilities.

Guidelines

These Guidelines, which were adopted by the AMA House of Delegates in December, 1977, are designed to clarify the role of attending physicians in long-term care facilities, to help them achieve high quality care for their patients and to assist them in working with the medical director in developing policies affecting patient care. They are intended to supplement the 1973 **Guidelines for a Medical Director in a Long-Term Care Facility** and to replace the earlier 1959 report. They should, of course, be taken as general suggestions only, and will need to be adapted to local conditions.

1. Each licensed physician admitting patients to the long-term care facility should observe its patient care policies, including those governing the provision of physician services if they do not conflict with accepted and established methods of care. The final decision on admitting privileges to the facility rests with the governing body.

2. Each physician seeking to admit a patient should obtain the administrator's consent.

3. It is important that each physician admitting patients provide such information as may be necessary to assure the protection of other patients and the facility's administration from those patient who are or may become a source of danger.

4. Each attending physician should designate an alternate phy

Division of Richardson-Merrell Inc.
Cincinnati, Ohio 45215, U.S.A.

sician or should advise his physician exchange of who may be called to see his patients for regular or emergency care when the attending physician is not available. In the event that neither the attending physician nor the designated alternate physician is available to examine and treat a patient requiring immediate attention, the medical director shall have the authority to call another physician for appropriate treatment or treat the patient himself.

5. Prior to or upon admission of a patient, it would be desirable for the attending physician to perform a physical examination of his patient and provide the facility with an admitting diagnosis, statement of patient's functional status and orders for diet, medication and initial treatment. Other patient information required by the facility may be provided at the time of admission or as soon as practical thereafter and should include a family history, past medical history, report of current medical findings and a statement of rehabilitation potential and prognosis.

The physician should also make arrangements for furnishing the facility with appropriate laboratory, X-ray and consultation reports.

6. Each attending physician is responsible for planning the medical care of his patient. Upon admission of his patient, the physician should make a medical evaluation of his patient's immediate and long-term care needs. This should include information about medications, treatments, rehabilitative services, diets, precautions related to activities undertaken by the patient, and plans for continuing care and, when appropriate, discharge. In developing this plan, it may be necessary for the attending physician to consult with the patient and/or the patient's family. The attending physician should review this plan at least annually and make revisions when appropriate. The plan may be reviewed by the medical director so that he may ensure consistency with the facility's policies.

7. The facility should inform each attending physician of the

availability of social, psychological and other nonmedical aspects of care for his patient so that he may assure himself that such care is compatible with the medical condition of the patient.

8. The attending physician should be aware of the need for the medical director, in fulfilling his required duties, to review the records of patients in the facility and, on occasion, actually contact the patient and/or family.

9. It is desirable for the attending physician to consult with the medical director and/or administrator when, in the judgment of either, there is a question as to the appropriate placement or the advisability of transfer of any patient originally admitted by the attending physician.

10. Where possible, the physician should reserve the right to seek consultation. As part of the treatment plan, this should be discussed with the patient. The facility's administrative personnel, medical director and other involved personnel, should not independently request consultation without

Sound ideas for saving time and money

From pocket pagers to mobile phones, radio communication is a sound idea that will work for you, no matter where you work.

All size and manner of businesses and institutions can benefit from the correct use of electronic equipment.

At Mountainside, we supply virtually all types of quality communications at competitive prices. But we do more than that. We offer Comprehensive Consulting Services designed to determine the type of equipment that will work best for our clients.

Radio communication is not just for the other guy. Find out how our sound ideas can save you time and money. Call (301) 242-1900.

prior approval of the attending physician.

11. The attending physician should visit his patient on a schedule determined by the patient's medical needs, and which is consistent with any state or Federal regulations applicable, and this schedule should be documented in the patient's record. The attending physician may review his schedule of visits for each patient in conjunction with an annual reevaluation of the patient's health status.

12. During each visit, the attending physician should see his patient, sign all written changes in orders, and enter a progress note in the patient's record indicating that the patient has been visited. It should be the duty of the charge nurse to call the attention of the attending physician to orders requiring renewal. Except as specifically indicated below, treatment orders should not be permitted to expire without notification to the attending physician.

13. The attending physician should give all orders for treatment in writing. An order may be considered in writing if it is dictated to a licensed nurse, signed and dated by the nurse, and countersigned by the physician at the time of his next visit to the facility or by other acceptable arrangements.

14. The attending physician and the charge nurse should review the patient's medications and other treatment orders at the time of visits. If there are no changes in the orders, the physician need only write that the orders be continued; however, this privilege of a simple note may be limited by facility policy.

15. Patients should be discharged only on orders of the attending physician, except that in an emergency situation the medical director may order a transfer to a hospital. After discharge, the attending physician should furnish the necessary information on the transfer form, and should complete and sign the patient's records as soon as practical. If the patient is to be transferred, the attending physician may, except in an emergency,

furnish the necessary information on the transfer form.

16. The attending physician should recognize that all orders for narcotics, sedatives and hypnotics, anticoagulants and antibiotics will be automatically controlled by institution policy unless the order specifies the number of doses to be administered, and the duration of time is specified.

17. The attending physician should be aware that the pharmacist may review the drug regimen of each patient and report his comments to the medical director and administrator. In those instances where the medical director and the pharmacist question the appropriateness of the drug regimen, the question should be brought to the attention of the attending physician.

18. It would be desirable for each attending physician to prepare and maintain a complete medical record for each patient.

19. It would be desirable for each attending physician to participate in developing and maintaining an appropriate quality assurance program for the facility. Such participation may extend to medical care evaluation studies and periodic assessments and evaluation of patient care.

20. The attending physician should recognize that all records are the property of the facility and may not be removed without permission. In case of readmission of a patient, all previous records should be available for the use of the attending physician. This should apply whether the patient is attended by the same or by another physician.

21. The attending physician should have free access to all medical records of all patients in the facility for bona fide study and research, consistent with preserving the confidentiality of information concerning individual patients and physicians. Physicians formerly having patients in the facility should be permitted free access to information from the medical records of their patients covering all periods during which the physicians attended such patient.

23. The attending physician may attend an annual meeting if appropriate at which the medical director, the administrator and the committees functioning in the facility shall make appropriate reports. Each attending physician should have the opportunity to make recommendations concerning the facility's staff, services and resources. ☐

Booklet Available

The Faculty's booklet, **Laws, Rules and Regulations With Which Physicians Must Comply**, may be sent free of charge to physicians upon request, and also to others related to the health profession, such as nurses, psychologists, hospitals, HMOs, etc. For those individuals or organizations unrelated to the health profession, such as lawyers, corporations, etc., the charge is \$10 per copy, plus \$1 for postage and handling. Payment must be sent with request to Med-Chi, 1211 Cathedral St., Balto., MD 21201. ☐

Consultation: Physicians on Radio

A biweekly radio program called *Consultation* on WBJC-FM (91.5 mc) currently features physician speakers suggested by the Faculty Public Relations Committee. The program, which began Nov. 15, 1978, came as a result of a need to fill the 6:30 PM Wednesday time slot immediately following WBJC's award-winning *All Things Considered* program. The Faculty was contacted and the first programs began almost immediately. On alternate Wednesdays, speakers appear on behalf of the Maryland Bar Association. Both the Faculty and the Bar Association make a minimal financial contribution toward each program. Interest in the hour-and-a-half program, which features a call-in format, has been lively. The program host is John Stupak. The following is a list of possible programs and guests to be featured over the next several weeks:

Slipped Discs, Edward Layne, MD; *Arthritis*, Mary Betty Stevens, MD; *The Common Cold and Other Problems*, Timothy Herbert, MD and Edward Kowalewski, MD; *Hypertension/Blood Pressure*, Albert Antlitz, MD; *Fear of Dentistry*, Irving Hawkins, DDS and Morris Roseman, Ph.D; *Diets/Nutrician*, Maria Simonson, MD; *Adolescence*, Richard Sarles, MD; *Pain*, Donlin Long, MD; *Sports/Medicine*, Kenneth Spence, MD; *Shock Trauma Unit*, R Adams Cowley, MD; *Ulcers*,

MED-CHI RADIO SPEAKER DR. JOHN M. DENNIS

Vernon Smith, MD; *Alcoholism*, Maxwell Weisman, MD; *Artificial Joints*, David S. Hungerford, MD and *Medical Education*, Richard Ross, MD and John Dennis, MD. □

Rehabilitation Medicine

FREDERICK J. BALSAM, MD Editor

Rehabilitation of the Stroke Patient

By B. STANLEY COHEN, MD

•
Dr. Cohen is Chief of the Department of Rehabilitation Medicine at Sinai Hospital of Baltimore, and is also Professor of Rehabilitation Medicine at the University of Maryland School of Medicine. He can be contacted at Sinai Hospital for reprint and other data.

•
The ultimate goal of rehabilitation is the restoration of function. Ideally, the rehabilitated stroke patient should manifest mobility, independence in the performance of activities of daily living, satisfactory communication abilities and the capacity to return to family, recreational and vocational activities. The achievement of these goals will depend on a combination of factors, some inherent in the characteristics of the disease process, its nature, location and extent; some dependent on the premorbid personality, strengths and weaknesses of the person who has experienced the cerebral insult and many related to factors external to the patient. These latter include the support system within the family and community, as well as the promptness and adequacy of the treatment and rehabilitation programs. It is to this latter issue that the comments which follow are directed.

It is well-recognized at this time that the prognosis for ultimate function is related, in inverse fashion, to the time interval between the acute episode and the beginning of a restorative program. It has also been frequently demonstrated that in many instances failure to reach maximum function, and in some instances the ability to remain in the community, results as much from the dysmobility due to the complications of inadequate after-care as to the neurological deficit itself.¹

Examples of such complications are deconditioning, joint contractures, decubiti and peripheral nerve injuries, as well as psychological factors of depression, dependency and mental deterioration.

In all cases, planning for long-term management should begin concurrently with acute medical management. Skin care, with frequent turning to prevent

decubiti, proper positioning and support to prevent contractures and deformity, and careful handling to prevent joint subluxation and stretch or pressure neuropathies should begin at once. Prolonged positioning on the involved side may result in peripheral neuropathy. Traction on the paretic arm in moving and transferring the patient may result in brachial plexus injury or shoulder subluxation. Administration of intravenous fluids in the paralyzed arm may result in edema and restriction of joint motion.

Once the vital signs are stable and the patient is conscious, definitive rehabilitation measures should begin, in most cases within a day or two after onset. Careful neurologic and functional examination, of course, must precede the beginning of physical restoration. The deficits and the residual abilities are catalogued. The treatment plan is developed and short-term and long-term goals are established. These goals are reassessed at regular intervals. In most stroke patients, a team of many health disciplines is in order. The physician, nurse, physical therapist and occupational therapist are the most frequent team members. In most instances, the social worker and psychologist are also involved. Where speech and language problems manifest, the speech pathologist is a member of the team; later on, the vocational specialist may be appropriate.

Where significant visual field disturbance is present, the patient and bed should be positioned so that the uninvolved side faces away from the wall and toward the activity. Persons with homonymous hemianopsia who are placed in such manner that activity occurs on and they are regularly approached from, the "blind side," may become confused and agitated. The simple expedient of reorienting position may instantly correct an apparent dementia. In the case of the aphasic person, early efforts at establishing communication should be undertaken. In the absence of significant receptive aphasia, a communication board should be set up, using pictures or words as appropriate, so that the patient can indicate basic needs and feelings. Apparent incontinence can often be corrected by helping the aphasic to indicate the need for bed pan or urinal.

Physical restoration begins with positioning and performance of joint range of motion. The uninvolved side should receive exercise, both to prevent atrophy and weakness through disuse, and to develop the strength and coordination which will be required if, as in the majority of cases, full function is not regained in the involved extremities. If the patient is conscious and alert, he can be taught to carry the joints through the range of motion. If he cannot, the nurse and family can carry out these measures between therapy sessions. Sitting balance and sitting tolerance are established as soon as medically-feasible and transfer activities are begun. The patient is taught how to transfer with safety from bed to chair and from chair to toilet or commode. It is now well-established that less energy is consumed in use of a bedside commode than a bed pan. When sitting and standing, voluntary voiding is more easily-accomplished. External urinary collecting device may be used if frequency and urgency require them. Prolonged catheterization is rarely required.

Correction:

In the **Rehabilitation Medicine** section of the January, 1979 issue of the **Journal**, the name of **Frederick J. Balsam, MD**, as Editor of the **Rehabilitation Medicine Section** was inadvertently omitted from the logo. The **Journal** regrets the omission.

At the same time, the ability of the patient to perform or assist in activities of daily living (ADL) is assessed. These include toileting, bathing, grooming, dressing and feeding activities. One-handed activities, with the use of assistive devices, are taught. Where the dominant hand has been affected and prompt return of function has not occurred, change of dominance is taught.

Once adequate sitting balance is established and transfers can be accomplished, standing activities are begun. Frequently, parallel bars are used to provide stability with progression to ambulation with a walker or cane. The vast majority of stroke patients become ambulatory. In many, the short leg brace may be necessary to assist in clearing the foot and in stabilizing the ankle. Occasionally, a long leg brace is required for knee stabilization.

Exercises to restore function in the involved extremities are performed in stepwise fashion. Various techniques have been described and are preferred by different therapists in accordance with their training and experience. The critical issue is whether they can be integrated into functional activities. Prolonged performance of activities which can be accomplished only with the therapist and are not made part of daily activities within weeks or at most a few months is probably not justified. Stepwise progress, with an expectation of significant improvement, justifies continued therapy until a plateau in function is approached.

During the course of treatment, the pattern of psychological response is assessed and, with it, the need for intervention. Psychological denial is to be expected early in the course of the illness. Next, there is recognition of loss of function, mourning of the loss with a degree of reactive depression, and, then, adjustment to the disability and participation in the rehabilitation program in order to maximize function. The persistence of denial or the failure to deal with depression suggests the need for professional psychological support and therapy. In addition to psychological denial, there may be neurological denial. Particularly where there is substantial non-dominant hemisphere involvement, the patient may have major perceptual deficits and may deny the involved part to the extent of failure to bathe, shave, use makeup on, or dress the involved side. In severe cases, denial of the illness itself may result. Perceptual disorders may represent a significant impediment to therapy and require retraining. Visual-spatial deficits interfere with self-care and ambulation. The perception of verticality may be altered and require balance training in order to reorient the patient as to his position in space and the relative positions of his body parts.

There may be organic involvement of cognition, memory deficits, loss of abstract thinking and personality change. Where severe, these will interfere with physical rehabilitation and prevent vocational rehabilitation. Persons with mild to moderate involvement, however, can function satisfactorily and many can be trained for vocational activity.

The prognosis for functional activity is dependent

on age and medical factors. Frequently, prognosis is not dependent on motor return alone.²⁻³ Among the factors of importance in limiting function are severe sensory deficits, including visual, severe perceptual problems and the presence of such complications as contractures, often related to the length of time from onset to entry into the treatment program. The prognosis for return to vocational activity has been carefully studied and has been tied to various psychosocial and economic factors. For example, educational background, vocational attainment prior to illness and the presence or absence of disability compensation benefits have been found to be as important as the degree of residual muscle weakness in vocational success after stroke.⁴

Summary

In summary, it should be noted that the prognosis for physical recovery in survivors is better than previously believed. Early and adequate rehabilitation measures, with prevention of complications, will result in the ability to ambulate alone and ADL independence in 60-80%. An additional 10-25% can be expected to ambulate with assistance and perform activities of daily living with assistance. The ability to perform in competitive employment or in homemaking activities can be expected in 45-50%, with an additional 10-15% functioning in a sheltered work setting.

SERIOUS RUNNERS RUN ATHLETIC ATTIC

FOR SERIOUS RUNNERS.

Running is our life. Just as it is yours. We are serious runners. We are Marty Liquori, Greg Fredericks, Ken Schappert, Jeff Howser, Mel Pender, Steve Foster, and many more. In fact, the great majority of our stores are managed by accomplished athletes.

We founded Athletic Attic to provide top quality gear to serious runners like ourselves. And like yourself.

We've been to that breaking point. We've run those hundred mile weeks. So when we select a product for our shelves, we go about it very seriously. And we apply our experience thoroughly.

The result — Athletic Attic consistently has the best selection of running shoes and equipment available anywhere. So if you're serious about running at your best, come to Athletic Attic. We've got what you're looking for. Seriously.

THE MADRID RESTAURANTE

The Madrid's delectable Spanish and continental cuisine, served in the charming atmosphere of Old Spain, comes highly recommended by Gourmet Magazine and other fine-food publications. Owner and chef Pepe is proud to offer any of his specialties . . . filet of sole in grappe sauce, paella marinera, chicken cordon bleu, calf sweetbread Toledo-style, and steak flambé. Plenty of tasty desserts to choose from, including home-style Baked Alaska. Baltimore's only flamenco show starts at 9 PM on Fridays and Saturdays only. Lunch served Monday through Friday. Dinner is served seven days a week.

Librax®

Each capsule contains 5 mg
chlordiazepoxide HCl and 2.5 mg clidinium Br.

Please consult complete prescribing information, a summary of which follows:

Indications: Based on a review of this drug by the National Academy of Sciences—National Research Council and/or other information, FDA has classified the indications as follows:

"Possibly" effective: as adjunctive therapy in the treatment of peptic ulcer and in the treatment of the irritable bowel syndrome (irritable colon, spastic colon, mucous colitis) and acute enterocolitis.

Final classification of the less-than-effective indications requires further investigation.

Contraindications: Glaucoma; prostatic hypertrophy, benign bladder neck obstruction; hypersensitivity to chlordiazepoxide HCl and/or clidinium Br.

Warnings: Caution patients about possible combined effects with alcohol and other CNS depressants, and against hazardous occupations requiring complete mental alertness (e.g., operating machinery, driving). Physical and psychological dependence rarely reported on recommended doses, but use caution in administering Librium® (chlordiazepoxide HCl) to known addiction-prone individuals or those who might increase dosage; withdrawal symptoms (including convulsions) reported following discontinuation of the drug.

Usage in Pregnancy: Use of minor tranquilizers during first trimester should almost always be avoided because of increased risk of congenital malformations as suggested in several studies. Consider possibility of pregnancy when instituting therapy. Advise patients to discuss therapy if they intend to or do become pregnant.

As with all anticholinergics, inhibition of lactation may occur.

Precautions: In elderly and debilitated, limit dosage to smallest effective amount to preclude ataxia, oversedation, confusion (no more than 2 capsules/day initially; increase gradually as needed and tolerated). Though generally not recommended, if combination therapy with other psychotropics seems indicated, carefully consider pharmacology of agents, particularly potentiating drugs such as MAO inhibitors, phenothiazines. Observe usual precautions in presence of impaired renal or hepatic function. Paradoxical reactions reported in psychiatric patients. Employ usual precautions in treating anxiety states with evidence of impending depression; suicidal tendencies may be present and protective measures necessary. Variable effects on blood coagulation reported very rarely in patients receiving the drug and oral anticoagulants; causal relationship not established.

Adverse Reactions: No side effects or manifestations not seen with either compound alone reported with Librax. When chlordiazepoxide HCl is used alone, drowsiness, ataxia, confusion may occur, especially in elderly and debilitated; avoidable in most cases by proper dosage adjustment, but also occasionally observed at lower dosage ranges. Syncope reported in a few instances. Also encountered: isolated instances of skin eruptions, edema, minor menstrual irregularities, nausea and constipation, extrapyramidal symptoms, increased and decreased libido—all infrequent, generally controlled with dosage reduction; changes in EEG patterns may appear during and after treatment; blood dyscrasias (including agranulocytosis), jaundice, hepatic dysfunction reported occasionally with chlordiazepoxide HCl, making periodic blood counts and liver function tests advisable during protracted therapy. Adverse effects reported with Librax typical of anticholinergic agents, i.e., dryness of mouth, blurring of vision, urinary hesitancy, constipation. Constipation has occurred most often when Librax therapy is combined with other spasmolytics and/or low residue diets.

ROCHE

Roche Products Inc.
Manati, Puerto Rico 00701

In treating irritable bowel syndrome*
Enhance your therapeutic expectations
with

Librax[®]

Each capsule contains
5 mg chlordiazepoxide HCl
and 2.5 mg clidinium Br.

antianxiety/antispasmodic/antimotility

Librax is unique among G.I. medications in providing the specific antianxiety action of LIBRIUM[®] (chlordiazepoxide HCl) as well as the potent antispasmodic and antimotility actions of QUARZAN[®] (clidinium Br) for adjunctive therapy of irritable bowel syndrome.

Librax has been evaluated as possibly effective for this indication.
Please see brief summary of prescribing information on preceding page.

The evidence of experience

Since October 1974 when Motrin® (ibuprofen) was introduced in the United States, it has been used by more than 6,000,000 patients with rheumatoid arthritis* or osteoarthritis. Rarely has an ethical pharmaceutical product been prescribed for so many patients in so short a time. In addition, more than 450 studies presenting new data related to Motrin have been published.

The 6,000,000 patients already treated with Motrin is an objective measure of physicians' confidence in the ability of Motrin to relieve the pain and inflammation associated with rheumatoid arthritis and osteoarthritis.

So it is not surprising that in this short period Motrin has become the most frequently prescribed alternative to aspirin. Motrin relieves joint pain and inflammation as effectively as indomethacin or aspirin, but causes significantly fewer CNS and milder GI reactions.

However, gastrointestinal bleeding, sometimes severe, has been associated with Motrin, aspirin, indomethacin, and other nonsteroidal antiarthritic agents.

*The safety and effectiveness of Motrin have not been established in patients with Functional Class IV rheumatoid arthritis (incapacitated, largely or wholly bedridden, or confined to wheelchair; little or no self-care).

Motrin[®] 400 mg TABLETS ibuprofen, Upjohn

The confidence that comes from experience—
one more reason to prescribe Motrin.

Please turn page for a brief summary of prescribing information.

Upjohn

The Upjohn Company, Kalamazoo, Michigan 49001

J-6857-4

The confidence that comes from experience—
one more reason to prescribe

Motrin[®] 400 mg TABLETS

ibuprofen, Upjohn

Indications and Usage: Treatment of signs and symptoms of rheumatoid arthritis and osteoarthritis during acute flares and in long-term management. Safety and efficacy have not been established in Functional Class IV rheumatoid arthritis.

Contraindications: Individuals hypersensitive to it, or with the syndrome of nasal polyps, angioedema and bronchospastic reactivity to aspirin or other nonsteroidal anti-inflammatory agents (see WARNINGS).

Warnings: Anaphylactoid reactions have occurred in patients with aspirin hypersensitivity (see CONTRAINDICATIONS).

Peptic ulceration and gastrointestinal bleeding, sometimes severe, have been reported. Ulceration, perforation, and bleeding may end fatally. An association has not been established. Motrin should be given under close supervision to patients with a history of upper gastrointestinal tract disease, only after consulting ADVERSE REACTIONS.

In patients with active peptic ulcer and active rheumatoid arthritis, nonulcerogenic drugs, such as gold, should be tried. If Motrin must be given, the patient should be under close supervision for signs of ulcer perforation or gastrointestinal bleeding.

Precautions: Blurred and/or diminished vision, scotomata, and/or changes in color vision have been reported. If these develop, discontinue Motrin and the patient should have an ophthalmologic examination, including central visual fields.

Fluid retention and edema have been associated with Motrin; use with caution in patients with a history of cardiac decompensation.

Motrin can inhibit platelet aggregation and prolong bleeding time. Use with caution in persons with intrinsic coagulation defects and those on anticoagulant therapy.

Patients should report signs or symptoms of gastrointestinal ulceration or bleeding, blurred vision or other eye symptoms, skin rash, weight gain, or edema.

To avoid exacerbation of disease or adrenal insufficiency, patients on prolonged corticosteroid therapy should have therapy tapered slowly when Motrin is added.

Drug interactions. Aspirin used concomitantly may decrease Motrin blood levels.

Coumarin: Bleeding has been reported in patients taking Motrin and coumarin.

Pregnancy and nursing mothers: Motrin should not be taken during pregnancy or by nursing mothers.

Adverse Reactions

Incidence greater than 1%

Gastrointestinal: The most frequent type of adverse reaction occurring with Motrin (ibuprofen) is gastrointestinal (4% to 16%). This includes nausea*, epigastric pain*, heartburn*, diarrhea, abdominal distress, nausea and vomiting, indigestion, constipation, abdominal cramps or pain, fullness of the GI tract (bloating and flatulence). **Central Nervous System:** Dizziness*, headache, nervousness. **Dermatologic:** Rash* (including maculopapular type), pruritus. **Special Senses:** Tinnitus. **Metabolic:** Decreased appetite, edema, fluid retention. Fluid retention generally responds promptly to drug discontinuation (see PRECAUTIONS).

Incidence: Unmarked 1% to 3%; *3% to 9%.

Incidence less than 1 in 100

Gastrointestinal: Upper GI ulcer with bleeding and/or perforation, hemorrhage, melena.

Central Nervous System: Depression, insomnia. **Dermatologic:** Vesiculobullous eruptions, urticaria, erythema multiforme. **Cardiovascular:** Congestive heart failure in patients with marginal cardiac function, elevated blood pressure. **Special Senses:** Amblyopia (see PRECAUTIONS). **Hematologic:** Leukopenia, decreased hemoglobin and hematocrit.

Causal relationship unknown

Gastrointestinal: Hepatitis, jaundice, abnormal liver function. **Central Nervous System:** Paresthesias, hallucinations, dream abnormalities. **Dermatologic:** Alopecia, Stevens-Johnson syndrome. **Special Senses:** Conjunctivitis, diplopia, optic neuritis. **Hematologic:** Hemolytic anemia, thrombocytopenia, granulocytopenia, bleeding episodes. **Allergic:** Fever, serum sickness, lupus erythematosus syndrome. **Endocrine:** Gynecomastia, hypoglycemia. **Cardiovascular:** Arrhythmias. **Renal:** Decreased creatinine clearance, polyuria, azotemia.

Overdosage: In cases of acute overdosage, the stomach should be emptied. The drug is acidic and excreted in the urine, so alkaline diuresis may be beneficial.

Dosage and Administration: Suggested dosage is 300 or 400 mg t.i.d. or q.i.d. Do not exceed 2400 mg per day.

NIM-3

Librium®

chlordiazepoxide HCl/Roche

- ☐ Proven antianxiety performance
- ☐ An unsurpassed safety record
- ☐ Predictable patient response
- ☐ Minimal effect on mental acuity at recommended doses
- ☐ Minimal interference with many primary medications, such as antacids, anticholinergics, diuretics, cardiac glycosides and antihypertensive agents

Before prescribing, please consult complete product information, a summary of which follows:

Indications: Relief of anxiety and tension occurring alone or accompanying various disease states. Efficacy beyond four months not established by systematic clinical studies. Periodic reassessment of therapy recommended.

Contraindications: Patients with known hypersensitivity to the drug.

Warnings: Warn patients that mental and/or physical abilities required for tasks such as driving or operating machinery may be impaired, as may be mental alertness in children, and that concomitant use with alcohol or CNS depressants may have an additive effect. Though physical and psychological dependence have rarely been reported on recommended doses, use caution in administering to addiction-prone individuals or those who might increase dosage; withdrawal symptoms (including convulsions), following discontinuation of the drug and similar to those seen with barbiturates, have been reported.

Usage in Pregnancy: Use of minor tranquilizers during first trimester should almost always be avoided because of increased risk of congenital malformations as suggested in several studies. Consider possibility of pregnancy when instituting therapy; advise patients to discuss pregnancy if they intend to or do become pregnant.

Precautions: In the elderly and debilitated, and in children over six, limit to smallest effective dosage (initially 10 mg or less per day) to preclude ataxia or oversedation, increasing gradually as needed and tolerated. Not recommended in children under six. Though generally not recommended, if combination therapy with other psychotropics seems indicated, carefully consider individual pharmacologic effects, particularly in use of potentiating drugs such as MAO inhibitors and phenothiazines. Observe usual precautions in presence of impaired renal or hepatic function. Paradoxical reactions (e.g., excitement, stimulation and

acute rage) have been reported in psychiatric patients and hyperactive aggressive children. Employ usual precautions in treatment of anxiety states with evidence of impending depression; suicidal tendencies may be present and protective measures necessary. Variable effects on blood coagulation have been reported very rarely in patients receiving the drug and oral anticoagulants; causal relationship has not been established clinically.

Adverse Reactions: Drowsiness, ataxia and confusion may occur, especially in the elderly and debilitated. These are reversible in most instances by proper dosage adjustment, but are also occasionally observed at the lower dosage ranges. In a few instances syncope has been reported. Also encountered are isolated instances of skin eruptions, edema, minor menstrual irregularities, nausea and constipation, extrapyramidal symptoms, increased and decreased libido—all infrequent and generally controlled with dosage reduction; changes in EEG patterns (low-voltage fast activity) may appear during and after treatment; blood dyscrasias (including agranulocytosis), jaundice and hepatic dysfunction have been reported occasionally, making periodic blood counts and liver function tests advisable during protracted therapy.

Usual Daily Dosage: Individualize for maximum beneficial effects. Oral—Adults: Mild and moderate anxiety and tension, 5 or 10 mg t.i.d. or q.i.d.; severe states, 20 or 25 mg t.i.d. or q.i.d. Geriatric patients: 5 mg b.i.d. to q.i.d. (See Precautions.)

Supplied: Librium® (chlordiazepoxide HCl) Capsules, 5 mg, 10 mg and 25 mg—bottles of 100 and 500; Tel-E-Dose® packages of 100, available in trays of 4 reverse-numbered boxes of 25, and in boxes containing 10 strips of 10; Prescription Paks of 50, available singly and in trays of 10. Libritabs® (chlordiazepoxide) Tablets, 5 mg, 10 mg and 25 mg—bottles of 100 and 500. With respect to clinical activity, capsules and tablets are indistinguishable.

A full range of treatment...

As an Air Force physician, you may practice your specialty in modern, well-equipped facilities with a complete support staff.

In addition to the wide spectrum of clinical experience you'll gain, you'll have administrative support to alleviate most of the clerical workload. The type of medicine you will practice is based on the needs of your patients, regardless of their financial status.

For yourself and your family, Air Force medicine will provide reasonable working hours, excellent pay, 30 days of paid vacation each year, and many other benefits.

Consider the Air Force Medical Corps – a reasonable alternative for today's physicians.

Air Force. A great way of life.

Don't drive by Charles and 24th without stopping to see the extraordinary 1979 Eldorado.

Chesapeake Cadillac invites you to see and drive a new breed of Eldorado. A triumph of advanced engineering and traditional Cadillac quality with an unprecedented combination of features that make Eldorado for 1979 unique in the luxury car field.

Front-wheel drive for sure traction and increased interior room. Four-wheel independent suspension for an incredibly smooth ride. Electronic fuel injection for quick

response and smooth performance. Front-wheel disc brakes for rapid heat dissipation and superb braking efficiency. Electronic level control that adjusts to changing loads automatically. Side window defoggers. All standard on the '79 Eldorado.

And, there's one more thing that's standard. Not on all Cadillacs, but on every Cadillac from Chesapeake. Chesapeake Priority Service.

Because we believe if you own a Cadillac, you ought to be treated like a Cadillac owner.

And you'll be surprised at how easy it is to be a Cadillac owner at Chesapeake.

You see, Chesapeake can afford to sell for less. Because we've been selling and servicing Cadillacs, and only Cadillacs,

for over half a century. And, we sell more than anyone else. There's got to be a reason.

Chesapeake Cadillac

Competitive prices with service that has no competition.

LEDERLE Tuberculin, Old

TINE TEST®

An important check in every checkup.

A system, not just a test — supplied with patented induration indicator cards in English or Spanish — simplifies recording and record keeping.

- Over 15 years of use — millions of tests performed each year.
- Practical and easy to perform — presterilized; disposable; no refrigeration needed; no needles or syringes.
- Fast — only seconds to perform — can be read in 48-72 hours.

Precautions: Tuberculin testing should be done with caution in persons with active tuberculosis. However, activation of quiescent lesions is rare.

Although clinical allergy to acacia is very rare, this product contains some acacia as a stabilizer and should be used with caution in patients with known allergy to this component. Reactivity to the test may be suppressed in patients who are receiving corticosteroids or immunosuppressive agents, or those who have recently been vaccinated with live virus vaccine such as measles.

With a positive reaction, further diagnostic procedures must be considered. These may include x-ray of the chest, microbiologic examinations of sputa and other

specimens, and confirmation of the positive TINE TEST using the Mantoux method. In general, the TINE TEST does not need to be repeated. Antituberculous chemotherapy should not be instituted solely on the basis of a single positive TINE TEST.

Adverse Reactions: Vesiculation, ulceration, or necrosis may occur at the test site in highly sensitive persons. Pain, pruritus and discomfort at the test site may be relieved by cold packs or by a topical glucocorticoid ointment or cream. Transient bleeding may be observed at a puncture site and is of no significance.

to relieve psychic tension
and its functional symptoms

VALIUM®

(diazepam) 

2-mg, 5-mg, 10-mg scored tablets

VALIUM® (diazepam)

Before prescribing, please consult complete product information, a summary of which follows:

Indications: Tension and anxiety states, somatic complaints which are concomitants of emotional factors; psychoneurotic states manifested by tension, anxiety, apprehension, fatigue, depressive symptoms or agitation; symptomatic relief of acute agitation, tremor, delirium tremens and hallucinosis due to acute alcohol withdrawal, adjunctively in skeletal muscle spasm due to reflex spasm to local pathology, spasticity caused by upper motor neuron disorders, athetosis, stiff-man syndrome, convulsive disorders (not for sole therapy).

The effectiveness of Valium in long-term use, that is, more than 4 months, has not been assessed by systematic clinical studies. The physician should periodically reassess the usefulness of the drug for the indi-

Contraindicated: Known hypersensitivity to the drug. Children under 6 months of age. Acute narrow angle glaucoma. May be used in patients with open angle glaucoma who are receiving appropriate therapy.

Warnings: Not of value in psychotic patients. Caution against hazardous occupations requiring complete mental alertness. When used adjunctively in convulsive disorders, possibility of increase in frequency and/or severity of grand mal seizures may require increased dosage of standard anticonvulsant medication. Abrupt withdrawal may be associated with temporary increase in frequency and/or severity of seizures. Advise against simultaneous ingestion of alcohol and other CNS depressants. Withdrawal symptoms (similar to those with barbiturates and alcohol) have occurred following abrupt discontinuance (contraindication, tremor, abdominal and muscle cramps, vomiting and sweating). Keep addiction-prone individuals under careful surveillance because of their predisposi-

Usage in Pregnancy: Use of minor tranquilizers during first trimester should almost always be avoided because of increased risk of congenital malformations as suggested in several studies. Consider possibility of pregnancy when instituting therapy; advise patients to discuss therapy if they intend to or do become pregnant.

Precautions: If combined with other psychotropics or anticonvulsants, consider carefully pharmacology of agents employed. Drugs such as phenothiazines, narcotics, barbiturates, MAO inhibitors and other anxiolytics may potentiate its action. Usual precautions indicated in patients severely depressed, or with latent depression, or with suicidal tendencies. Observe usual precautions in impaired renal or hepatic function. Limit dosage to smallest effective amount in elderly and debilitated to preclude ataxia or oversedation.

hypotension, changes in libido, nausea, fatigue, depression, dysarthria, jaundice, skin rash, ataxia, constipation, headache, incontinence, changes in salivation, slurred speech, tremor, vertigo, urinary retention, blurred vision. Paradoxical reactions such as acute hyperexcited states, anxiety, hallucinations, increased muscle spasticity, insomnia, rage, sleep disturbances, stimulation have been reported; should these occur, discontinue drug. Isolated reports of neutropenia, jaundice, periodic blood counts and liver function tests advisable during long-term therapy.

THE FURNITURE PEOPLE

May 1, 1979

Dear Medical Professionals:

We've planned a Special Week at Shaivitz Furniture just for you and your families.

Be our guests at any one of our three showcase stores - -

SHAIVITZ WEST, 6415 Baltimore National Pike
Beltway Exit 15 West

SHAIVITZ NORTH, Eudowood Plaza, Beltway Exit 28
East Joppa Road near Goucher Blvd.

SHAIVITZ SOUTH, Arnold Road and Ritchie Highway

Join us on one of the following dates:

Wednesday, May 23 from 5 p.m. - 9 p.m.
Thursday, May 24 from 5 p.m. - 9 p.m.
Friday, May 25 from 5 p.m. - 9 p.m.
Saturday, May 26 from 9 a.m. - 8 p.m.

Come in and chat with our professional design staff. Enjoy some wine and cheese. Browse through the largest and most innovative displays of home fashion in the area. And, ask about the unique ways we can make your office interiors work and look the best.

Just for coming by, we have some gifts for you. A merchandise certificate worth up to \$50 to save you even more on our Anniversary Sale priced furniture. The Sale that's brimming with special prices reduced as much as 40%! And, you'll receive a beautiful tropical plant you can take home with you when you visit us (only one certificate and plant per family). Simply present this letter at the door for your certificate and plant.

Please don't forget the dates. All of us at SHAIVITZ, THE FURNITURE PEOPLE, are looking forward to greeting you!

Sincerely yours,

SHAIVITZ, THE FURNITURE PEOPLE

Bernard Shaivitz
Vice President

P.S. You are welcome to use this certificate up to 4 months after date of issue.

"Competent Historical Research . . ." Was Prince Eddy Dyslexic?

To the Editor:

Blaine Taylor's lucid account of the life of "Prince Eddy," alias Jack the Ripper (*Health in History: Was Jack the Ripper Heir to the British Throne? A New Book Says "Yes!"*—February, 1979—ed. note) is a well-documented example of competent historical research.

Nevertheless, what still remains to be resolved is the nature of the Prince's severe mental retardation. He was said to be, "The dimmest of all the children," was "Incapable of learning," was considered to be "Extraordinarily backward" and was described, as behaving as if, "He had a weakness of the brain;" however, despite his alleged imbecility, the Prince was said to be "a pleasing young fellow," who was "natural and unstuck-up," "extremely polite in his manner," as well as being "modest, equable and deferential to his elders," particularly to his grandmother, Queen Victoria, who "regarded him with affection."

Furthermore, the Prince became "moderately efficient" while in military service, took "great interest in his uniform" and "dressed himself with utmost care." Indeed, he was reported as being "almost smart to the

point of dandyism" and was nicknamed "Collar and Cuffs." Prince Eddy also was a notorious womanizer, which appears to be at odds with his "backwardness."

There is the possibility that his boredom and early deviate behavior may have been due to a specific reading disability (dyslexia), which would have made it impossible for him to learn to read and, therefore, he could be thought of as being severely-mentally retarded by his teachers and family.

Dyslexia occurs six times as often in boys as in girls, and usually there is a family history of slowness in learning to read. The existence of poorly-established handedness in these cases would indicate that there exists a disturbance in the normal development of the brain, with a resulting right-left disorientation in space. These children cannot read consistently from left to right, and require special remedial reading. Many dyslexic children frequently respond to being called "stupid" by their peers and family with socially-deviate behavior.

The possibility that the Prince may have had dyslexia is not being offered as even being a partial explanation of his Jack the Ripper activities. From a psychiatric point of view, the diagnoses of syphilis and homosexuality also cannot be used to "explain" a compulsion to disembowel women.

Prince Eddy's case is rare in the annals of crime.

Guttmacher has stated, that "Pure sadistic homicides, the so-called lust murders, are fortunately rare." Those who commit this type of murder are "mostly sexually impotent, and nearly all are psychotic—without exception." Homocidal, psychotic murderers also have been treated cruelly in early life, "have formed a lasting, blighting identification with brutal parents" and "have learned that violence was a solution to frustration." (Reference: M. Guttmacher, *The Mind of the Murderer*, NY, Grove Press Inc., 1962, p. 95-96.)

It may be worthwhile to try to establish the diagnosis of dyslexia in the case of Prince Eddy, as it would help to explain his alleged, apparent, mentally-defective behavior.

Concerning Timoptic . . .

To the Editor:

I want to mention to your readers the possible systemic complications with the use of the new anti-glaucoma eyedrop—TIMOPTIC (Timolol, Merck, Sharp and Dohme).

This medication has become available for general ophthalmic use since November, 1978, and because it does not have the usual side-effects of the standard glaucoma drops, it is likely to be very widely-prescribed by ophthalmologists. I began working with the drug some two years ago during a glaucoma fellowship, and so have had more time to see or learn of significant systemic and local reactions. These adverse reactions are referred to in the package insert, but the patient's general physician is perhaps not likely to be familiar with this ophthalmic drug.

Timoptic is a beta-adrenergic blocking agent and there is significant systemic absorption when it is used in the eye in the recommended dosage. Patients with asthma can have their condition worsened or have an acute attack precipitated by the use of Timoptic. Furthermore, patients can experience marked bradycardia and a fall in blood pressure. Although these complications are uncommon, I did want to remind my colleagues that they can occur.

Hopkins Hospital Director Testifies Against Administration's Cost Containment Bill

The Director of the Johns Hopkins Hospital testified against the Administration's hospital cost containment bill recently. **Robert M. Heyssel, MD**, who is also President of the Council of Teaching Hospitals, told the US House Ways and Means Subcommittee on Health that Hopkins' record in containing costs would have been hampered by provisions like those in the new bill.

Particularly critical of the wage increase pass-through for non-supervisory employees allowed in the bill, Dr. Heyssel told the Subcommittee costs will be impossible to control if non-supervisory workers feel a hospital can increase wages with no real penalty. "In a labor-intensive industry, if you exempt salaries, you won't control anything," he stressed.

During the last fiscal year, the Hopkins Hospital inflation rate per admission was 8.2%, Dr. Heyssel said. Hopkins, however, was operating under the regulations of the Maryland Health Services Cost Review Commission (HSCRC), which does not allow a wage pass-through. Hopkins non-supervisory workers, therefore, realized that they had to accept a new contract within the Commission's 7% allowable increase for inflation, he said.

Dr. Heyssel contradicted prior Administration testimony that non-supervisory workers in hospitals are paid less than persons in similar positions in industry. Data developed by the Maryland HSCRC shows this is no longer true, he said. In fact, the HSCRC found that hospitals in Baltimore were paying many of its non-supervisory workers more than they would earn in industry doing comparable jobs. For instance, unskilled and clerical workers were paid, on the average, 18.4% above those in industry in similar job classifications.

According to Dr. Heyssel, the 1% increase allowed by the Administration for service and program improvements would drastically curb new technology.

"Since 1950, Social Security Administration analysis has repeatedly shown that approximately one-half of the increase in hospital costs has been a result of improvements in hospital services," Dr. Heyssel noted. "I don't believe the American public wishes dramatically to curtail improvements in hospital service," he stressed.

Dr. Heyssel emphasized that Johns Hopkins could not have opened its new Comprehensive Cancer Center in 1977 if the HSCRC had not allowed Hopkins temporarily to exclude the Center's costs from the Hospital's total inflation rate. The Administration's proposal would "close the system and freeze us and the public where we are now in the treatment of disease," Dr. Heyssel declared.

Dr. Heyssel offered to the Subcommittee some of his own recommendations for curbing hospital costs. These include:

- Fully implementing the PSRO and health planning mechanisms; extending PSROs to all patients regardless of payer, and requiring community physicians to comply with the same regulations for new facilities and equipment as are applied to hospitals.

- Allowing Medicare and Medicaid to pay State-determined rates.

- Requiring cost impact statements for regulations and legislation affecting hospitals.

- Recognizing that comparative, prospectively-determined rates are a legitimate way of containing costs.

- Allowing the true voluntary effort of American hospitals to continue.

"No one should be deceived into believing that the Administration's bill combines a voluntary cost con-

tainment program with a mandatory program," Dr. Heyssel said. "Both cost containment sections are mandatory, because the Secretary sets the limits on each. There is a truly voluntary program that is working now, and that program should continue."

The Council of Teaching Hospitals, which Dr. Heyssel heads, represents over 400 major teaching hospitals. These hospitals provide the most complex tertiary services and are responsible for a majority of the nation's graduate medical education programs. □

Dr. Robert Austrian Gives Hopkins' Thayer Lecture

Dr. Robert Austrian, Chairman of the Department of Research Medicine at the University of Pennsylvania and co-winner of the 1978 Albert Lasker Clinical Research Award, presented this year's Thayer Lecture at the Johns Hopkins School of Medicine. He recently discussed "The Pneumococcus at Hopkins: Early Portents of Future Developments."

Dr. Austrian was awarded the Lasker prize for developing a vaccine that could prevent three-quarters of the nation's estimated 750,000 annual cases of pneumococcal pneumonia.

A 1941 graduate of the Johns Hopkins School of Medicine, Dr. Austrian began his research with pneumococci while on the Hopkins faculty, where he was an instructor in medicine from 1942-52. A native Baltimorean, he also received his BA from Hopkins and was a university trustee for six years. Dr. Austrian's father, **Dr. Charles Austrian**, was a distinguished Hopkins physician. His mother, Florence H. Austrian, is a noted Baltimore artist.

In 1970, Dr. Austrian received the Distinguished Alumni Award and, last year, was chosen for membership in the Johns Hopkins University Society of Scholars.

The Thayer Lectureship was endowed in the memory of Dr. William Sidney Thayer, a former professor of medicine at Hopkins, and his wife, Susan Read Thayer. The lecturers are scholars distinguished in clinical medicine, pediatrics, neurology or related disciplines. □

Your Medical Faculty At Work

JOHN SARGEANT, CAE, Executive Director

Executive Committee

The Executive Committee met on March 29, 1979 and took the following actions:

1. Approved a contribution of \$300 towards costs of presenting a mock health claims arbitration panel on Thursday, June 7, 1979, from 7 PM to 10 PM at the University of Maryland School of Medicine.
2. Approved a contribution of \$500 towards the cost of transportation of a visiting mainland China physician who would be in the area early in May, 1979. This will be a cosponsorship of a meeting with the Baltimore City Medical Society, at which a scientific program will be presented.
3. Authorized expenditure of up to \$1,500 for the cost of honoraria for speakers at the 1979 Semiannual Scientific meeting being held in New Orleans, LA.
4. Authorized the immediate Past President to serve in an official liaison capacity with the Maryland Hospital Association.
5. Provided the Maryland Scholarship Board with a list of family physicians, three of whom will be selected to serve as an advisory group in connection with the Family Practice/Residency and Family Practice Medical School scholarships.
6. Designated Edmond J. McDonnell, MD of Baltimore to be reappointed to the Advisory Council on Hospital Licensing. □

Council

The Council met on March 29, 1979 and took the following actions:

1. Approved recommendations to the House of Delegates for various members, all on the request of the Component Society concerned.
2. Waived 1979 dues for various members on account of illness, all at the request of component societies involved.
3. Approved the following resolution, at the request of the Faculty Committee on Continuing Medical Education:

"Whereas, Standards for accreditation of Continuing Medical Education in Maryland were the result of an agreement between the American Medical Association and the Medical and Chirurgical Faculty of the State of Maryland in 1972 and

Whereas, The Committee on Continuing Medical

Education of the Medical and Chirurgical Faculty of the State of Maryland was the recognized body delegated the responsibility of overseeing continuing medical education activities in the State of Maryland and

Whereas, This aforementioned Committee continues to function as the only organization in Maryland delegated the authority to review institutions and organizations in order to ascertain their qualifications for accreditation for continuing medical education and

Whereas, This same Committee gives consultation and guidance to organizations and institutions in the state who have applied for accreditation as well as those already accredited and

Whereas, An intolerable delay in the accreditation process has occurred since this authority passed from the American Medical Association to the Liaison Committee on Continuing Medical Education (LCCME) and

Whereas, The Liaison Committee on Continuing Medical Education has drawn nationwide criticism for failing to keep the state Continuing Medical Education Committee currently well-informed and

Whereas, Many state Continuing Medical Education committees have joined, out of frustration and/or concern, the National Council of State Committees on Continuing Medical Education and

Whereas, the Maryland State Board of Medical Examiners does not recognize the AMA's Physician's Recognition Award as a valid instrument for the purpose of reregistration of license to practice medicine in the state of Maryland therefore be it

RESOLVED, That the Medical and Chirurgical Faculty of the State of Maryland reaffirm the concept of accreditation of Continuing Medical Education by those state medical associations whose standards for Continuing Medical Education are in agreement with those established by the AMA and the Liaison Committee on Continuing Medical Education and be it further

RESOLVED, That the Medical and Chirurgical Faculty of the State of Maryland instruct its delegates to the AMA to support the principle that the LCCME permit those state medical associations whose standards are in agreement with the AMA and the LCCME to once again accredit institutions and organizations within their jurisdiction for Continuing Medical Education and be it further

RESOLVED, That failing such an agreement, the Medical and Chirurgical Faculty of the State of Maryland cease recognition of the LCCME as accrediting authority for Continuing Medical Education in the state of Maryland and concern itself with the Continuing Medical Education needs of the physicians of the state as mandated by the Maryland State Board of Medical Examiners and be it further

RESOLVED, That a copy of this resolution be sent to the CME Committee of each state, district and territory with the recommendation that they consider and support similar action in their state".

4. Declined to appropriate \$5,000 for assistance to medical students in underwriting continuing study during summer months in a clinical situation. Suggested that funds for this be taken from the contributions made through Faculty members on an annual basis to both medical schools, which are unrestricted in their use.

5. Declined to participate to the extent of \$9,000 in a proposed study dealing with primary care services rendered by physicians in Baltimore City. Indicated that this would establish a dangerous precedent and require the Faculty to contribute to similar studies by other components, and also indicated its feeling that this was properly a funding responsibility of the Federal or State government, inasmuch as this data is needed by the HSAs.

6. Heard that the case of Hartsock vs. the Faculty has been dismissed by the Court.

7. Endorsed project **Survival Guide**, which is to be published as part of the Baltimore City yellow pages of the telephone directory, after learning that content had been approved and recommendation made in this regard by the Faculty's Committee on Medical Emergency Services.

8. Approved Williamsburg, VA, as the site for the 1980 Semiannual Meeting, for the dates of Thursday, Sept. 11 through Sunday, Sept. 14, with the understanding that the House of Delegates sessions will be held in Baltimore. ☐

"Harmless" Microorganisms Endanger Growing Number of Patients

A disease whose only known major outbreak before 1960 was among malnourished infants in Europe after World War II has replaced polio, scarlet fever, pertussis and diphtheria as a prominent concern of infectious disease specialists at the John Hopkins Children's Center. A form of pneumonia first reported in the United States in

1956, the disease is caused by a microorganism, *Pneumocystis carinii*, that infects without symptoms 70% of healthy children by four years of age, but causes illness only in those whose immune systems are suppressed by drugs or disease.

Ironically, the same medical techniques that have enabled more cancer patients, premature infants and organ transplant recipients to survive have increased the number of patients unable to resist normally "harmless" microorganisms such as

P. carinii, says Walter T. Hughes, MD, Director of the Division of Pediatric Infectious Diseases at Hopkins.

"It is likely that within the next few years we will see more patients with *P. carinii* pneumonia than with the so-called common childhood infections of measles, rubella and mumps," he predicts.

Control of *Pneumocystis pneumonia* is hampered by a lack of basic knowledge about the microorganism *P. carinii*. It is so poorly understood that microbiologists still aren't sure whether it is a protozoan or a fungus, and they can only guess at its mode of transmission point of entry into a person's system and natural habitat.

Another problem is diagnosis. Although doctors have found that the otherwise fatal disease can be effectively treated and prevented with the drug compound trimethoprim-sulfamethoxazole, they cannot easily confirm diagnosis without surgically removing a portion of a patient's lung for study.

Hopkins scientists are pursuing some promising leads, however. They know that many mammals from all continents, including cattle, sheep, goats, foxes, monkeys, swine, dogs, cats, rats and mice carry *P. carinii*. This knowledge has led to the development of an animal model to study the disease: all rats given drugs which suppress the immune system, such as those used to prevent rejection of transplanted organs, eventually become infected with *Pneumocystis pneumonia*, and most die. The knowledge that many pets probably carry *P. carinii* has suggested another area of study, the possibility of animal-to-man transmission.

An investigation of the link to protein-calorie malnutrition has also yielded useful information. Among a group of South African children with a form of malnutrition called Kwashiorkor disease, Dr. Hughes found that 7% became ill with *Pneumocystis pneumonia*—about the same prevalence as in patients whose immune system are

suppressed by drugs. This finding suggested that the malnutrition many cancer patients suffer, due to a lack of appetite, could make them more susceptible to infection.

Hopkins scientists are also hopeful that new laboratory techniques to identify the organism in the test tube will provide them with safer, faster and cheaper ways to diagnose *P. carinii* and other infectious diseases.

"While sophisticated medical technology has helped prolong the lives of patients with previously untreatable diseases, it has brought with it new problems, such as enabling formerly 'harmless' microorganisms to become virulent, but we are hopeful that this same technology will also be the means for their control," says Dr. Hughes.

"Combatting these new diseases will be one of the major challenges in coming years to infectious disease specialists in this country." □

Montgomery County Medical Society Presents Awards

The Montgomery County Medical Society recently gave awards to six citizens for their contributions to the health care of the community. The awards, in the form of certificates, were presented at the Medical Society's General Membership Meeting held at Indian Spring Country Club.

The awards were given to State Senator Margaret Schweinhaut for her long-standing interest in health care, particularly in aid of the elderly and the handicapped, during her 24 years in the State Legislature; to County Executive James P. Gleason for his efforts in the development of the Montgomery County Medical Center, drug abuse programs, a community crisis center and meeting health needs of the elderly, handicapped and youth with alcohol problems; to Mrs. Elizabeth L. Scull, County Council President, for her work with developing enabling County legislation to establish the Health Systems Agency, anti-smoking laws in public places and as Council member since 1970, many other health issues; to Herman A. Meyersburg, MD and George J. Cohen, MD for

Executive Director's Newsletter

May, 1979

PHYSICIAN FROM
CHINA TO ADDRESS
MEETING

A special joint meeting of the Faculty and Baltimore City Medical Society is scheduled for Sunday, May 13, 1979, when Huang Chia-ssu, MD, will be the guest speaker. The session will be held at 7:30 PM at the Cross Keys Inn, Baltimore, in the White Oak Ballroom. Dr. Huang will address the guests on current medical education in China.

LEGISLATURE
ENDS

The General Assembly adjourned on Monday, April 9, at midnight, until the 1980 General Assembly convenes. During the summer months, innumerable studies will take place in areas of health and health-related services.

A complete listing of all bills introduced and the final disposition of them is available from the Faculty office.

NOTE: This will be mailed upon request from the Faculty office.

Despite efforts by the Faculty, a bill was enacted that would permit physical therapists to see patients directly and without referral from a physician. The Mental Hygiene laws were amended so that rather than only two physicians certifying patients for admission to mental institutions, it can be either two physicians or a clinical psychologist and a physician.

Heavy efforts by the Faculty and the Ophthalmologists resulted in defeat of a bill permitting Optometrists to use diagnostic medications. This was not accomplished without whole-hearted cooperation of all groups involved. The final vote was 15-7 in the House Environmental Matters Committee. The Senate Economics Affairs Committee voted approval of the bill to the Senate by a vote of 5-4. Copies of the voting list are available upon request.

A measure to include physicians' offices in the Certificate of Need program was defeated with the Faculty being the only group in opposition. Supporters of this measure included the State Health Planning Agency, Maryland Blue Cross, Maryland Hospital Association, Health Insurance Association of America and others.

A measure to place at least one consumer on health licensing boards within the Department of Health and Mental Hygiene was sent for summer study. Again, the Faculty was the only group appearing in opposition to this measure. As written, the Board of Medical Examiners would have been increased by the addition of two consumers, as would the Commission on Medical Discipline.

OTHER
LEGISLATIVE
MEASURES

A bill requiring hospitals to amend their bylaws to include privileges for Podiatrists was enacted. Another podiatry bill was enacted changing the definition to include the amputation of a toe or toes.

A bill that would have extended the number of terms a member could serve on the Health Services Cost Review Commission also passed the House but was retained in the Senate Finance Committee.

Maryland will become the first state where physicians and dentists will be required to identify themselves as specialists only through approval of the separate licensing agencies. Similar in nature, these laws will prohibit the advertising or "holding...out as a specialist" of either of these professions without prior approval of the Board. The acts take effect July 1, 1980. NOTE: This is IDENTIFICATION, not Certification.

MOCK
HEALTH CLAIMS

A mock Health Claims Arbitration Panel will be presented on Thursday, June 7, 1979, at the University of Maryland School of Medicine, Freshman Lecture Hall, starting at 7 PM.

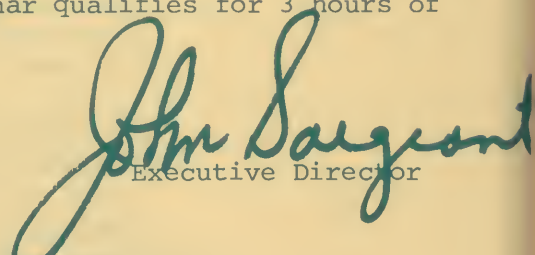

ARBITRATION

The seminar format will consist of the following:

PANEL

- | | |
|------|--|
| 7:00 | 1. Overview of Statute - through panel selection |
| 7:40 | 2. Pre-hearing procedures |
| | Total of 40 minutes |
| 7:40 | 3. Conduct of hearing |
| | 4. Decision-making process |
| 8:25 | 5. Post hearing procedures |
| | Total of 45 minutes |
| 8:25 | Break |
| 8:45 | |
| 8:45 | 6. Mock hearing - editor and lawyers |
| 9:30 | Total of 45 minutes |
| 9:30 | 7. Questions and answers - panel |
| | Total of 30 minutes |

Admission is free and the seminar qualifies for 3 hours of Category 1 CME credit.

Money isn't everything.

It's knowing what to do with it that really counts.

Where to invest it. How to make it grow. Get income from it. Minimize risk and taxes.

That's why it pays to have people around you who make it their business to know. Who are investment management experts.

Like the people in the Trust Division at Union Trust Bank.

For the past ten years, our professional managers have consistently outperformed other financial institutions. The pension and profit-sharing funds and individual trusts we've handled have consistently earned top dollar. Our records prove it.

And we're ready to do our best for your portfolio. Now. First, by sitting down together and discussing your plans. Your goals. Your objectives.

Next, we come up with a program custom-fitted to your needs. To your company's future. Or to your family's future.

Then we keep you up to date by phone, personal meetings and newsletters. So you're never out of touch. And we're never out of reach.

If that sounds good to you, we've made it easy for you to get more details on our personal or corporate investment services.

Just call Larry Rosenthal, our man in charge of personal trusts, at 301/332-5515. Or Jay Neale, in charge of employee benefit plans, at 301/332-5877.

What you do with your money is their business.

"Peeking in" at Peking

Yes, our December, 1978 trip to Red China was fantastic! The timing was indeed fortuitous. The Chinese called us "the first delegation" from the United States to arrive after "normalization of relations" was announced—and we *really* got the "Red Carpet" treatment (the best hotels, well-heated; special treats and marvelous discussions we never dreamed possible there!)

The food was very good, including glazed meats and chicken with nuts, shark's fin soup, pressed duck and Peking Duck, glazed apples and almond milk—all prepared very differently from Chinese food here—and such "exotic" items as squid, octopus, snake and deboned duck's feet! There was fresh fruit and much jasmine tea between meals. Aside from a few colds, our sturdy group of radiologists all stayed well.

We had limited this trip to Hong Kong and Mainland China and were gone 18 days, flying over the Yukon and Alaska one way by day (which never ended as we flew with the sun).

Southern China was lush green and sub-tropical like Florida, while Northern China was white with snow, blustery and bleak in winter. It was fascinating to experience the picturesque contrasts of this vast country of an over 900 million population. Even the stature of the people is different, those in the North seeming larger and more Mongolian in appearance.

We visited schools, communes, factories, villages, old Emperor's palaces (now "the peoples' museums") and

temples in several cities (Canton, Foshan and Peking). We trod up and down the Great Wall, in the Ming Tombs and at the now-famous Poster Walls (or Democracy Wall) in Peking, snugly-layered in our thermal undies, boots and sweaters. We were fortunate, too, in being at the home of State Department friends our first night in Peking when the long Politburo meetings chanced to be concluded. Here we got a firsthand translation and interpretation of the important switches made in the ruling hierarchy and the changing political emphasis decided upon—down-playing future criticism of the "Gang of Four" and stressing modernization and normalization instead, full steam ahead. (Still, Mao's Mausoleum was barely mentioned as we viewed it in huge Tien An Men Square—in contrast to scheduled visits on all recent past itineraries. Mao's pictures and slogans still abound, but pictures of the foursome Marx, Engel, Lenin and Stalin are also around, although Russia is truly hated now.)

There were no limitations to our wandering on our own, so long as we kept our bearings, for the language barriers are great. A few Chinese words of greeting and farewell, thanks, mutual applause, and a smile went a long way, however, and we had wonderful walks down nameless narrow mazes of streets where "the people" live in the "real China."

Quarters are incredibly cramped and sparsely furnished, with a bare lightbulb per room, and one or two rooms per family. A ladder in the front room (or *only* room) leads to a loft for family sleeping, dormitory-style, on the floor—or sometimes mosquito-netted mattresses are at one side of the room, which serves as sitting room, dining room and bedroom. A bare metal spigot with running water serves the occupants of the street who do their wash, etc. outside, and there is a communal bathroom of sorts. Toilets do flush, but are without seats—even in railroad stations and airports! (Some trains have no restrooms and travelers use those at station stops!)

Indelible memories remain of peasants working with water buffalo in the irrigated fields, fishing the rivers from handrowed junks with huge nets, living in sampans or driving along the roads in heavily-overloaded horse-and-donkey-drawn wagons, pedicabs and the strangest vehicles rigged up to run! The congested bike traffic everywhere made us grateful they weren't cars!

With rare exception, the people were warm and friendly, and we had a marvelous time entertaining

DR. AND MRS. LEONARD B. WARRES on the Great Wall of China, with Mongolia at their backs.

(All pictures courtesy of Dr. and Mrs. Warrens.)

SOME SCENES FROM CHINESE MEDICINE: (Top) Patients in a commune clinic outside Canton. (Second down from top) Two patients in one bed. (Third down from top) Patients sleeping head-to-head. (Bottom) Racked surgical gloves.

adorable children and dedicated teachers by spontaneously playing their piano and accordion and singing to them, reciprocating their New Year greetings sung to us. (In Peking, they even had Christmas Eve parties for the first time for all us visiting Americans, providing Chinese acrobats, singers, dancers and other entertainers.)

Medically, the simple commune clinics reminded us of those remote outposts we once visited in the hinterlands of Afghanistan. Families attended patients, newborn babes were sometimes cramped into what looked like drawers, patients were sometimes two to a bed and beds were placed head-to-head! Acupuncture was used for some deliveries and Caesareans.

At the Chi Sheui Tan Orthopedic Hospital in Peking, we witnessed the remarkable work and patients of the famous Dr. Cheng who successfully performs anastomoses of severed limbs and digits on accident victims who are brought to him with their parts within 33 hours of injury. A sweet, modest man, he took us on inconceivable rounds to see for ourselves how a toe substituted for a thumb is permitting a worker to regain hand function, how a completely amputated wrist and hand of another patient are growing back together with amazing sensitivity and motion, how a usable amputated foot was switched to the other limb whose foot was destroyed and not usable. (Here the little and big toes were reversed for necessary balance—not beautiful, but certainly functional!) Even outmoded X-ray equipment was well-utilized with good diagnostic results, and the radiologists were impressed with what was being accomplished.

At dinner and during a four-and-a-half hour delay at the Peking Airport (while the runway was being swept clear of snow with a broom—ambulance at the ready!), we utilized the time in memorable discussions with our guides—who were frank to say they would have been arrested for far less two years ago—but now could talk more freely. In their own political group meetings weekly, however, it was obvious that they still remained cautious about expressing differences of opinion and the need for change.

Relationships between young people are more open now, though far more disciplined than in the West. They are coming to resent being overworked and separated from their families and fiancées on distant job assignments dictated solely by the government's pronouncement of "needing them." Even parents are sometimes separated for as long as 10 years—with visitations permitted only twice a year! This our guide acknowledged required remedy—but "steps would take time."

Women do hard labor side-by-side with men—and alone. Many wear masks against the dust of building and road construction. All are garbed in drab Mao pants and jackets, except the children, who are more

(Top, left) **PEDIATRICS SECTION** in the commune clinic outside Canton. "Yes," says Mrs. Warres, "that's a baby in there!" (Second down from top) **DR. WARRES** (left) with X-ray equipment at the Chi Sheui Tan Orthopedic Hospital in Peking. (Third down from top) **MRS. WARRES** cloaked for hospital rounds. (Bottom) **A VIEW OF THE ANASTOMOSIS OF SEVERED LIMBS** that the author mentions in her story.

colorful. Cotton goods (and meats) are rationed for the Chinese.

Tei chi, slow-motion exercises for physical fitness, are done early each morning outdoors and finished by 7 AM, when everyone disperses for duties. Jogging and badminton are also popular.

There is much "catching up" to be done in China economically—and air pollution is surprisingly a big problem (from their smoky coal and coke-burning vehicles, heaters and factories), but the forces of change have just been unleashed and a new spirit of necessary individual freedoms is abroad in the land—at least among the educated. Where it will lead remains to be seen, but times ahead will surely be exciting and eventful!

(MRS. H. LEONARD) MARGIE B. WARRES

AUXILIARY/MMPAC MEMBER MRS. HELEN BOYER speaking to Auxilians of the 50 states at the 1978 Annual Fall Confluence in Chicago. Mrs. Boyer was National Auxiliary Health Projects Chairman.

SEMIANNUAL MEETING DATES

Sept. 12-16, 1979—Royal Sonesta Hotel—New Orleans, LA

New Auxiliary President Mrs. Strauss

Mary Maddry Strauss is a native of Richmond, VA, but her accent still places her as being from North Carolina, which she claims is her real home. Following graduation from Durham High School, Mrs. Strauss received her BA degree in English from Duke University. A dean list student, she served as President of the Woman's Student Government Association. Among other campus honoraries, she was listed in **Who's Who Among Students** and, upon graduation, received the Algernon Sydney Sullivan Award.

After teaching Latin and English in Albemarle County, VA, Mrs. Strauss returned to Duke as a member of the Dean's Staff of the Woman's College. In 1963, she married Albert John Strauss, Jr., a senior medical student at the University of Virginia. Following internship at Duke, the couple returned to Charlottesville, where Dr. Strauss completed his residency in pediatrics and Mrs. Strauss continued her teaching and graduate work. She received a Master's Degree from the University of Virginia in 1967.

After a two-year tour of duty with the Air Force at Castle AFB at Merced, CA, Dr. Strauss entered into partnership with Dr. Ronald E. Keyser of Hagerstown; (another pediatrician, Dr. Michael Neimer joined the two in August, 1977.)

Shortly after her arrival in Hagerstown, Mrs. Strauss became active in the Washington County Auxiliary. She served a two-year tenure as Treasurer and two additional years in Vice Presidency positions. (The Auxiliary reached the highest number of members in its history while Mrs. Strauss was Membership Chairman.) She became President in May, 1976.

Upon her installation, Mrs. Strauss wrote to the Medical Society expressing the belief that the Auxiliary could more effectively fulfill its potential if it had representation within the Society itself. It was a unanimous decision; Mrs. Strauss recalls her excitement when she received the gracious letter from Dr. Kit Japzon, Society President, inviting two Auxiliary members to join the Executive Committee in an ex officio capacity. The first representatives from the Auxiliary to the Executive Committee were Mary Strauss and Betty Russell.

During her year in office, Mrs. Strauss assisted in the updating and rewriting of the County Bylaws, making them consistent with the state and national organization. She introduced the Christmas Sharing Card, thereby doubling the county's AMA-ERF contribution over any previous year. The Auxiliary upped its scholarships to three, granting one to a young man for the first time. (In the fall, Washington County hosted the State Board.)

Knowing how Mrs. Strauss enjoys a good laugh, the Doctor's Day Committee of 1978 asked her to write a humorous skit for its March festivities. The result was **Episodes in the Life of Winden D. March, MD**, a three-act playlet starring physicians and Auxiliary members. In covering **Episodes in the Daily Mail**, reporter Libbie

Powell wrote, "This well-written and clever bit of originality on an old theme was the brilliant handiwork of Mary Strauss, who wrote, produced and narrated the work. She was the 'woman of the hour' at its conclusion . . ." (The playwright herself attributes the play's success to the "Phenomenal talent of Washington County.")

In addition to her Auxiliary work, Mrs. Strauss is an active member of Paramount Baptist Church. She was elected the second woman deacon in the church's history and has served in many leadership capacities. Currently, she is completing her fourth year as Sunday School Director. In 1973 she initiated a ministry to the Fairney Keedy Home for the Aged; she continues to direct these monthly programs.

Mrs. Strauss classifies herself as a professional homemaker. She considers mothering three children—Alexandra Elizabeth, 12; Stephanie Lee, 9 and A.J., III, 6—her most important and delightful domestic responsibility. She enjoys cooking and sewing, somewhat wistfully recalling the days when reading, oil painting and knitting occupied more of her leisure time. (Having studied piano for 10 years, she still enjoys playing and is attempting to add some Scott Joplin numbers to her classical repertoire.)

A non-domestic hobby which she enjoys is hunting. Admittedly, she began the sport because of her husband's interest, but now she eagerly anticipates their bi-annual trips to Wyoming where they rough-camp and hunt. She has several buck antelope and one mule deer to her credit.

Always enthusiastic and proud of her professional

family, Mary Strauss is pleased to become the third state president from Washington County. After four years' experience on the State Board, she brings to her new position a deep commitment to the purposes of the Auxiliary and a sincere belief that the organization can and should be a vital, active force which brings recognition not only to itself, but also—and more importantly—to the physicians and Medical Societies which it represents.

Her husband, Dr. Strauss, has been elected President of the Washington County Medical Society and begins his term of office this month, making for two medical Presidents in one family! □

PHYSICIAN PLACEMENT SERVICE

The Medical and Chirurgical Faculty of the State of Maryland maintains a Placement Service for the convenience of Maryland physicians, hospitals and communities in search of candidates for positions available in our state. A detailed description of such opportunities should be forwarded to the Physician Placement Service, 1211 Cathedral St., Baltimore, MD 21201; telephone 1-301-539-0872.

Physicians wishing to locate in Maryland are invited to submit a resume to be kept on file with the Physician Placement Service. Candidates are requested to inform the Faculty when they are no longer available for consideration for opportunities which might be available in Maryland.

Journal announcements on the Classified Advertising page for Physician Placement Service are charged at the regular Classified Advertising rate.

"WE SERVICE WHAT WE SELL"

At Manor Care we have you in mind, too.

When Manor Care coordinates medical services, we keep the physician as well as the patient in mind.

All seven of our Maryland centers offer:

- * A Registered Physical Therapist to carry out any therapy orders you prescribe.

- * A food service manager consulting with a Registered Dietician to provide any special diets your patient needs.

- * A unit dose medication system to ensure the freshness and accuracy of your prescriptions.

- * Extensive in-service education programs to keep the nursing staff up-to-date on new concepts and to review basic geriatric practices.

The Maker

Examining a Few Myths About Prescribing.

Increasing pressure is being put on the practicing physician to prescribe drugs generically. You are told that brand-name products are universally “expensive” and generic versions are relatively “cheap.” To make this case, the most extreme (rather than typical) price differentials are cited. Thus, consumers are led to believe that such differentials are commonplace. Even your knowledge and your motives as a physician are questioned.

Understandably, these views have created myths. We think it's time to examine them in the light of all the facts and ramifications.

MYTH: There are no differences in quality and performance between brand-name products and their generic counterparts. The corollary is that there are no differences among products made by high-technology, quality-conscious, research-based companies and those made by commodity-type suppliers.

FACT: The Food and Drug Administration does a good job in monitoring a generally excellent drug supply. Still, it has nowhere near the resources to guarantee the quality and bioavailability of all marketed products at any given time. Just a few months ago, for example, it noted that batches of tetracycline HCl capsules which met official monograph requirements were

not bioequivalent to a reference product. As you know, there is substantial literature on this subject affecting many drugs, including such antibiotics as tetracycline and erythromycin. The record on drug recalls and court actions affirms strongly that there are differences among pharmaceutical companies and their products. Research-intensive companies have far better records than those that do no research and may practice minimum quality assurance.

MYTH: Industry favors only “expensive” brand names and denigrates all generics.

FACT: PMA companies make 90 to 95 percent of the drug supply, including, therefore, most of the generics. Drug nomenclature is not the important point; it's the competence of the manufacturer and the integrity of the product that count.

Matters.

MYTH: Generic options almost always exist.

FACT: About 55 percent of prescription drug expenditure is for single-source drugs. This means, of course, that for only 45 percent of such expenditure, is a generic prescribing option available.

MYTH: Generic prescriptions are filled with inexpensive generics, thus saving consumers large sums of money.

FACT: Market data show that you invariably prescribe—and pharmacists dispense—both brand and generically labeled products from known and trusted sources, in the best interest of patients. In most cases the patient receives a proven brand product. Savings from voluntary or mandated generic prescribing are grossly exaggerated.

MYTH: Drugs account for a major portion of the rise in health care costs.

FACT: Drugs represent a very small part of such costs. The amount of the health care dollar spent for prescription drugs was about 12 cents in 1967; today it is about 8 cents. And you as a physician are most conscious of how drug therapy can cut hospitalization, avert surgery, reduce office visits and keep patients on the job.

MYTH: Government intrusions into the marketplace will save tax money.

FACT: Government schemes always cost the taxpayer something, and the costs often exceed the benefits. Certainly, any federal “help,” such as lists of wholesale drug prices sent to all physicians and pharmacists, will be no exception. Just think of the expense of keeping them current! Moreover, wholesale prices are poor guides to actual transaction prices and even worse guides to retail prices.

The PMA Position

We believe your freedom to prescribe, either by generic or brand name, should be totally unabridged. Otherwise, your prescribing prerogatives and your relationships with patients will be seriously impaired.

The maker does matter

After the myths about price and equivalency have been shattered, one fact stands out more clearly than ever: *The maker does matter.* As always, your best guide to drug therapy for your patients is to select products—both brands and generics—from manufacturers with credentials and performance records you have come to respect.

Maryland State Department of Health and Mental Hygiene

CHARLES R. BUCK, JR., ScD, Secretary

Secretary Buck

Governor Harry Hughes nominated Charles R. Buck, Jr., ScD, as Secretary of Health and Mental Hygiene and the appointment was confirmed by the State Senate on Jan. 31, 1979. The new Secretary officially assumed his duties on Feb. 1st, replacing Neil Solomon, MD, PhD, the Department's first and only Secretary since 1969.

Secretary Buck was Director of Planning for the Johns Hopkins Hospital and Assistant Professor of Health Services Administration in the Hopkins School of Hygiene and Public Health. An expert in hospital management, health program planning and reimbursement, he also directed the Municipal Health Services Program of the Robert Wood Johnson Foundation.

His chief responsibilities at Hopkins were to develop long-range goals for programs and facilities for the Hospital and the Hopkins School of Medicine, including expansion of staff, budget and programs for the clinical departments affected by the \$83 million redevelopment program of the Medical Institutions.

Named Director of the Johnson Foundation Municipal Health Services Program in 1978, Dr. Buck administered a national program designed to provide additional health care to underserved, inner-city areas. He

was responsible for administering \$15 million in grants to five major US cities, including Baltimore, to set up medical care programs.

While on the Hopkins staff since 1972, Dr. Buck has been involved in planning for the medical institutions, developing strategies for quality assurance, data processing, cost reimbursement, hospital decentralization, manpower planning and student housing requirements. He had been active in studies on the economic redevelopment of the East Baltimore area as well.

In addition, Dr. Buck had served as a consultant to the Bedford Health Associates, New York State; Bureau of Quality Assurance, Health Services Administration, Department of Health, Education and Welfare; the Robert Wood Johnson Foundation; Analytic Services, Inc. and the Center for Community Health Systems at Columbia University.

A native of Peoria, IL, Dr. Buck obtained a bachelor's degree in industrial engineering from Northwestern University, master's degrees in both industrial engineering and public health from the University of Missouri and a doctor of science from the Hopkins School of Hygiene and Public Health.

He has written numerous papers on health planning and management issues.

Dr. Buck, 37, is married to the former Nancy Shores, and they have two sons, Charles III, 9 and Jonathan, 6.

Dr. Buck's office is located in Room 510 of the Herbert R. O'Connor State Office Building at 201 W. Preston St. in downtown Baltimore. □

Dr. David L. Sorley Named New Chief of the Division of Communicable Diseases

In other news, Dr. David L. Sorley was named Chief of the Division of Communicable Diseases at the Department, according to an announcement by Dr. John L. Pitts, Jr., Director of the DHMH Preventive Medicine Administration.

Dr. Sorley has served as Assistant Chief and Acting Chief of the Division since joining the Department in June, 1977. In this position, he has been responsible for the planning and management of medical programs dealing with the control of all infectious diseases with the exception of tuberculosis.

Dr. Pitts said that Dr. Sorley and his staff will be responsible for providing epidemiological assistance in the investigation of potential or actual disease outbreaks and consultative support to Maryland physicians, local health departments and the general public when needed.

The Division, which is part of the Preventive Medicine Administration, was singled out by the Department of Health, Education and Welfare for managing one of the most effective childhood immunization programs in the nation during 1978.

Dr. Sorley managed rural health care programs in Ambo, Ethiopia for three years prior to acquiring a master's degree in public health from the Hopkins University School of Hygiene and Public Health in 1977.

He is a graduate of the University of Minnesota School of Medicine, and resides with his wife and three children in the metropolitan Baltimore area. □

CASE OF THE MONTH

A Service of the Maryland Radiological Society

Co-Editors:

George P. Saba, II, MD

Lee A. Goodman, MD

David McNeely, MD

By JANET F. BROWN, MD; RICHARD CHANG, MD and DARRYL J. GARFINKEL, MD

The authors are in the Dept. of Radiology and Radiological Sciences at the Johns Hopkins Hospital, Balto., MD 21205.

Case History

An 11-week-old, white female was admitted for evaluation of anemia and lymphadenopathy. Physical examination at birth was remarkable for a purpuric rash over the trunk, extremities and soles of the feet. These skin lesions faded within several days. TORCH titers and VDRL were normal.

Physical examination at the time of admission revealed moderate hepatosplenomegaly, generalized lymphadenopathy and scattered purpuric lesions. The hematocrit was 18.5%.

The radiographs shown below were taken at the time of admission. (Figures 1A and B, and 2.)

What is your diagnosis?

Discussion

Letterer-Siwe disease represents the acute disseminated form of Histiocytosis X. The etiology is unknown. It occurs primarily in children under two years of age; females are more commonly-affected than males. This syndrome is characterized by diffuse multisystem involvement. The classical clinical picture includes a purpuric rash involving the skin and mucus membranes, lymphadenopathy, hepatosplenomegaly, soft tissue masses, anemia, fever and thrombocytopenia. Occasionally, diabetes insipidus and exophthalmus may be present. The course of the illness is usually fatal, but occasionally, complete remission can be obtained.

The roentgen features reflect the generalized systemic picture. Ossous lesions involving the flat bones of the skull, pelvis, scapula, ribs, spine and the major long bones of the extremities are common (Figures 1A and B.) Involvement of the bones of the hands and feet is much rarer. Radiographic enlargement of the liver and spleen parallels the physical examination. Diffuse pulmonary infiltration may also be present (Figure 2.)

The bony lesions appear as lytic, ovoid or rounded defects with well-limited margins, not infrequently-surrounded by slightly-denser, scalloped edges. In the skull, these areas have a serpinginous, map-like appearance, and it is referred to as a "geographic skull." Lesions in the mandible may destroy bone surrounding teeth, which appear to be floating on X-ray exam. Otitis media is often associated with destruction of the mastoid and petrous portion of the temporal bones.

Extensive destruction of a vertebral body with preservation of the adjacent disc space is characteristic. This lesion is probably the most frequent cause of vertebral plana.

The initial roentgen picture of the pulmonary lesion generally is a reticular or fine reticulonodular infiltration, bilateral and usually symmetrical. As the lesions progress, a picture of honey-combing may be apparent. Spontaneous pneumothorax is a frequent complication. There is no hilar adenopathy and usually no pleural involvement.

Treatment of Letterer-Siwe is beyond the scope of this case demonstration. Various modalities including surgery, irradiation and multiple types of chemotherapy are used either alone or in combination.

Conduct with Pronestyl® Tablets

Procainamide Hydrochloride Tablets

The only procainamide in
veneer-coated, easy-to-swallow tablets

250 mg

375 mg

500 mg

- available in 3 tablet strengths for easier dosage adjustment—up or down—in all patients
- produced under exacting quality control standards by Squibb—numerous critical control tests from starting material to finished product
- offered only under the Squibb label—your assurance of reliable, quality therapy for life-threatening arrhythmias

See following page for brief summary

PRONESTYL® TABLETS

Procainamide Hydrochloride Tablets

The prolonged administration of procainamide often leads to the development of a positive anti-nuclear antibody (ANA) test with or without symptoms of lupus erythematosus-like syndrome. If a positive ANA titer develops, the benefit/risk ratio related to continued procainamide therapy should be assessed. This may necessitate considerations of alternative anti-arrhythmic therapy.

DESCRIPTION: Pronestyl (Procainamide Hydrochloride) is the amide analogue of procaine hydrochloride and is available for oral administration as veneer-coated tablets providing 250 mg, 375 mg, and 500 mg procainamide hydrochloride.

CONTRAINDICATIONS: In patients with myasthenia gravis and where a hypersensitivity to procainamide exists; bear in mind cross sensitivity to procaine and related drugs. Should not be given to patients with complete atrioventricular heart block. Contraindicated in cases of second degree and third degree A-V block unless an electrical pacemaker is operative.

PRECAUTIONS: Evidence of untoward myocardial responses should be carefully watched for in all patients. In the presence of myocardial damage with atrial fibrillation or flutter, the ventricular rate may increase suddenly as the atrial rate is slowed; adequate digitalization reduces but does not abolish this danger. Ventricular tachysystole is particularly hazardous if myocardial damage exists.

The dislodgment of mural thrombi producing an embolic episode may occur in correcting atrial fibrillation due to the forceful contractions of the atrium.

Extreme caution is required in attempting to adjust the heart rate when ventricular tachycardia has occurred during an occlusive coronary episode or where the use of procainamide may result in additional depression of conduction and ventricular asystole or fibrillation as in second degree and third degree A-V block, bundle branch block, or severe digitalis intoxication.

Bear in mind when treating ventricular arrhythmias in patients with severe organic heart disease and ventricular tachycardia that complete heart block, which may be difficult to diagnose, may be present. Since asystole may result if the ventricular rate is significantly slowed without attainment of regular atrioventricular conduction, procainamide should be stopped and the patient re-evaluated.

In the presence of both liver and kidney damage, normal dosage may produce symptoms of over-dosage—principally ventricular tachycardia and severe hypotension.

A syndrome resembling lupus erythematosus has been reported with oral maintenance procainamide therapy. Common symptoms are polyarthralgia, arthritis and pleuritic pain. Fever, myalgia, skin lesions, pleural effusion and pericarditis may also occur. Rare cases of thrombocytopenia or Coombs-positive hemolytic anemia, possibly related to this syndrome, have been

reported. Measure anti-nuclear antibody titers at regular intervals in patients on procainamide for extended periods of time or in whom symptoms suggestive of lupus-like reaction appear; in event of rising titer (anti-nuclear antibody) or clinical symptoms of LE, assess the benefit/risk ratio related to continued procainamide therapy (see boxed Warning). Steroid therapy may be effective if discontinuation of procainamide does not cause remission of symptoms. If the syndrome develops in a patient with recurrent life-threatening arrhythmias not otherwise controllable, steroid-suppressive therapy may be used concomitantly with procainamide.

ADVERSE REACTIONS: Hypotension is rare with oral administration. Serious disturbances of cardiac rhythm such as ventricular asystole or fibrillation are more common with I.V. administration.

Large oral doses may sometimes produce anorexia, nausea, urticaria, and/or pruritus.

A syndrome resembling lupus erythematosus has been reported in patients on oral maintenance therapy (see Precautions). Reactions consisting of fever and chills have been reported, including a case with nausea, vomiting, abdominal pain, acute hepatomegaly, and a rise in serum glutamic oxaloacetic transaminase following single doses of the drug. Agranulocytosis has been occasionally reported following repeated use of the drug, and deaths have occurred. Therefore, routine blood counts are advisable during maintenance procainamide therapy; and the patient should be instructed to report any soreness of the mouth, throat or gums, unexplained fever or any symptoms of upper respiratory tract infection. If any of these symptoms should occur and leukocyte counts indicate cellular depression, procainamide therapy should be discontinued and appropriate treatment should be instituted immediately. Bitter taste, diarrhea, weakness, mental depression, giddiness, psychosis with hallucinations, and hypersensitivity reactions such as angioneurotic edema and maculopapular rash have been reported.

For full prescribing information, consult package insert.

HOW SUPPLIED: Pronestyl Tablets (Procainamide Hydrochloride Tablets) providing 250 mg, 375 mg, and 500 mg procainamide hydrochloride are available in bottles of 100 and Unimatic® single-dose packaging in cartons of 100. The 250 mg and 500 mg tablets are also available in bottles of 1000.

'The Priceless Ingredient of every product is the honor and integrity of its maker.'™

Jesse C. Coggins Memorial Building Dedicated by the Faculty

By BLAINE TAYLOR

(Photography by Joseph E. Jensen, Faculty Librarian).

Contact Mr. Taylor, *Journal* Managing Editor, for reprint and other data c/o the *Journal*, 1211 Cathedral St., Balto., MD 21201.

Dr. Pillsbury Speaks

On Feb. 6, 1979, William A. Pillsbury, MD, then President-Elect of the Medical and Chirurgical Faculty of the State of Maryland (now President) stood before a distinguished group of Free State physicians, Mrs. Jesse C. Coggins (widow of the former Faculty member), Baltimore Mayor William Donald Schaefer and Med-Chi staffers to make the following remarks in memory of the late Dr. Coggins, in whose honor the building at the rear of the present Faculty headquarters at 1211 Cathedral St. in downtown Baltimore was being dedicated:

"It is fitting that the Medical and Chirurgical Faculty dedicate this building to the memory of Dr. Jesse C. Coggins, for Dr. Coggins was not only a builder of a sanitarium—he was also a builder, long before most, of humane treatment of the mentally-ill and the alcoholic.

"Dr. Coggins was a 50-year member of Med-Chi and maintained his interest in medicine until his death in 1963 at the age of 88.

"Dr. Coggins made a generous donation to the Faculty in 1961 in order to establish a lectureship on geriatrics. These lectures have been given every year since 1963 at the Annual Meeting and have been a source of invaluable information to the physicians of Maryland. In his Will, Dr. Coggins made an extremely generous bequest to our building fund, and it is due to this that we are here today.

"We are indeed fortunate and honored to have Dr.

Coggins' widow, Mrs. Helen Alexander Coggins, with us today so she can witness some of the fruits of his and her generosity."

The Mayor's Part

Mayor Schaefer conducted the formal dedication of the building itself, which was formerly part of City Public School No. 49, the renovated gymnasium on Maryland Ave. between Preston and Biddle Sts. The Med-Chi effort represented the commitment of the Faculty to the Midtown-Belvedere renewal area in which Mayor Schaefer has been such a driving force.

The Building

"The two-story building was built around 1900 as a gymnasium for the University School for Boys, a private, non-sectarian, preparatory school owned by William S. Marston. The school was more familiarly-known as the Marston's School for Boys," according to a press release issued by Faculty Communications Director Elza Davis. Further, the release stated, "During the 1940s and '50s, the building was known as School No. 49 or the Robert E. Lee Junior High School. The property includes the main school building facing Cathedral St. immediately adjacent to the present Faculty Building.

"Plans are underway to renovate the main building to serve as expanded headquarters for the medical society. The Coggins Building will house a number of medically-related groups, including the Maryland Psychiatric Society, the Renal Dialysis Network, the Maryland Foundation for Health Care and the Med-Chi Insurance Agency."

A spokesman for the Baltimore City Public School System, William Rock, stated that the City first acquired the entire property in September, 1907, relinquishing it to Med-Chi 70 years later.

DEDICATION SPEAKERS included (left to right) Dr. Russell S. Fisher, the Very Rev. Constantine Monios (both seated), Baltimore Mayor William Donald Schaefer (at podium), Dr. William A. Pillsbury (partially-hidden by podium) and Mrs. Coggins (seated.)

COVER SHOTS: 1) Mayor Schaefer and Mrs. Coggins with plaque honoring the late Dr. Coggins. 2) Building entrance. 3) A larger view of the structure. 4) Dr. Pillsbury speaks; Mayor Schaefer and Dr. Fisher at left.

DOCTORS - Ever feel like you want to escape from the daily routine and constant activity that is so much a part of your everyday lives?

Leave your worries far behind when you fly off to the Bahamas, Hilton Head, the Florida Keys, or that extra special vacation spot!

Prophylaxis of Thromboembolic Disease

By MATTHEW J. GIBNEY, III, MD

Introduction

The goal of this paper is to help practitioners form a realistic philosophy about prophylaxis of thromboembolic disease. There is increasing evidence that venous thromboembolic phenomena may be a preventable complication in many hospitalized patients. Evidence of previous thromboembolism can be found in more than 60% of routine autopsies.¹ Pulmonary embolism is a frequent postoperative complication in general surgery, orthopedic and gynecology patients. It is the most common cause of death in the elderly injured.² The average general surgeon can expect two deaths every five years from pulmonary embolism. If prophylaxis was 80% effective, 4-8,000 lives could be saved annually in the United States.³ Non-fatal pulmonary embolism is three times as common as fatal pulmonary embolism.

Major surgery causes changes in blood coagulation:⁴

Increased plasma procoagulants

Increased fibrinogen levels

Thrombocytosis (Sharnoff has shown a release of megakaryocyte products from the lung under stress, contributing to hypercoagulability.⁵)

Increased platelet reactivity

Defective fibrinolysis.

These changes in blood coagulation are augmented by:⁶

Venous stasis of recumbency/immobilization

Advanced age

Obesity

Neoplasia

Congestive heart failure

Trauma to the lower extremities

History of previous thromboembolic disease

Oral contraceptives.

Most physicians have patients that fit several of these categories.

•

Over 85% of pulmonary embolism is from the lower extremities. Most of the remaining 15% are from the pelvis and inferior vena cava. Patients with blood group O have been reported to have a lower risk of thromboembolism; 50% of clots at and above the popliteal level can be expected to embolize.⁷

Therapy after pulmonary embolism is often too late. Two-thirds of deaths from major pulmonary embolism occur in the first 30 minutes following the embolization; 50-80% of pulmonary emboli occur without previous signs of peripheral venous thrombosis.⁸ Pulmonary embolism can be misdiagnosed, and resultant full heparinization carries up to a 20% incidence of bleeding complications; therefore, prophylactic measures are necessary in selected patients to prevent

exposure to several unnecessary risks. By ¹²⁵I-labelled fibrinogen scan (a highly reliable non-invasive study⁹ and phlebography, deep vein thrombosis has been diagnosed in:¹⁰

Stroke	60%
Hip fractures	54%
Open prostatectomy	50%
Myocardial infarction	34%
General surgery patients over age 40	28%
Gyn. patients with abdominal procedures.	20%

Two percent of unprotected patients over 40 who have elective hip surgery can expect to die from pulmonary embolism.¹¹

Coagulation

Hemostatic repair starts with local release of ADP from the injured blood vessel wall. Attracted by this, platelets adhere to the exposed collagen and subendothelial structures, releasing more ADP from the platelets. The platelet mass provides a lipid surface (Platelet Factor 3 - PF-3) acting as a catalyst for the coagulation process. Also, thromboplastic substances activate the extrinsic coagulation mechanism, and activate factor XII which initiates the intrinsic mechanism. There is a "cascade" of activation by the two pathways (Figure 1).¹²

Low-dose heparin interrupts the coagulation cascade by inactivating the activated Factor X (X_a) at the common pathway. Thrombin, the subsequent activated form of prothrombin, is the most potent activated factor. It potentiates factors V, VII, VIII and X and enhances platelet aggregation. Full heparinization is required to block the thrombin-to-fibrinogen step of coagulation.

Arterial thrombus (white thrombus) is primarily platelets with relatively little fibrin. Platelets adhere more quickly than fibrin. Venous thrombus (red thrombus) is mainly fibrin from the coagulation cascade.

Anticoagulation

To appreciate prophylaxis of thromboembolism, we must understand anticoagulation. Less is known about anticoagulation than of coagulation.

We are protected from excessive activation of our clotting mechanism by an Alpha-2 globulin known as Antithrombin III (heparin cofactor). This comes from the liver and inhibits several coagulation proteinases of factors VII, IX, X, XI and XII by modifying the serine residue.¹³

During coagulation, factor X operates at the beginning of the final pathway through which essentially all known coagulation activators must pass. This coagula-

tion sequence functions as a biologic amplification system—it takes less energy to stop intravascular coagulation at the factor X_a stage than at the subsequent thrombin stage. Clotting is inhibited without measurable changes of the coagulation profile. Heparin increases the rate at which antithrombin III combines with X_a.³

Birth control pills and estrogens retard the rate of antithrombin III neutralizing X_a, but this is reversed by small amounts of heparin.¹⁴

Coumarin (originally a rat poison) antagonizes the Vitamin K-dependent formation of:

Plasminogen activators are liberated from the endothelium of the microcirculation by vasoactive stimuli, epinephrine, shock, bacterial pyrogens, hypoxia, histamine and tissue damage. It is through this plasminogen activator-antiplasmin balance that the fluid property of the blood is maintained and we are protected from excessive clotting.

Methods of Prophylaxis of Thromboembolism

- Mechanical
 - Elevation
 - Compression
- Medicinal
 - Coumarin
 - Heparin
 - Antiplatelet Drugs
 - Dextran
 - Dipyridamole
 - Aspirin
 - Defibrinogenating Agents.

The end-point of all treatment is early full ambulation. Most deep-vein thrombophlebitis occurs before or during operation (50%),¹⁵ and immediately postoperatively with its hypercoagulability, dependency and sluggish flow. Spinal anesthesia is not recommended with anticoagulation.

Elevation is simple and accomplishes venous drainage, but one cannot always maintain elevation pre-, intra- and postoperatively. It is of modest value.

Elastic Stockings. Ace wraps are imprecise and can tourniquet. Teds-type thigh-high stockings have been shown to significantly increase clearance of contrast material from deep veins intra-op in 18 minutes as opposed to the patient's other leg control of 32 minutes.¹⁶

Leg Exercises are useful and physiologic, but of short duration and cannot be done under anesthesia.

Electrical Stimulation of Calf and Pneumatic Compression are more effective, but cumbersome.

Prophylaxis by medication can maintain a continuous level of anticoagulation.

Coumarin. In several ways, this is superior to low dose heparin. It has even been used successfully to prevent intraoperative implantation of tumor cells.

15 mg PO night before operation

Maintain Pro Time 1½ times normal

No Increased transfusion requirement

Interacts with other drugs

May skip dose on day of operation.

In a study of hip fractures by tagged fibrinogen scan Sevitt showed significant effect of coumarin prophylaxis (Figure 3).¹⁷

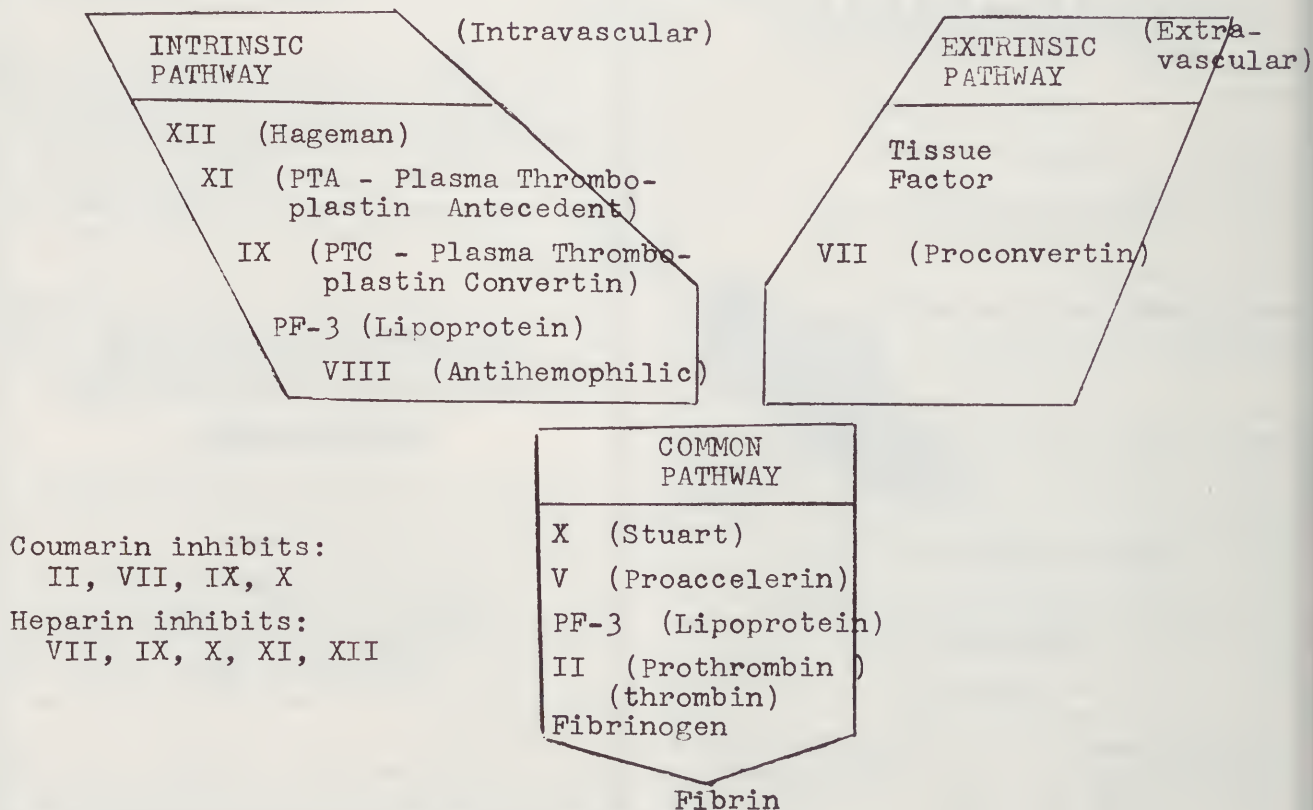

FIGURE 1

Coumarin inhibits:
II, VII, IX, X

Heparin inhibits:
VII, IX, X, XI, XII

Factor	$\frac{1}{2}$ -Life
II	60 hrs.
VII	6 hrs.
IX	20 hrs.
X	40 hrs.

The $\frac{1}{2}$ -life is the reason for the delay in action.

There are coagulation inhibitors (fibrinolysins, plasmins) which digest fibrin and fibrinogen, the thrombolytic system (Fig 2): ¹²

Thrombolytic System

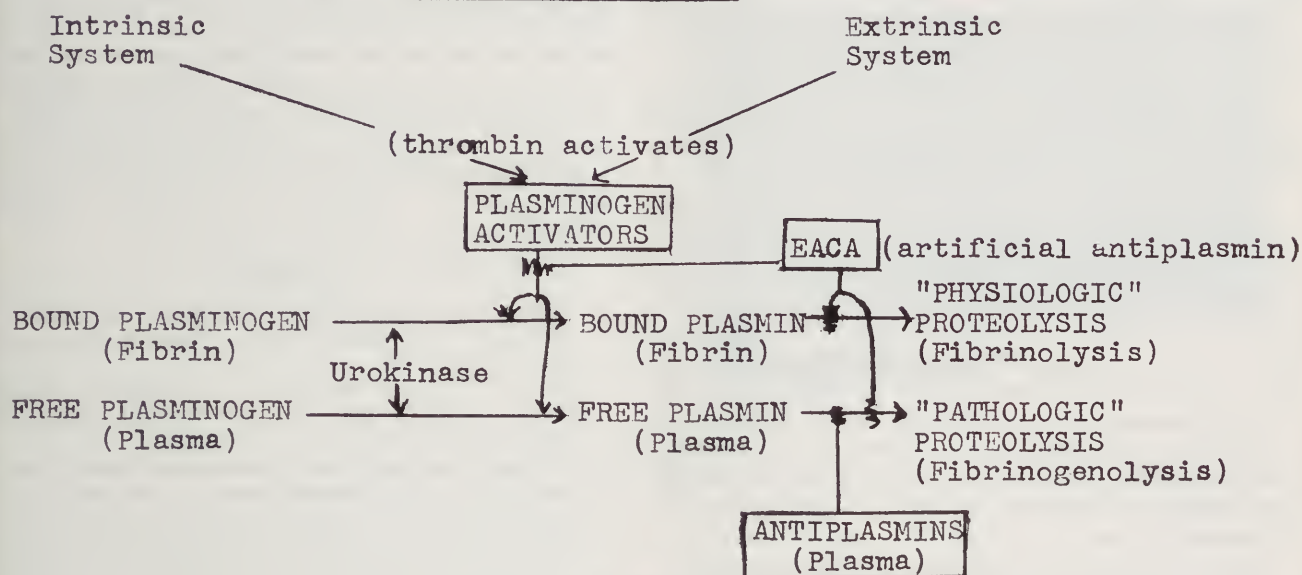

FIGURE 2

Figure 3: Hip Fractures

	Control	Coumarin
Venous Thrombosis	28.7%	2.7%
PE	18%	0
Fatal PE	10%	0

Heparin was discovered by a 2nd-year medical student at Johns Hopkins in 1916. It is made in most cells of man and is not normally detected in plasma. Commercial preparations are made from intestinal mucosa of cattle and hogs, and bovine lung. The $\frac{1}{2}$ -life is $1\frac{1}{2}$ hours, but the disappearance rate decreases with increasing dose. It doesn't cross the placenta as does coumarin.¹⁸

Patients with thrombocytopenia have an increased sensitivity to heparin. Platelets themselves have an anti-heparin activity—"platelet factor 4." One unit of heparin is neutralized by platelet factor from 5×10^5 platelets.¹⁸

Low-dose heparin was first suggested by Bauer in 1954. Sharnoff in 1966 first reported a controlled trial of low-dose subcutaneous heparin.⁵ The current regimen is:

- 5,000 units SQ 2 hrs. pre-op
- 5,000 units SQ q 8-12 hrs. until fully ambulatory
- No coagulation studies are necessary
- Single-dose ampoule is recommended
- Up to a 25% hematoma rate has been reported.

Kakkar reported the most extensive study of low-dose heparin prophylaxis by evaluating 4,121 patients over age 40 undergoing a variety of elective surgical procedures (Figure 4). He reported 16 control pulmonary embolism deaths vs. two pulmonary embolism deaths in the treated group ($p < 0.005$). Although no increased transfusion requirement was reported, heparin was stopped in 3.4%. Wound hematoma rate was significantly elevated ($p < 0.01$).¹⁹

Figure 4: Deep Vein Thrombosis

	Control	Low-dose Heparin
General Surgery ¹⁹	24.6%	7.7%
Elective Surgery ²⁰	16.1%	1.9%
Hip Fracture ²⁰	48.0%	13.0%

How does low-dose heparin therapy compare with coumarin? Ritter at Indiana University compared the two in 300 total hip replacement patients (Figure 5).²¹

Coumarin appears to offer better protection. Average blood replacement, however, is misleading in that hematomas developed more slowly, but in equal number.

Antiplatelet Drugs: Although the bulk of venous thrombus is a red clot with fibrin strands and intermeshed erythrocytes, there is evidence that the initiating event may be a small nidus of platelets that accumulate on an area of endothelial abrasion.

Dextran: either causes a decrease in platelet adhesiveness and/or a defect in the release reaction. Dr. John Bergen of Northwestern University states that dextran antagonizes Factor VIII and markedly increases collateral circulation.²² Low molecular weight dextran is usually used; 20% of the molecules are greater than 50,000 and above the renal threshold. 500 cc. is given during operation and each day for four days, then every three days until fully ambulatory. Bleeding complications are slightly less than those of oral anticoagulants. Studies vary, but dextran is generally less efficacious than low-dose heparin. Pulmonary embolism is decreased, but not deep vein thrombosis.²³⁻²⁴

Dipyridamole: Persantin® has been shown to be ineffective alone in two controlled trials. There is some synergism when combined with aspirin.

Aspirin. A low dose (1 mg./kg.) can prevent release of platelet ADP for up to seven days and prolong the bleeding time. The huge doses of a rheumatoid arthritic (5-16 grams a day for 2-11 days) will prolong the pro time by inhibiting hepatic synthesis of coagulation factors.²⁵ Aspirin suppositories still cause gastric erosion. Aspirin is of proven value in the arterial disorder of amaurosis fugax, but not of the same caliber as coumarin or heparin in venous thrombosis.²⁶ When used, one 325-mg. tablet twice daily is recommended. Antiinflammatory agents are of no value in venous thromboembolism.

Defibrinogenating Agents: A British study using continuous IV infusion of the Malayan pit viper venom Ancrod found a reduced complication of pulmonary embolism, but the same incidence of deep-vein thrombosis, although less extensive in the treated group. There was a reliable decrease toward 100 in the fibrinogen level. There is no proven clinical usefulness yet,²⁷ however.

Cost

Heparin	\$1.32 per 5,000 unit ampoule
Coumarin	\$0.05 each. Pro time \$10.00
Dextran	\$1.48 500-cc. bottle
Aspirin	Negligible.

Conclusion

After reviewing recent literature with all possible permutations of comparisons, it is apparent that prophylaxis is worthwhile to decrease deep-vein thrombosis. We don't see this grossly, but it is readily ap-

parent by phlebography or tagged fibrinogen scan. With prophylaxis, the incidence of documented pulmonary embolism in high-risk patients is reduced from 10-20% to 2-5%. The incidence of wound hematoma is definitely increased, an important consideration. This is certainly unacceptable in intracranial surgery. At times it is necessary to rely on the less efficient mechanical methods of prophylaxis.

In a young man with an uncomplicated inguinal hernia, there is little need for prophylaxis of thromboembolism. In a patient without operation who is at increased risk, you have much to gain by prophylaxis. In the very high-risk patient who may or may not require an operation, you might be out on a legal (not to mention medical) limb if you didn't provide the benefit of prophylaxis of thromboembolism. In these patients, I would recommend prophylaxis with low-dose heparin or coumarin, with dextran or aspirin as second and third-best choices, respectively.

Dyslexia—A Lead Toxicity Symptom?

By BARBARA A. SOLOMON, MD, MA, PA

For reprint and other data, write Dr. Solomon at 8109 Harford Rd., Balto., MD 21234.

Abstract

A pilot study was undertaken with two groups of children compared on the basis of hair lead levels. The higher lead values correlated with dyslexic children. They were treated with ascorbic acid, zinc and other minerals, B complex and placed on a sugar-free diet. Other specific food hypersensitivities were also deleted. The experimental group improved steadily in their scholastic performances, attendance records, lengthened concentration spans and greater emotional stability. Preliminary findings indicate that dyslexia may be a form of chronic low-dose lead poisoning. Cadmium and copper and food hypersensitivities may also be implicated in the dyslexia-hyperactivity syndrome.

Introduction

There is a growing concern among parents and teachers about the problems of dyslexia and hyperactivity among our school children. At the conference of the American Academy of Preventive Medicine in Denver during 1975, Dr. Hitchings reported on the correlation between hyperactivity in children and lead by hair analysis. I felt it would be important and worthwhile to undertake a similar experiment with the patients who come into my office.

Accordingly, I set up two groups of children for studies of hair lead levels. The experimental group consisted of 10 children with reading and disciplinary problems, six of whom had been referred to me by several school authorities. Friends, neighbors and staff members furnished 22 children described as "normal" and well-adjusted for the control group; however, preliminary screening eliminated half that number, six of whom showed evidence of neurological problems.

One I actually transferred to the experimental group. The remainder selected for the control group evidenced no delay in neurological development and no current school problems, and were personally examined by me.

Materials and Methods

Both groups of children were instructed to shampoo their hair seven days prior to a haircut, using no cream rinse or hair spray. Approximately half a cup or two tablespoons of hair was clipped from the nape of the neck of each child and the clippings mailed to Computer Laboratory Services, Inc., PO Box 6293, Dallas, TX 75222. The laboratory's spectrophotometrical analysis tests cross the spectrum for toxic and non-toxic minerals.

I prefer hair analysis because this method is a truer representation of total body lead burden. Blood lead reflects intestinal absorption, which varies from day to day depending upon the amount ingested. In a study of 17 children with lead intoxication, Kopito et al found that tissue "hair" stored lead and recorded the time and duration of exposure and lead accumulation. The hair test results for the experimental and control groups have been tabulated below.²⁻⁴ (Table 1.)

Results

The higher lead values correlated with dyslexic children. The control children showed lead, but a significantly lower amount. The mean lead level of the dyslexic child was 2.44 mg.% as compared to 0.66 mg.% in the control child. The means of the lead levels in the experimental and control groups were compared and the differences of each child from his or her mean was squared. For this small number of samples, the formula for the critical ratio is as follows:

Critical Ratio T test =

$$\frac{\bar{X}_1 - \bar{X}_2}{\sqrt{\frac{S^2}{n_1} + \frac{S^2}{n_2}}}$$

$$S^2 = \frac{\text{Sum } (X_1 - \bar{X}_1)^2 + \text{Sum } (X_2 - \bar{X}_2)^2}{n_1 + n_2 - 2}$$

$$S^2 = 2.468$$

$$\text{Critical Ratio} = 2.5936$$

The probability that the difference between the two groups was due to chance alone was less than 1%.

Treatment

The dyslexic children were treated with ascorbic acid from 1.5-3 gm. per day and zinc 30-60 mg. per day. Dr. Carl Pfeiffer suggests that high level of blood lead may be reduced by zinc and ascorbic acid which acts as a reducing agent and also binds the metal ions that affect the movement across biological membranes.⁵ In addition, the vitamin B complex and other minerals were prescribed as I believe the normal ones such as calcium, magnesium, manganese and chromium have a protective effect against lead poisoning.⁶ Sugar as well as other specific food hypersensitivities were deleted from the diets of the dyslexic children. The loss of urinary calcium due to excess glucose may well predispose the individual to lead toxicity since the freed metal ion site becomes available.⁷

The four experimental children who remained under supervision all seemed to improve steadily in their scholastic performances, attendance records and longer concentration spans. Several were able to drop their special reading classes. They appeared to have greater emotional stability and a higher frustration tolerance. A dramatic improvement followed the removal of specific food allergies, the experi-

mental group averaging from two-five apiece. Most important, there were no apparent side-effects from the ascorbic acid-B complex-minerals-diet therapy as opposed to those occurring in lead toxicity patients treated with EDTA penicillamine.⁸

Case Highlights

JM, a six-year-old boy: Hyperactive, difficulty sleeping, frequent colds. Hard time settling down in school, wiggles. Initial blood serum lead 36 ng./dl.; repeat lead serum level two months later 15 mg. Food allergies: sugar, honey, molasses, gluten. Much less disruptive in my office on second visit, much less hyperactive, fewer colds. Mother reported school said child doing bet-

ter. MB, seven-year-old boy: Failed second grade, couldn't concentrate. Transferred from control group to experimental. Has calmed down, less awkward. Learned to ride a bike.

JG, 10-year-old boy: Learning problems, poor handwriting, poor motor coordination, pains in legs. After six months, teachers reported reading improvement, better concentration, lengthened attention span. When he skipped vitamins, regressed for awhile, but once back on therapy made up for lost time. Last visit reading therapist felt he was now where he belonged, able to compete scholastically with other children.

TM, 11-year-old girl: Mildly-retarded, walked at 13 months, sat up at 6½ months. Subsequently found with abnormal encephalogram for which 100 mg. of dilantin twice a day. High level cadmium only, low level on five normal minerals, high on zinc. Normal serum cadmium 13 months later. Food allergies: sugar, limited tolerance for milk and gluten products. After 15 months' therapy, reading started to improve.

LL, seven-year-old boy: Encephalitis at age four, pneumonia three times, history of allergy, food: sugar, honey, molasses, gluten, wheat germ. Poor motor coordination, difficulty buttoning shirt, speech difficulties, leg pains. After 15 months improved physically, gained eight pounds, jumps and runs faster, less falling down, better coordination. Writing, math improved, better behaved.

JS, 10-year-old boy: Reading problems, short attention span, left strabismus, taking ritalin, poor appetite. After 15 months therapy, able to go off retalin, missed no time from school, report card zoomed from only two Ns to 13-14 Ns. Reading therapist discharged him. Food allergies: sugar, milk products, dates, raisins, figs, wheat, rice and corn.

LW, 14-year-old boy: Fell out of tree house, hit in head with ball, involved in car accident. One reported suicide attempt, diagnosed as schizophrenic at one point. Lead level 7½ times higher than normal, cadmium two times higher and copper four times higher than normal. Food allergies: eggs, milk, beef, poultry, sugar. Improved after two months treatment, then lost to followup.

A repeat hair analysis was performed a year later on two subjects and, to my astonishment, the hair lead level in my star patient had actually risen! I don't know to what to attribute this surprising increase.

Discussion

Niklowitz et al demonstrated that the amount of copper, iron and zinc in the brain tissues decreases as the amount of lead increases.⁹ Lead interference with copper con-

taining enzymes such as monoamino oxidase and dopamine beta hydroxylase involved in neurotransmitter syntheses or catabolism, can induce neurological disorders recognized as early signs of inorganic and organolead intoxication. Interference with cytochrome oxidase affects metabolic pathways such as respiratory chain and ATP syntheses complex resulting in loss of structural integrity and death of cells and functional disorders.¹⁰⁻¹¹ Niklowitz showed that lead poisoning in humans and animals produced neurofibrillary tangles and vacuolization in the hippocampus and I-II layers of the pyramidal layer of the cerebral cortex.¹²⁻¹⁴

Niklowitz suggests that the displacement of copper, iron and zinc is the doorway by which lead gains ascendancy. The same subjects with high lead also showed high levels of cadmium and copper and low levels of non-toxic minerals. The mean levels of the latter minerals were about the same in both groups except for lower calcium and magnesium in the experimental, but the differences were not significant statistically. There was a considerable range in the individual mineral levels with the highest lead patient and the healthiest control subject displaying the most striking contrast.

Discussion

What is the source of heavy metals in these children? There is atmospheric lead from auto exhaust and industrial pollutants. Besides lead paint, other lead compounds products are pencils, comic strips, pottery and toys. The acidic syrups in softdrink vending machines leach out copper and cadmium during overnight contact.¹⁵ Tapwater is believed a principal culprit for heavy metal poisoning. Copper pipes soldered with tin and lead dissolve into the drinking water if the latter is slightly acid. Afterwards, it occurred to me that these dyslexic children should have been placed on distilled water reconstituted with seawater to obtain the normal minerals.

Conclusion

This pilot study was interesting from several aspects:

- 1) There is an increased amount of repository lead in the hair of dyslexic children as compared to controls. If the dyslexic child has increased brain lead, then dyslexia may be a form of chronic low-dose lead poisoning.
- 2) The difficulties encountered in assembling a lead-free "normal" control group indicates that mild cerebral disorders due to high lead is quite prevalent and pervasive. For the child of extreme sensitivity, even a so-called "safe level" of lead may be toxic.
- 3) Since these children were treated for food hypersensitivities as well as for increased body lead, dyslexia could be a type of "food poisoning" which causes localized or generalized cerebral edema.

Summary

In summary, although I originally started with the simple premise that lead may be related to dyslexia, copper and cadmium may be implicated also. Whether the cadmium-copper toxicities in the same subjects are separate or part of lead intoxication cannot be deduced from these preliminary findings. Whether lead toxicity and food hypersensitivity are cause and effect or parallel phenomena, in common aggravating the clinical syndrome of dyslexia is unknown, but is much food for thought.

The experimental group represents the tip of the iceberg so to speak. Who knows where the bottom is or just what it represents in individual suffering, burdened families, school dropouts and juvenile delinquency? Since dyslexia is becoming more frequent, the aid of other disciplines should be enlisted to solve this human contamination problem. If the sources of lead poisoning are found and corrected, we can prevent dyslexia in children and senile dementia in adults, and spare lead-burdened victims needless pain and suffering.

Endothelial Stretch Striae in Donor Cornea: Cause, Significance and Prevention

By M.H. ROOZITALAB, MD; J.J. REQUARD, BS; J.A. FOGLE, MD;
W.R. GREEN, MD and C.R. GRAHAM, JR., PhD

This paper is from the Eye Pathology Laboratory of the Wilmer Institute and Department of Pathology of the Johns Hopkins Medical Institutions and the Medical Eye Bank of Maryland. Send reprint requests to W. Richard Green, MD, Eye Pathology Laboratory, John Hopkins Hospital, 601 N. Broadway, Baltimore, MD, 21205.

Introduction

Viable donor corneal tissue is essential for successful penetrating keratoplasty. Recently, we have observed endothelial damage in a number of eyebank donor corneas in the form of parallel and mosaic striae, best seen on retroillumination, and have made histopathologic and ultrastructural correlations of the damaged areas.

We believe that a modification of eyebank technique, along with preoperative inspection of donor corneal buttons for striae, will contribute to the elimination of this as another possible factor for early endothelial failure in grafting.

Case Reports

Case 1: A 27-year-old black male died in an automobile accident. The corneoscleral buttons were obtained by the eyebank technician two hours postmortem and were placed in McCarey-Kaufman (M-K) medium for 12 hours. As the corneas were being prepared for keratoplasty, the eyebank technician (JJR) noted striae on the posterior surface of the cornea. We had the buttons transferred into glutaraldehyde/formalin fixative for further study.

Case 2: A 22-year-old black male died after a stab wound. The corneoscleral buttons were obtained by the eyebank technician two hours postmortem and placed in M-K medium for 11¼ hours. Corneal striae were noted and corneas were transferred into glutaraldehyde/formalin fixative.

Case 3: A 16-year-old black male died of stab wounds. Corneoscleral buttons were obtained by the eyebank technician, who noted striae after removal from the eye. The specimens were prepared for histopathologic examination after having been in M-K medium for 40 hours.

Case 4: A 68-year-old white male died of metastatic carcinoma of the colon. Both corneoscleral buttons were obtained by the eyebank technician five hours postmortem and were found to have posterior striations. The buttons were placed in formalin fixative after removal.

Six corneoscleral buttons (Cases 1, 2 and 3) were fixed in a solution of 4% formaldehyde and 1% glutaraldehyde. Each was bisected, perpendicular to the striae, with one-half button each for light and electron

microscopy. The half for electron microscopy was placed in 2.5% glutaraldehyde for two hours, then post-fixed in 2% osmium tetroxide for two hours, and dehydrated with graded alcohols. These halves were embedded in a mixture of Araldite and Epon epoxy resin (Mollenhauer). Thin sections were obtained and stained with uranyl acetate and lead citrate, and were examined with a JEM 100B electron microscope. Staining for light microscopy included hematoxylin and eosin, Verhoeff-van Gieson and the periodic-acid Schiff reaction.

Regarding the technique of removing corneoscleral buttons, it is generally preferable to obtain corneoscleral buttons from enucleated eyes, because this allows for more precise and careful technique. In medical examiner's cases, however, the corneoscleral buttons are removed from eyes in situ. The accessibility and visualization is less than ideal in these cases. In either instance, a scalpel blade is used to incise the sclera 1 mm. posterior to the limbus at an angle so as to enter the anterior chamber. Curved corneal scissors are used to complete the excision of the corneoscleral button. Care is taken not to allow collapse of the anterior chamber with concave distortion of the cornea. Toothed forceps are then used to grasp the edge of the corneoscleral button and lift it from the remaining portion of the eye.

In most instances, this is accomplished by gentle stripping without any difficulty. On occasion, however, some difficulty is encountered because of residual attachments of the ciliary muscle to the scleral spur. This is presumably due to inadvertent incision behind the scleral spur. In such cases, too strenuous traction on the corneoscleral button leads to distortion of the cornea and tension on the corneal endothelium and Descemet's membrane. This traction is usually the cause of stretch corneal striae. When such attachments are encountered, they should be incised with scissors to prevent damage to the endothelium and Descemet's membrane. The corneoscleral button is then placed in McCarey-Kaufman medium, and stored at 5-10° for several hours.

Results

Light microscopic examination of all these cases disclosed linear areas in which three-to-five endothelial cells were disrupted (Figures 1 and 2). Descemet's membrane and other corneal layers were normal.

Electron microscopic examination revealed endothelial cells and Descemet's membrane to be normal except for the areas corresponding to the stretch striae. There was an abrupt transition from normal endothelium to endothelial cells with ruptured cytoplasmic membranes.

These latter endothelial cells had lost much of their cytoplasm, retaining only nuclei and random organelles (Figure 3).

Associated Descemet's membrane and overlying

FIGURE 1: Low-power view of cornea showing disruption of endothelium (arrows) by stress-induced striae (Verhoeff-van Gieson, x 185).

FIGURE 2: Higher power of stretch striae of the cornea (between arrows) showing cellular disruption (Verhoeff-van Gieson, x 700).

FIGURE 3: Electron microscopic appearance of stretch striae of the cornea showing disruption of endothelial-cell plasma membrane, partial loss of cytoplasmic organelles and relatively normal nucleus. There is an abrupt transition between normal and disrupted endothelium (x 4,400).

stroma were normal in most cases, but in Case #2 vertical cracks in the posterior portion of Descemet's membrane were present in the areas of endothelial disruption (Figure 4).

Discussion

Several factors can be responsible for early graft failure after a technically-successful corneal transplant. An important factor is reduced viability of donor cornea before grafting. There are many points to consider such as age of donor, interval between death and use, preservation technique and systemic and ocular diseases. The biomicroscopic appearance of the donor tissue should be checked in every case. Corneas should not be used for grafting if they show marked foldings, indentations, obvious stromal edema, stromal opacities or, we believe, endothelial striae.

We believe these striae can appear postmortem in an otherwise healthy cornea because of disruption of the endothelial cell membranes by imperfect technique in removing the corneoscleral button from the donor eye. We believe inadvertent incision behind the scleral spur leaves attachments of longitudinal ciliary muscle to the scleral spur and trabecular meshwork. On removing the corneoscleral button without adequate lysis of these attachments, traction on Descemet's membrane and endothelium results in multiple linear areas of stress and endothelial cell disruption. If the force is marked, vertical cracks in the posterior aspect of Descemet's membrane may occur in association with disrupted endothelium. Thus, faulty technique in removal of the corneoscleral button from enucleated eyes, and from eyes in situ, accounts for stretch-induced corneal striae. We have been able to produce such striae experimentally in corneoscleral buttons from eyes with no detectable abnormality on slit-lamp examination before removal.

The focal endothelial disruption can be extensive enough to jeopardize success of a corneal transplant. Although most corneal transplant surgeons can probably cite successful grafts performed using tissue with such gross striae, the effect of endothelial cell-loss is always to be considered. To increase the likelihood of

FIGURE 4: Area of stretch striae of cornea showing disruption of endothelium and vertical cracks in the posterior aspect of Descemet's membrane (arrows) (x 5,400).

successful grafting, the surgeon should be aware of the potentially significant cell-loss the striae represent. Careful technique in removal of donor cornea, so as to avoid these striae, is a first step, followed by the surgeon's careful selection of suitable tissue for grafting.

Summary

Light and electron microscopic studies of stretch striae in donor corneas are discussed. The striae occur as lines on the endothelial surface in parallel or mosaic distribution, best seen by retroillumination. Study of these lines by light and electron microscopy showed disruption of endothelial cell membranes, loss of cytoplasm and vertical cracks in Descemet's membrane. We propose that in evaluation of potential viability of donor material, this entity should be borne in mind, as it represents significant physical damage to a tissue largely responsible for graft success. During removal of the corneoscleral button, it is important to avoid applying vigorous force while stripping the corneoscleral buttons from iris and/or ciliary body attachments. The incisions in removing the buttons should be just anterior to the scleral spur, so as to lessen or avoid such adhesions.

SERIOUS RUNNERS RUN ATHLETIC ATTIC

FOR SERIOUS RUNNERS.

Running is our life. Just as it is yours. We are serious runners. We are Marty Liquori, Greg Fredericks, Ken Schappert, Jeff Howser, Mel Pender, Steve Foster, and many more. In fact, the great majority of our stores are managed by accomplished athletes.

We founded Athletic Attic to provide top quality gear to serious runners like ourselves. And like yourself.

We've been to that breaking point. We've run those hundred mile weeks. So when we select a product for our shelves, we go about it very seriously. And we apply our experience thoroughly.

The result — Athletic Attic consistently has the best selection of running shoes and equipment available anywhere. So if you're serious about running at your best, come to Athletic Attic. We've got what you're looking for. Seriously.

Glen Burnie Mall, Ritchie Highway

Medic Alert Publishes Hidden Medical Condition Index

An index to and prevalence of hidden medical diseases and conditions in the United States has been published by Medic Alert Foundation International in Turlock, CA.

The first publication of its kind, the new booklet indexes 27 categories of hidden medical conditions, ranging from endocrine, nutritional and metabolic diseases through diseases of the blood and bloodforming organs and including diseases of the nervous system and sense organs and diseases of the circulatory system.

The index is classified according to the Eighth Revision, International Classification of Diseases, US Public Health Service Publication No. 1693. It was prepared by a special hidden medical condition prevalence study committee of the Medic Alert Foundation International Board of Directors.

Medic Alert Foundation International is a nonprofit, charitable and tax-exempt organization that provides a unique system of medical identification. Its purpose is to provide fast, accurate information to assist in the diagnosing and treating of individuals with hidden medical problems in emergency medical situations.

Serious allergies, diabetes and epilepsy are a few of the many diseases or conditions why people become members of Medic Alert. When a member cannot communicate his or her problem in an emergency because of unconsciousness, or any other reason, the Medic Alert emblem speaks for that person. It helps to prevent tragic or even fatal mistakes that can be made in emergency treatment if the patient has a hidden medical problem. It is equally valuable in assisting emergency personnel to deliver effective medical treatment.

Copies of the new publication entitled *Why Medic Alert?—Index and Prevalence of Hidden Medical Diseases or Problems* are available from Medic Alert Foundation International, PO Box 1009, Turlock, CA 95380. □

Tenuate[®] C
(diethylpropion hydrochloride NF)

Tenuate Dospan[®]
(diethylpropion hydrochloride NF) controlled-release

AVAILABLE ONLY ON PRESCRIPTION

Brief Summary

INDICATION: Tenuate and Tenuate Dospan are indicated in the management of exogenous obesity as a short-term adjunct (a few weeks) in a regimen of weight reduction based on caloric restriction. The limited usefulness of agents of this class should be measured against possible risk factors inherent in their use such as those described below.

CONTRAINDICATIONS: Advanced arteriosclerosis, hyperthyroidism, known hypersensitivity, or idiosyncrasy to the sympathomimetic amines, glaucoma. Agitated states. Patients with a history of drug abuse. During or within 14 days following the administration of monoamine oxidase inhibitors, (hypertensive crises may result).

WARNINGS: If tolerance develops, the recommended dose should not be exceeded in an attempt to increase the effect; rather, the drug should be discontinued. Tenuate may impair the ability of the patient to engage in potentially hazardous activities such as operating machinery or driving a motor vehicle, the patient should therefore be cautioned accordingly. **Drug Dependence:** Tenuate has some chemical and pharmacologic similarities to the amphetamines and other related stimulant drugs that have been extensively abused. There have been reports of subjects becoming psychologically dependent on diethylpropion. The possibility of abuse should be kept in mind when evaluating the desirability of including a drug as part of a weight reduction program. Abuse of amphetamines and related drugs may be associated with varying degrees of psychologic dependence and social dysfunction which, in the case of certain drugs, may be severe. There are reports of patients who have increased the dosage to many times that recommended. Abrupt cessation following prolonged high dosage administration results in extreme fatigue and mental depression, changes are also noted on the sleep EEG. Manifestations of chronic intoxication with anorectic drugs include severe dermatoses, marked insomnia, irritability, hyperactivity, and personality changes. The most severe manifestation of chronic intoxication is psychosis, often clinically indistinguishable from schizophrenia. **Use in Pregnancy:** Although rat and human reproductive studies have not indicated adverse effects, the use of Tenuate by women who are pregnant or may become pregnant requires that the potential benefits be weighed against the potential risks. **Use in Children:** Tenuate is not recommended for use in children under 12 years of age. **PRECAUTIONS:** Caution is to be exercised in prescribing Tenuate for patients with hypertension or with symptomatic cardiovascular disease, including arrhythmias. Tenuate should not be administered to patients with severe hypertension. Insulin requirements in diabetes mellitus may be altered in association with the use of Tenuate and the concomitant dietary regimen. Tenuate may decrease the hypotensive effect of guanethidine. The least amount feasible should be prescribed or dispensed at one time in order to minimize the possibility of overdosage. Reports suggest that Tenuate may increase convulsions in some epileptics. Therefore, epileptics receiving Tenuate should be carefully monitored. Titration of dose or discontinuance of Tenuate may be necessary.

ADVERSE REACTIONS: **Cardiovascular:** Palpitation, tachycardia, elevation of blood pressure, precordial pain, arrhythmia. One published report described T-wave changes in the ECG of a healthy young male after ingestion of diethylpropion hydrochloride. **Central Nervous System:** Overstimulation, nervousness, restlessness, dizziness, jitteriness, insomnia, anxiety, euphoria, depression, dysphoria, tremor, dyskinesia, mydriasis, drowsiness, malaise, headache, rarely psychotic episodes at recommended doses. In a few epileptics an increase in convulsive episodes has been reported. **Gastrointestinal:** Dryness of the mouth, unpleasant taste, nausea, vomiting, abdominal discomfort, diarrhea, constipation, other gastrointestinal disturbances. **Allergic:** Urticaria, rash, ecchymosis, erythema. **Endocrine:** Impotence, changes in libido, gynecomastia, menstrual upset. **Hematopoietic System:** Bone marrow depression, agranulocytosis, leukopenia. **Miscellaneous:** A variety of miscellaneous adverse reactions has been reported by physicians. These include complaints such as dyspnea, hair loss, muscle pain, dysuria, increased sweating, and polyuria.

DOSAGE AND ADMINISTRATION: Tenuate (diethylpropion hydrochloride): One 25 mg tablet three times daily, one hour before meals, and in mid evening if desired to overcome night hunger. Tenuate Dospan (diethylpropion hydrochloride) controlled-release: One 75 mg tablet daily, swallowed whole, in midmorning. Tenuate is not recommended for use in children under 12 years of age.

OVERDOSAGE: Manifestations of acute overdosage include restlessness, tremor, hyperreflexia, rapid respiration, confusion, assaultiveness, hallucinations, panic states. Fatigue and depression usually follow the central stimulation. Cardiovascular effects include arrhythmias, hypertension or hypotension and circulatory collapse. Gastrointestinal symptoms include nausea, vomiting, diarrhea, and abdominal cramps. Overdose of pharmacologically similar compounds has resulted in fatal poisoning, usually terminating in convulsions and coma. Management of acute Tenuate intoxication is largely symptomatic and includes lavage and sedation with a barbiturate. Experience with hemodialysis or peritoneal dialysis is inadequate to permit recommendation in this regard. Intravenous phentolamine (Regitine[®]) has been suggested on pharmacologic grounds for possible acute, severe hypertension, if this complicates Tenuate overdosage.

Aberrant Breast Carcinoma

Case Report and Review of the Literature

By KHEYROLAH ABEDI, MD; LEOPOLDO SALAZAR, MD;
ANTHONY J. RANERI, MD and NEIL NOVIN, MD, FACS

Dr. Abedi was Senior Resident in Surgery at South Baltimore General Hospital, where Dr. Novin is Director of the Department of Surgery, and Assistant Professor of the Department of Surgery at the University of Maryland School of Medicine; Dr. Raneri is Instructor in Surgery at the University of Maryland, and is on the Staff at South Baltimore General Hospital, where Dr. Salazar is on the Senior Attending Staff. Reprint requests should be addressed to Dr. Novin at 3001 South Hanover St., Balto., MD 21230.

Introduction

The occurrence of aberrant breast tissue is not uncommon. Among the Japanese, the incidence is approximately 1.7% among the males and 5.2% among females;^{1, 2} however, carcinoma of aberrant breast tissue is quite rare. There have been less than 80 cases reported in the surgical literature. Our purpose is to report a case and review the literature.

Case Report

T.J., a 71-year-old white female, developed a mass below the right breast which was noted to be approximately two cm. in size in January, 1975. This was excised and found to be duct cell carcinoma in aberrant breast tissue (Figure 1). At that time, no evidence of adenopathy was noted, nor was any evidence of metastatic spread found with extensive workup; therefore, it was decided that no additional therapy would be offered to the patient. She did well until approximately 1½ years later when she noted the onset of a mass superior to the right breast in the midaxillary line, but not in the axilla. This was approximately three cm. in diameter, slightly tender, movable and soft (Figure 2). Again, no axillary adenopathy was noted. Her breasts were found to be clinically unremarkable. Laboratory data, chest X-ray, bone and liver scans were likewise normal. The xeromammogram was reported as showing slightly suspicious calcifications in the subareolar regions bilaterally, and because of the bilaterality and the negative clinical findings, this was not pursued further. The patient underwent an enblock resection of the mass with an axillary lymph node dissection in continuity on June 1, 1976. The pathologic examination of the tissue removed revealed poorly-differentiated duct cell carcinoma with acanthomatous and giant cell features compatible with breast origin (Figure 3). At this point, it was decided that the patient should receive a course of adjuvant chemotherapy along the lines proposed by Bonadonna and others. To date, she is tolerating this well, with no evidence of distant spread or local recurrence having been noted.

FIGURE 1: Original Biopsy Showing Duct Cell Carcinoma in Aberrant Breast Tissue.

FIGURE 2: Macroscopic Appearance of Recurrent Mid-axillary Line Mass.

FIGURE 3: Poorly-differentiated Duct Cell Carcinoma with acanthomatous and Giant Cell Features with Breast Origin.

Discussion

Embryologically, two parallel lines of thickened epithelium develop from axilla to groin bilaterally on the ventral surface of the four mm. human embryo. These are referred to as the milk lines. As the embryo develops, there is a conglomeration and localization of this epithelium at the area of the fourth intercostal space where the normal mammary gland usually develops. This accumulation of cells subsequently penetrates the subcutaneous tissue and progressively increases in size.² In the normal individual, the milk lines gradually disappear during embryonal development except for the anlage of the normal breast. When this process is altered for some unknown reason, aberrant formation occurs at other sites along the course of the milk line. Accessory breast tissue, however, may appear at any site along the milk line, but the most common is in the axilla, with the next most frequent site just inferior to the normal breast.²⁻³ When glandular tissue is present in an accessory breast, tumor formation can occur. There is some indication that aberrant breast tissue can be an inherited trait as indicated by Klinkerfuss's report of polymastia in four generations of one family, as well as Peterquin and Iwai's report of inherited polymastia.^{1,4}

Any tumor that may occur in the normal breast can occur in aberrant breast tissue with cancer and fibroadenoma being the most common, and cancer actually occurring more often than fibroadenoma.⁵

In a review of the literature, Story noted that many American and English authors were of the opinion that carcinomatous changes in accessory breast tissue occurred rarely.⁶ A series of patients reported with aberrant breasts with a very negligible or almost nonexistent incidence of carcinoma were on the average in an age group much lower than the age group in which carcinoma usually manifests itself in breast tissue. In Geschickter's series, there were seven instances of carcinoma in aberrant breast tissue, all occurring in the axilla. The ages of the patients varied from 39-69 years.⁶ Chiari, in 1958, found only three cases in a series of 918 patients who were operated on for carcinoma of the breast have included no cases of carcinoma of aberrant breast tissue.⁷ Interestingly enough, there have been eight cases of aberrant breast carcinoma reported involving normally functioning third breast and suggested that the prognosis for aberrant breast tissue may be worse than that of carcinoma of the normal breast.⁸ This may be because of earlier metastases to the lymph nodes or, perhaps, like melanoma of the trunk, the pattern of metastases precludes emblock-type dissections.

Surgical treatment of carcinoma of the aberrant breast will depend on the location along the milk line. Axillary location may well be considered for mastectomy and axillary dissection of both aberrant and the normal breast on that side. Other aberrant locations will determine the type of surgery necessary for adequate excision of the primary lesion.

Geschickter noted only one five-year survival, whereas Smith and Greening in 1972 reported three patients who were treated by local excision of the tumor with addi-

tional axillary lymphadenectomy in two. Postoperatively, each patient received radiotherapy to the axilla and supraclavicular region and, in one instance, 3 years has passed with no tumor recurrence.⁹

Summary and Conclusions

Carcinoma of accessory breast tissue is a rare condition, being most often confused with a subcutaneous lipoma. Cogswell and Dickinson and most other authors believe that excision of the axillary tumor including the axillary lymph nodes and tail of the breast is all that is indicated.^{2, 10-11} However, the mode of treatment at present is obviously undergoing tremendous change with the advent of adjuvant chemotherapy. Groups such as those led by Dr. Fisher in the US and Dr. Bonadonna's group in Italy would seem to indicate that adjuvant chemotherapy has its place in aberrant breast tissue with malignancy where the normal enblock dissection cannot be performed.¹²

It appears to be a logical supplement to the surgical treatment to use chemical adjuvant chemotherapy. It is well-established that the incidence of carcinoma occurring in accessory breast tissue is very low and offers some difficulty of diagnosis. Aberrant breast carcinoma has to be treated by wide local excision, followed by chemotherapy.

June 6-8, The Challenge of Rising Costs in Health and Med. Care, workshop sponsored by the Assn. for the Advancement of Med. Instrumentation, Internatl. Inn, Wash. DC. For details, call Renee Pietrangelo, (703) 525-4890.

If you are the trustee of your own Pension or Profit-Sharing Plan you could be making a mistake.

The Pension Reform Act makes trustees personally liable for acts in violation of this statute. A trustee, for example, can be sued for mistakes in plan administration or for errors of judgment in investment management.

Let's face it. Physicians normally are simply too busy being physicians to devote the proper amount of time to their retirement plans. Congress obviously knew this, because one of the major purposes of the Pension Reform Act was to make the management of Pension and Profit-Sharing Plans the responsibility of competent professionals.

First National serves as trustee for a variety of retirement plans, including those of incorporated physicians.

So we ask: from one professional to another, doesn't it make good sense to let a professional perform what he does best?

Call Mr. James Neal at (301) 244-4607, for details.

Questions and Answers

In 1978, the Faculty Library answered 8,870 requests from Faculty members for assistance, a 31% increase over the number of requests answered in 1977. This figure represents the number of MEDLINE searches (1,522), photocopied articles (5,475) and items obtained from other libraries (1,873). While these numbers show the major services offered by the Library to Faculty members, they do not account for all of the Library's activities. In addition, there are telephone reference questions, reference assistance to visitors and circulation of books by mail or interlibrary loan. For now, however, I want to examine the use of the three major services by Faculty members and to use some statistical data to answer questions raised on the Faculty's membership survey discussed last month.

One very common misconception among members who do not use the Library is that only the physicians who live or practice in Baltimore, near the Library, benefit from its services. Many members still believe that they have to come in person to the Library to take advantage of it. On the 1978-79 membership survey, several physicians indicated that the Library's location in Baltimore was too far away for them to make use of it.

Of the 8,870 uses made of the Library's major services (MEDLINE, photocopy and interlibrary loan) by Faculty members in 1978, no more than 1% were in response to physicians who came into the Library. The Faculty Library, unlike most other libraries, functions almost entirely by mail and telephone. In all of 1978, only 808 individuals visited the Faculty Library (less than three a day, on the average), and less than half

of these were physicians. Even those Faculty members in Baltimore who use the Library rely primarily on mail and the telephone. In fact, the Library's records of the individual physicians who used the Faculty Library in 1978 show that the physicians in the county used the Library far more than the physicians in Baltimore City.

Some physicians wrote on the membership survey that they have no need of the Library, since they do not do research or write papers; however, very little of the use made of the Faculty Library is related to research. The majority of the questions that come to the Library are oriented to patient care. Most of the physicians who use the Library are seeking information related to the patients they are currently seeing.

Some physicians indicated that they keep up-to-date with subscriptions to their own specialty journals. It is difficult to define "keeping up-to-date," but a physician would have to be actively reading at least several medical journals in his specialty to keep up with just one-third of the developments in his specialty (assuming he subscribes to the right journals!). He would have to read an additional 35 journals to keep up with the second third of the developments in his specialty. Does any physician find time to read even seven journals regularly?

Some respondents to the survey indicated that they are simply too busy to read and keep up with new developments, but with the prospect that one out of every 10 doctors will face a malpractice claim in the coming year, can any doctor afford not to take the time to keep current?

All this leads up to the ease and convenience of using your Faculty Library privileges. The physicians who do use the Library ask questions about such matters as current therapy for neurogenic pulmonary edema, the effects of vitamin B₆ deficiency in pregnancy or the current status of implantable prostheses for treating urinary incontinence. In response, these physicians receive copies of two or three recent articles, or a list of references from which they can choose items to be sent to them.

Physicians who do use the Library regularly have said that every physician in active practice sees at least one patient a day that raises some kind of question: "What is new in this area? What is the latest treatment? 'Have opinions changed about side-effects or complications?'" Little effort is required to jot a one-line note on your stationery, "Please send me two or three recent articles about" and mail it to the Faculty Library, or, if you choose, you can send requests through any hospital library to which you have access.

As a member of the Faculty, you are entitled to up to 50 pages of photocopy each month at no charge; that amounts to about 10 articles. You will not find a les

Selected Medical Literature Searches

The following are among the computerized medical literature searches provided to members of the Faculty during the month of February, 1979:

- | | |
|---|--------------|
| 1. Spontaneous cancer remissions | 39 citations |
| 2. Thorium and Magnesium in relation to pneumoconiosis | 21 citations |
| 3. Ultrasonography in relation to hydrocephalus and neural tube defects | 41 citations |
| 4. Acute intermittent porphyria | 17 citations |
| 5. Literature reviews on infectious arthritis | 21 citations |
| 6. Toxicity of seawasps | 16 citations |
| 7. Nasal sarcoidosis | 10 citations |
| 8. Children's athletic injuries | 81 citations |
| 9. Adrenal cortical adenoma and Cushing's syndrome | 18 citations |
| 10. CAT scanning of the chest | 12 citations |

If you would like a copy of one of these searches or would like to have a search on any biomedical topic, call or write the Library.

Book Reviews

SNODERM Ed. by Crawford S. Brown, MD, Publisher Waverly Press, Inc. 1978.

A systematized nomenclature of dermatology known as SNODERM is now available. SNODERM is a code nomenclature system that includes the entire spectrum of dermatologic medicine, and is patterned after the systematized nomenclature of pathology and the systematized nomenclature of medicine, and combines the nomenclatures of pathology, medicine and dermatology into a useful and concise source of information. The coding information encompasses and integrates the fields of topography, etiology, function, disease and procedure involving the skin. The useful capabilities are multiple and diverse, involving patient care decisions, vital statistics, patient charges, insurance payments and clinical research. With the coding system, the information can be processed and retrieved rapidly and accurately, and record-keeping is made easier for the physician.

NAVAL AND MARITIME MEDICINE DURING THE AMERICAN REVOLUTION, by Maurice Bear Gordon, MD, Ventnor, NJ, Ventnor Publishers, 1978.

In January, 1778, a Dr. Cochran and the regimental surgeons and surgeons' mates under him sent a letter to General George Washington resigning from the colonial army. The medical officers were protesting the discrimination against regimental surgeons and surgeons' mates in colonial forces that excluded them from sharing in the spoils of battle. Dr. Cochran and his assistants served under General Smallwood, whose regiment had captured a British brig in the Delaware River near Wilmington.

Gen. Washington wrote to Gen. Smallwood insisting that the "gentlemen in the medical line" were entitled to the same privileges as any officers in the division. This account is related in *Naval and Maritime Medicine During the American Revolution* to indicate the regard of the "Father of Our Country" for the medical profession in general. The book also recounts an occasion when Washington personally interceded on behalf of a British naval surgeon to bring about the return of his medical library, which had been captured by colonial forces.

Dr. Gordon's text is a gold mine of information regarding military medicine at the time of the American Revolution, especially as it applied to the Navy. He has consulted libraries and archives of medical societies, universities, historical societies and museums throughout the Eastern United States and England to compile a valuable reference source. Among his topics are the education of the naval surgeon and the medications and instruments available to naval surgeons during the Revolution. A list of American naval surgeons of the Revolution is included, and there are short biographies of a great number of them; 49 plates illustrate the book. Many of these are portraits of individual physicians and copies of title pages from their writings.

Naval and Maritime Medicine During the American Revolution is a credit to Dr. Gordon's scholarship in identifying and searching out the widely-scattered sources necessary to compile this work. The book will please any general reader interested in the history of military medicine, and is available in the Faculty Library, as are all books reviewed here.

Hopkins Cleft Lip Study Still Seeking Mothers

Mothers of children with cleft lip who are planning another pregnancy are urgently needed in a Johns Hopkins research study aimed at finding factors leading to this birth defect. Cleft lip is the second most common birth defect in the US and occurs in approximately one in every thousand births.

"When we initiated our search for women to participate in this study in October, 1978, we got an excellent response from women all over the country. We have found our half of the number of mothers we need to complete the study," according to **Jennifer Niebyl, MD**, Assistant Professor of Gynecology and Obstetrics at Johns Hopkins and Director of the project.

"We are looking for women who either are planning a pregnancy soon, or who are still very early in a current pregnancy," she explains.

Prior research has shown that there is a genetic predisposition to cleft lip, but there may be environmental factors which interact with the genetic factors, according to Dr. Niebyl.

"Cleft lip appears in families, but in such a random way that it is not a predictable genetic problem," Dr. Niebyl points out. "It is possible that there are factors in the mothers' system during pregnancy which may lead to the defect, and we would like to find out what they are."

To volunteer, participants should be:

- a) a mother of a child with cleft lip, with or without cleft palate where neither parent has a cleft lip
- b) less than three months pregnant, or planning to become pregnant soon.

Volunteers are tested by the nurse coordinator, **Laura Rocco, RN**, who takes a routine blood and urine sample. If the volunteer cannot come to Hopkins for the tests, Ms. Rocco may go to the volunteer's home or arrange for blood and urine samples to be sent to the Hospital. Testing is free, and only mothers will be tested.

Women interested in participating in this study should call **Laura Rocco** at Hopkins, at (301) 955-8672. Those outside of Baltimore may call collect.

Dr. Misbah Khan Honored

Med-Chi member Dr. Misbah Khan was recently presented with a Maryland PTA Life Membership. In accepting the honor, Dr. Khan made the following remarks:

"Membership in the Maryland Congress of Parents and Teachers is a rare and singular honor for me. I am proud to be a member of your great organization and to formally join hands with all of you as parents and teachers in a joint commitment to children. You will agree with me when I say that our children teach us more about life's truths than any other single source.

I have learnt that there are no "bad" children—they are whatever we believe them to be. We all know that children who are cherished and cared for, and who know they are, and have been told in so many ways—almost never "go wrong," and live up to all expectations.

I believe that the greatest security for children is first in the adults who surround them, and secondly in all the intangible, immaterial things we as adults provide for them, i.e., acceptance, approval, encouragement, love and giving. The only kind of giving children understand or accept is a giving of self—this means a giving of our time, our presence, our interest and our full attention. If we withhold these, I don't think it matters whatever else we give materially: all the money in the world, all the toys and most expensive gifts fail to register or make up for what is withheld.

I thought a great deal about what I might share with you all today, and I think these are four essential thoughts that I would like to leave with you.

1. First, I believe that we have a grand opportunity today—now—to create a new climate for our children based on our trust of each other. It is the joint and extended thinking of like minds—our minds and ideas—as we share our caring, love and safekeeping of all the children, as our own children. This requires a commitment from all of us to build a trust that is extended from the home, to the school to the neighborhood. It is only our thinking,

caring and support of each other first that will create this new safe climate, this trust in each other, to care for each other's children. It is only a feeling—but it is what makes a community safe.

2. Secondly, let us resolve our adult fears of each other, and our differences. If parents are the primary teachers, then teachers are the secondary parents. Nurturing is a joint adult responsibility, and nurturing does not end with infancy. Husky teenagers need it as much, if not more. Parents and teachers are an indissoluble partnership—their caring, love and trust is like a protective shield for the child at every age. The parent-child relationship, a natural one, is a loving one. The teacher-child relationship is a sacred one—both are like the two sides of a coin.
3. Thirdly, children are really mirror images of the adults who surround them and influence them—all their lives. We are their only role-models—each one of us—they will be no better and no worse than what we are, and what our expectations are of them. Children will live up to the least and the most of our expectations of them. Let us consciously try to have high and great expectations from them of all that is good in them—of all that we believe to be good and true. They cannot do it alone, but I believe they will not fail us. All children of all ages have two basic needs: adult supervision and adult direction.
4. Fourthly, community trust is something we have to build—I believe it is based on our collective caring, and "look-out" for children in the community so that the safeguarding of children is extended from the home and parents to the school and teacher, to the neighborhood and neighbors and friends. How can children remain unsupervised, unsafe, unprotected if we extend this umbrella of caring over their

heads?

It is this feeling that makes for our trust, our dependences on others for caring that which we hold most dear, and most precious."

Agoraphobia Clinic Opened at Sheppard Pratt

Douglas A. Hedlund, MD, Director of the Adult Outpatient Program at the Sheppard and Enoch Pratt Hospital, Towson, MD, has announced the opening of a Group Therapy Clinic for the treatment of Agoraphobia.

In modern terms, Agoraphobia is described as "fear of fear" and its symptoms frequently confine sufferers to their homes or other "places of safety." The new group therapy clinic is designed to help the agoraphobic find new ways of dealing with the anxieties and multiple phobias associated with this condition.

The 90-minute weekly sessions (from 6:30-8 PM) are under the direction of a professional therapist assisted by a co-therapist who is a recovered Agoraphobic with group therapy experience.

Groups are limited to eight, and all persons receive an interview evaluation by Dr. Hedlund prior to group assignment.

For an interview appointment or further information, please call Dr. Hedlund at (301) 823-8200, Ext. 585.

Dr. Van Metre Elected

Thomas E. Van Metre, Jr., MD, of Baltimore, was elected Treasurer of the Joint Council of Allergy and Immunology (JCAI) by its Board of Directors at a recent meeting in New Orleans. The JCAI serves as the socioeconomic arm of the four major national allergy organizations: the American Academy of Allergy, the American College of Allergists, the American Association for Clinical Immunology and Allergy and the American Association of Certified Allergists.

Dr. Van Metre is the President-elect of the American Academy of Allergy. He also is Associate Professor of Medicine and in charge of the allergy clinic at Johns Hopkins Hospital in Baltimore.

Dr. Michels Elected

Dr. Joseph T. Michels was elected President of the Mercy Hospital Medical Staff at its recent annual election meeting. An obstetrician/gynecologist, he previously served two years as Vice President of the Medical Staff.

Other officers elected were: **Dr. Franklin L. Angell**, Chief of Radiology, as Vice President and **Dr. Robert L. Doyle**, Head of the Division of Urology, as Secretary-Treasurer.

Dr. Michels is also President-Elect of the Maryland OB/GYN Society and is a member of the Baltimore City Medical Society, American Medical Association and Med-Chi.

DR. MICHELS

A Fellow in the American College of OB/GYN, Dr. Michels is a graduate of Mount St. Mary's College, Emmitsburg, MD. He received his Medical Degree from the University of Pennsylvania School of Medicine and served his internship and residency at Mercy Hospital.

Dr. Michels has been a member of the Mercy Medical Staff for 20 years and serves on the Medical Affairs Committee of the Board of Trustees. He also has served on other committees of the Medical Staff. He and his family reside in Homeland in Baltimore. □

Peritoneal Adhesions: Where Do We Stand? by Abdallah Alameddine, MD

Dr. Jerome D. Frank Receives 2nd Annual Blanche Ittleson Award from American Orthopsychiatric Association

Jerome D. Frank, MD, PhD, an eminent clinician and researcher in the behavioral sciences, has received the 2nd Annual Blanche Ittleson Lecture Award by the American Orthopsychiatric Association.

The award, the highest honor the Association can bestow, was presented Apr. 2nd during the AOA's 56th Annual Meeting at the Washington Hilton Hotel in Wash., DC. The title of Dr. Frank's award lecture was **Mental Health in a Fragmented Society—The Shattered Crystal Ball**.

Dr. Frank, Professor Emeritus at Johns Hopkins University, was honored for his lifetime devotion to observing and understanding the function of psychotherapy and developing ways it might serve a greater role in promoting health.

He is a past President of the American Psychopathological Association, and the Society for the Psychological Study of Social Issues and has served on the Board of Directors of the AOA.

Dr. Frank received both his PhD in psychology (1934) and MD (1939) from Harvard University. He received his psychiatric training at the Henry Phipps Psychiatric Clinic at Johns Hopkins Hospital, during 1940-43.

He is the author or co-author of more than 200 scientific articles. His latest books include **Effective Ingredients of Successful Psychotherapy**, New York: Brunner/Mazel, 1978 (with Rudolf Hoehn-Saric, Stanley D. Imber, Bernard L. Liberman, and Anthony Stone) and **Psychotherapy and the Human Predicament: A Psychosocial Approach**: Schocken Books, New York, 1978.

Blanche Ittleson was a New Yorker who spent her lifetime promoting the development of positive mental health programs, particularly on behalf of children. Her efforts played a large role in the development of the World Federation of Mental Health. The first

winner of the Ittleson Award, presented last year, was the late Margaret Mead.

The American Orthopsychiatric Association is a multidisciplinary organization seeking a collaborative approach to the promotion of mental health and the study of human development. □

Dr. Thweatt Named to Editorial Board

Dr. Venita Thweatt, Pediatric Consultant and Director of the Bureau of School Health of the Baltimore City Health Department was recently named to the Editorial Board of the **Journal of School Health**. Published by the American School Health Association, the **Journal** is a monthly magazine for health professionals, principals, teachers, health educators and the medical community.

Dr. Thweatt will review article related to the health of school-aged children being considered for publication in the **Journal**.

Dr. Thweatt received her MD degree from the University of North Carolina and the MPH degree from the Johns Hopkins University. She received specialty pediatric training at the Children's Hospital National Medical Center in Wash., DC. She is a member of the American Public Health Association and the American School Health Association. □

AN EXTENSION OF HOPE FOR THE ALCOHOLIC

HIDDEN BROOK BEL AIR

Established 1968

We are pleased to announce the opening of Hidden Brook at Warwick. This is a major new enlargement of our capacity for the treatment of alcoholics...an expansion of 20 additional beds to the 39 already at Bel Air. Beautifully situated on the waterfront of the Warwick River near Secretary, Maryland in Dorchester County...the total environment is peaceful and ideally conducive to rehabilitation. The program, philosophy and rates of Hidden Brook at Warwick will be identical and interchangeable in every respect with the program at Hidden Brook, Bel Air. Request our brochure. Write or phone for information.

Now, in addition HIDDEN BROOK at WARWICK

Important data on the pain of acute cystitis:

In 87% of patients studied (303 of 349), Azo Gantanol® reduced pain and/or burning within 24 hours*

A controlled, multicenter study assessed the efficacy of Azo Gantanol in relieving pain and/or burning associated with acute urinary tract infection in patients with at least 100,000 colonies per ml of a sulfonamide-sensitive organism, usually *E. coli*. In 87% of patients with initial symptoms rated "moderate to severe," Azo Gantanol therapy resulted in improvement within 24 hours.

Fast pain relief plus effective antibacterial action

Azo Gantanol®

Each tablet contains 0.5 Gm sulfamethoxazole and 100 mg phenazopyridine HCl.

for
the pain

for
the pathogens

Data on file, Hoffmann-La Roche Inc., Nutley, New Jersey 07110.

Before prescribing, please consult complete product information, a summary of which follows:
Indications: In adults, urinary tract infections complicated by pain (primarily pyelonephritis, pyelitis and cystitis) due to susceptible organisms (usually *E. coli*, *Klebsiella-Aerobacter*, *Staphylococcus aureus*, *Proteus mirabilis*, and, less frequently, *Proteus vulgaris*) in the absence of obstructive uropathy or foreign bodies. **Note:** Carefully coordinate *in vitro* sulfonamide sensitivity tests with bacteriologic and clinical response; add aminobenzoic acid to follow-up culture media. The increasing frequency of resistant organisms limits the usefulness of antibacterials including sulfonamides. Measure sulfonamide blood levels as variations may occur; 20 mg/100 ml should be maximum total level.

Contraindications: Children below age 12; sulfonamide hypersensitivity; pregnancy at term and during nursing period; because Azo Gantanol contains phenazopyridine hydrochloride it is contraindicated in glomerulonephritis, severe hepatitis, uremia, and pyelonephritis of pregnancy with G.I. disturbances.

Warnings: Safety during pregnancy not established. Deaths from hypersensitivity reactions, agranulocytosis, aplastic anemia and other blood dyscrasias have been reported and early clinical signs (sore throat, fever, pallor, purpura or jaundice) may indicate serious blood disorders. Frequent CBC and urinalysis with microscopic examination are recommended during sulfonamide therapy.

Precautions: Use cautiously in patients with impaired renal or hepatic function, severe allergy, bronchial asthma; in glucose-6-phosphate dehydrogenase-deficient individuals in whom dose-related hemolysis may occur. Maintain adequate fluid intake to prevent crystalluria and stone formation.

Adverse Reactions: *Blood dyscrasias* (agranulocytosis, aplastic anemia, thrombocytopenia, leukopenia, hemolytic anemia, purpura, hypoprothrombinemia and methemoglobinemia); *allergic reactions* (erythema multiforme, skin eruptions, Stevens-Johnson syndrome, epidermal necrolysis, urticaria, serum sickness, pruritus, exfoliative dermatitis, anaphylactoid reactions, periorbital edema, conjunctival and scleral injection, photosensitization, arthralgia and allergic myocarditis); *G.I. reactions* (nausea, emesis, abdominal pains, hepatitis, diarrhea, anorexia, pancreatitis and stomatitis); *CNS reactions* (headache, peripheral neuritis, mental depression, convulsions, ataxia, hallucinations, tinnitus, vertigo and insomnia); *miscellaneous reactions* (drug fever, chills, toxic nephrosis with oliguria and anuria, periarteritis nodosa and L. E. phenomenon). Due to certain chemical similarities with some goitrogens, diuretics (acetazolamide, thiazides) and oral hypoglycemic agents, sulfonamides have caused rare instances of goiter production, diuresis and hypoglycemia. Cross-sensitivity with these agents may exist.

Dosage: Azo Gantanol is intended for the acute, painful phase of urinary tract infections. *Usual adult dosage:* 2 Gm (4 tabs) initially, then 1 Gm (2 tabs) B.I.D. for up to 3 days. If pain persists, causes other than infection should be sought. After relief of pain has been obtained, continued treatment with Gantanol (sulfamethoxazole) may be considered.

NOTE: Patients should be told that the orange-red dye (phenazopyridine HCl) will color the urine.

Supplied: Tablets, red, film-coated, each containing 0.5 Gm sulfamethoxazole and 100 mg phenazopyridine HCl—bottles of 100 and 500.

ROCHE

Roche Laboratories
Division of Hoffmann-La Roche Inc.
Nutley, New Jersey 07110

A reminder

ZYLOPRIM[®]

(allopurinol)

100 and 300 mg scored Tablets

- inhibits uric acid formation
- helps prevent urate crystal depositions in synovia
- reduces risk of uric acid lithiasis

INDICATIONS AND USE: This is not an innocuous drug and strict attention should be given to the indications for its use. Pending further investigation, its use in other hyperuricemic states is not indicated at this time.

Zyloprim[®] (allopurinol) is intended for:

1. treatment of gout, either primary, or secondary to the hyperuricemia associated with blood dyscrasias and their therapy;
2. treatment of primary or secondary uric acid nephropathy, with or without accompanying symptoms of gout;
3. treatment of patients with recurrent uric acid stone formation;
4. prophylactic treatment to prevent tissue urate deposition, renal calculi, or uric acid nephropathy in patients with leukemias, lymphomas and malignancies who are receiving cancer chemotherapy with its resultant elevating effect on serum uric acid levels.

CONTRAINDICATIONS: Use in children with the exception of those with hyperuricemia secondary to malignancy. The drug should not be employed in nursing mothers.

Patients who have developed a severe reaction to Zyloprim should not be restarted on the drug.

WARNINGS: ZYLOPRIM SHOULD BE DISCONTINUED AT THE FIRST APPEARANCE OF SKIN RASH OR ANY SIGN OF ADVERSE REACTION. In some instances a skin rash may be followed by more severe hypersensitivity reactions such as exfoliative, urticarial and purpuric lesions as well as Stevens-Johnson syndrome (erythema multiforme) and very rarely a generalized vasculitis which may lead to irreversible hepatotoxicity and death.

A few cases of reversible clinical hepatotoxicity have been noted and in some patients asymptomatic rises in serum alkaline phosphatase or serum transaminase have been observed. Accordingly, periodic liver function tests should be performed during the early stages of therapy, particularly in patients with pre-existing liver disease. Patients should be alerted to the need for due precautions when engaging in activities where alertness is mandatory.

Nevertheless, iron salts should not be given simultaneously with Zyloprim. This drug should not be administered to immediate relatives of patients with idiopathic hemochromatosis.

In patients receiving Purlinethol[®] (mercaptapurine) or Imuran[®] (azathioprine), the concomitant administration of 300-600 mg of Zyloprim per day will require a reduction in dose to approximately one-third to one-fourth of the usual dose of mercaptapurine or azathioprine. Subsequent adjustment of doses of Purlinethol or Imuran should be made on the basis of therapeutic response and any toxic effects.

Usage in Pregnancy and Women of Childbearing Age: Zyloprim[®] (allopurinol) should be used in pregnant women or women of childbearing age only if the potential benefits to the patient are weighed against the possible risk to the fetus.

PRECAUTIONS: Some investigators have reported an increase in acute attacks of gout during the early stages of allopurinol administration, even when normal or sub-normal serum uric acid levels have been attained.

It has been reported that allopurinol prolongs the half-life of the anticoagulant, dicumarol. This interaction should be kept in mind when allopurinol is given to patients already on anticoagulant therapy, and the coagulation time should be reassessed.

A fluid intake sufficient to yield a daily urinary output of at least 2 liters and the maintenance of a neutral or, preferably, slightly alkaline urine are desirable to (1) avoid the theoretic possibility of formation of xanthine calculi under the influence of Zyloprim therapy and (2) help prevent renal precipitation of urates in patients receiving concomitant uricosuric agents.

Patients with impaired renal function require less drug and should be carefully observed during the early stages of Zyloprim administration and the drug withdrawn if increased abnormalities in renal function appear.

In patients with severely impaired renal function, or decreased urate clearance, the half-life of oxipurinol in the plasma is greatly prolonged. Therefore, a dose of 100 mg per day or 300 mg twice a week, or perhaps less, may be sufficient to maintain adequate xanthine oxidase inhibition to reduce serum urate levels. Such patients should be treated with the lowest effective dose, in order to minimize side effects.

Mild reticulocytosis has appeared in some patients.

As with all new agents, periodic determination of liver and kidney function and complete blood counts should be performed especially during the first few months of therapy.

ADVERSE REACTIONS:

Dermatologic: Because in some instances skin rash has been followed by severe hypersensitivity reactions, it is recommended that therapy be discontinued at the first sign of rash or other adverse reaction (see WARNINGS). Skin rash, usually maculopapular, is the adverse reaction most commonly reported.

Exfoliative, urticarial and purpuric lesions, Stevens-Johnson syndrome (erythema multiforme) and toxic epidermal necrolysis have also been reported.

A few cases of alopecia with and without accompanying dermatitis have been reported.

In some patients with a rash, restarting Zyloprim (allopurinol) therapy at lower doses has been accomplished without untoward incident.

Gastrointestinal: Nausea, vomiting, diarrhea, and intermittent abdominal pain have been reported.

Vascular: There have been rare instances of a generalized hypersensitivity vasculitis or necrotizing angitis which have led to irreversible hepatotoxicity and death.

Hematopoietic: Agranulocytosis, anemia, aplastic anemia, bone marrow depression, leukopenia, pancytopenia and thrombocytopenia have been reported in patients, most of whom received concomitant drugs with potential for causing these reactions. Zyloprim[®] (allopurinol) has been neither implicated nor excluded as a cause of these reactions.

Neurologic: There have been a few reports of peripheral neuritis occurring while patients were taking Zyloprim. Drowsiness has also been reported in a few patients.

Ophthalmic: There have been a few reports of cataracts found in patients receiving Zyloprim. It is not known if the cataracts predated the Zyloprim therapy. "Toxic" cataracts were reported in one patient who also received an anti-inflammatory agent; again, the time of onset is unknown. In a group of patients followed by Gutman and Yü for up to five years on Zyloprim therapy, no evidence of ophthalmologic effect attributable to Zyloprim was reported.

Drug Idiosyncrasy: Symptoms suggestive of drug idiosyncrasy have been reported in a few patients. This was characterized by fever, chills, leukopenia or leukocytosis, eosinophilia, arthralgias, skin rash, pruritus, nausea and vomiting.

OVERDOSAGE: Massive overdosing, or acute poisoning, by Zyloprim has not been reported.

HOW SUPPLIED: 100 mg (white) scored tablets, bottles of 100 and 1000; 300 mg (peach) scored tablets, bottles of 30, 100 and 500. Unit dose packs for each strength also available.

Complete information available from your local B. W. Co. Representative or from Professional Services Department PML.

U.S. Patent No. 3,624,205 (Use Patent)

Burroughs Wellcome Co.
Research Triangle Park
North Carolina 27709

COMPATIBILITY

Does it influence your choice of a peripheral/cerebral vasodilator*?

- Vasodilan—compatible with coexisting diseases
- Vasodilan—compatible with concomitant therapy
- Vasodilan—compatible with your total regimen for vascular insufficiency

***Indications:** Based on a review of this drug by the National Academy of Sciences-National Research Council and/or other information, the FDA has classified the indications as follows:

Possibly Effective:

1. For the relief of symptoms associated with cerebral vascular insufficiency.
2. In peripheral vascular disease of arteriosclerosis obliterans, thromboangiitis obliterans (Buerger's Disease) and Raynaud's disease.

Final classification of the less-than-effective indications requires further investigation.

Composition: Vasodilan tablets, isoxsuprine HCl, 10 mg. and 20 mg. Vasodilan injection, isoxsuprine HCl, 5 mg., per ml.

Dosage and Administration: Oral: 10 to 20 mg., three or four times daily. Intramuscular: 5 to 10 mg. (1 or 2 ml.) two or three times daily. Intramuscular administration may be used initially in severe or acute conditions.

Contraindications and Cautions: There are no known contraindications to oral use when administered in recommended doses. Should not be given immediately postpartum or in the presence of arterial bleeding.

Parenteral administration is not recommended in the presence of hypotension or tachycardia.

Intravenous administration should not be given because of increased likelihood of side effects.

Adverse Reactions: On rare occasions oral administration of the drug has been associated in time with the occurrence of hypotension, tachycardia, nausea, vomiting, dizziness, abdominal distress, and severe rash. If rash appears the drug should be discontinued.

Although available evidence suggests a temporal association of these reactions with isoxsuprine, a causal relationship can be neither confirmed nor refuted.

Administration of single dose of 10 mg. intramuscularly may result in hypotension and tachycardia. These symptoms are more pronounced in higher doses. For these reasons single intramuscular doses exceeding 10 mg. are not recommended. Repeated administration of 5 to 10 mg. intramuscularly at suitable intervals may be employed.

Supplied: Tablets, 10 mg., bottles of 100, 1000, 5000 and Unit Dose; Tablets, 20 mg., bottles of 100, 500, 1000, 5000 and Unit Dose; Injection, 10 mg. per 2 ml. ampul, box of six 2 ml. ampuls.

**When painful spasm
is the presenting
symptom...**

...in the functional bowel/irritable bowel syndrome*

Bentyl[®]

(dicyclomine hydrochloride USP)

10 mg. capsules, 20 mg. tablets,
10 mg./5 ml. syrup, 10 mg./ml. injection

helps control abnormal motor activity
with minimal anticholinergic side effects†

Demonstrated smooth muscle relaxant activity.

In this double-blind study, twenty patients having G.I. series and exhibiting spasm were randomly selected to receive either 2 cc. of Bentyl or sodium chloride intramuscularly. Ten minutes after the injection another radiograph was taken . . .

. . . Bentyl produced definite relaxation in 8 of 10 patients. The sodium chloride produced relaxation in only 3 of 10. No side effects occurred in either group of patients.

Pylorospasm has almost totally blocked passage of barium meal.

Barium meal beginning to pass 10 minutes after intramuscular injection of 20 mg. Bentyl.

"The correlation of spasm relief and drug given was excellent."

*This drug has been classified "probably" effective in treating functional bowel/irritable bowel syndrome

Merrell

Bentyl® (dicyclomine hydrochloride USP)

Capsules, Tablets, Syrup, Injection

AVAILABLE ONLY ON PRESCRIPTION

Brief Summary

INDICATIONS

Based on a review of this drug by the National Academy of Sciences—National Research Council and/or other information, FDA has classified the following indications as "probably" effective:

For the treatment of functional bowel/irritable bowel syndrome (irritable colon, spastic colon, mucous colitis) and acute enterocolitis.

THESE FUNCTIONAL DISORDERS ARE OFTEN RELIEVED BY VARYING COMBINATIONS OF SEDATIVE, REASSURANCE, PHYSICIAN INTEREST, AMELIORATION OF ENVIRONMENTAL FACTORS.

For use in the treatment of infant colic (Syrup).

Final classification of the less-than-effective indications requires further investigation.

CONTRAINDICATIONS: Obstructive uropathy (for example, bladder neck obstruction due to prostatic hypertrophy); obstructive disease of the gastrointestinal tract (as in achalasia, pyloroduodenal stenosis); paralytic ileus, intestinal atony of the elderly or debilitated patient; unstable cardiovascular status in acute hemorrhage; severe ulcerative colitis; toxic megacolon complicating ulcerative colitis; myasthenia gravis. **WARNINGS:** In the presence of a high environmental temperature, heat prostration can occur with drug use (fever and heat stroke due to decreased sweating). Diarrhea may be an early symptom of incomplete intestinal obstruction, especially in patients with ileostomy or colostomy. In this instance treatment with this drug would be inappropriate and possibly harmful. Bentyl may produce drowsiness or blurred vision. In this event, the patient should be warned not to engage in activities requiring mental alertness such as operating a motor vehicle or other machinery or perform hazardous work while taking this drug. **PRECAUTIONS:** Although studies have failed to demonstrate adverse effects of dicyclomine hydrochloride in glaucoma or in patients with prostatic hypertrophy, it should be prescribed with caution in patients known to have or suspected of having glaucoma or prostatic hypertrophy. Use with caution in patients with: Autonomic neuropathy. Hepatic or renal disease. Ulcerative colitis. Large doses may suppress intestinal motility to the point of producing a paralytic ileus and the use of this drug may precipitate or aggravate the serious complication of toxic megacolon. Hyperthyroidism, coronary heart disease, congestive heart failure, cardiac arrhythmias, and hypertension. Hiatal hernia associated with reflux esophagitis since anticholinergic drugs may aggravate this condition.

Do not rely on the use of the drug in the presence of complication of biliary tract disease. Investigate any tachycardia before giving anticholinergic (atropine-like) drugs since they may increase the heart rate. With overdosage, a curare-like action may occur. **ADVERSE REACTIONS:** Anticholinergics/antispasmodics produce certain effects which may be physiologic or toxic depending upon the individual patient's response. The physician must delineate these. Adverse reactions may include xerostomia, urinary hesitancy and retention; blurred vision and tachycardia; palpitations; mydriasis; cycloplegia; increased ocular tension; loss of taste; headache; nervousness; drowsiness; weakness; dizziness; insomnia; nausea; vomiting; impotence; suppression of lactation; constipation; bloated feeling; severe allergic reaction or drug idiosyncrasies including anaphylaxis; urticaria and other dermal manifestations; some degree of mental confusion and/or excitement, especially in elderly persons; and decreased sweating. With the injectable form there may be a temporary sensation of lightheadedness and occasionally local irritation. **DOSAGE AND ADMINISTRATION:** Dosage must be adjusted to individual patient's needs.

Usual Dosage: Bentyl 10 mg. capsule and syrup: *Adults:* 1 or 2 capsules or teaspoonfuls syrup three or four times daily. *Children:* 1 capsule or teaspoonful syrup three or four times daily. *Infants:* ½ teaspoonful syrup three or four times daily. (May be diluted with equal volume of water.) Bentyl 20 mg.: *Adults:* 1 tablet three or four times daily. Bentyl Injection: *Adults:* 2 ml. (20 mg.) every four to six hours intramuscularly only. **NOT FOR INTRAVENOUS USE. MANAGEMENT OF OVERDOSE:** The signs and symptoms of overdose are headache, nausea, vomiting, blurred vision, dilated pupils, hot, dry skin, dizziness, dryness of the mouth, difficulty in swallowing, CNS stimulation. Treatment should consist of gastric lavage, emetics, and activated charcoal. Barbiturates may be used either orally or intramuscularly for sedation but they should not be used if Bentyl with Phenobarbital has been ingested. If indicated, parenteral cholinergic agents such as Urecholine® (bethanechol chloride USP) should be used.

Product Information as of October, 1978.

Vocational Education Program for Adolescents with Epilepsy

Epilepsy is a major developmental disability affecting approximately five of every 1,000 school children. Often it exists with other impairments such as neurological problems, learning and psychological difficulties. Quite often the adolescent with epilepsy is faced with many obstacles to overcome in the adjustment to the disability personally, vocationally and socially. Experience suggests that early intervention is necessary in order to attend to these special needs.

Studies have shown that if a person with epilepsy finishes or drops out of school and is not employed within two years, the probability is that they will never be employed. This teenage period is critical for the acquisition of skills and attitudes and for the establishment of psychological confidence and independence necessary for their development into productive members of the community.

A Supportive Special/Vocational Services Program has been established for students with seizure disorders who are potential vocational education students or those already enrolled in vocational education programs. Its purpose is to improve the opportunities for people with epilepsy and to assist them in preparing for employment.

A coordinated community effort has been undertaken by these agencies: Maryland State Department of Education, Division of Vocational-Technical Education, Division of Vocational Rehabilitation, Region III Baltimore City Educational Unit, Maryland Rehabilitation Center, Baltimore City Public Schools, Division for Exceptional Children, Division of Vocational Education, Johns Hopkins Hospital, John F. Kennedy Institute and Mayor's Office of Manpower Resources.

Membership on the committee providing the general direction of the program is continually expanding to insure efficient use of existing community resources.

The goals of the program are:

To identify students with epilepsy within the schools.

To assess students' needs, aptitudes, interests and goals.

To place students in appropriate job-training programs

To improve medical control of seizures

To increase family involvement and provide family counseling where necessary

To provide individual and group counseling to improve student's attitudes toward themselves and their jobs

To train teachers, nurses, counselors and employers to deal with students who have epilepsy.

To assist students to get and keep appropriate long-term employment.

The major components of the project include:

1. Formal and informal evaluations, including some at the Maryland Rehabilitation Center to determine necessary services

2. Counselors to assist with personal, family, social and vocational adjustment

3. Instruction in job-seeking skills and follow-along assistance on the job

4. An employer committee to create jobs and to formulate new techniques for increasing successful job placement.

5. Assistance toward better seizure control.

The Therapist's Use of Self-Disclosure in Counseling and Psychotherapy: Implications and Considerations For Its Use

By PETER J. POCILUYKO

Mr. Pociluyko is Senior Counselor of the Carroll County Alcoholism Clinic at 540 Washington Rd., PO Box 845, Westminster, MD 21157.

Introduction

The professional distance which sometimes characterizes the physician-patient relationship can be an obstacle in working with the alcoholics. Usually willing to discuss almost anything with his physician except an honest appraisal of his drinking problem, the alcoholic is basically an isolated person walled off by a well-built denial system.

Sometimes self-disclosure by the physician is required before the alcoholic will begin to honestly disclose the role of alcohol in his problem.

The ability and willingness to allow another individual to experience you as you are is perhaps not only a personal choice but also a necessary one. "When a man does not allow or acknowledge to himself who, what and how he is, he is out of touch with reality and himself; consequently, he will sick-en physically, psychologically and/or spiritually. No one can help him without access to the facts and it seems to be another fact that no man can come to know himself except as an outcome of periodically disclosing himself to another person."¹

Upon encountering another individual, we generally begin by seeking knowledge of that person, but we also attempt to allow the other person to know us. This is generally the only way we can co-exist with the inevitable, existential loneliness and separateness that is true of all people. We as people

are all individuals, but it is also our nature to be social; therefore, it is inevitable for all of us to make ourselves known to others, in order to continue to survive and remain healthy.

When we speak of disclosure, we tend to disclose our emotions, opinions, fantasies, dreams and our perceptions, often in explicit, but more often in implicit, ways. "When a man discloses his experience to another, fully, spontaneously and honestly, then the mystery that he was decreases."² Therefore, it seems that to constantly withhold experience or knowledge, can mean that one is maintaining or even complicating the mystery of himself. This is an important point, because we as a culture tend to identify ourselves as a society bent on seeking truth, yet, it is the normality of this culture to hide our feelings, particularly our feelings of anger, because we view these inner experiences as destructive, useless and not socially acceptable. The trap we have fallen into is to view this normal behavior as being healthy, when in fact, it may be pathological (the pathology of normality.³) This constant mystery and denial to one's self and to others, can lead to estrangements from one's true self, often resulting in neurotic or psychotic behavior, depression, suicidal ideations or attempts and in general feeling of meaninglessness in life.

However, this is not a paper looking so much at emotional disturbances due to one's lack of openness and honesty, but rather how those of us who are employed in the helping professions must examine the impact of self-disclosure

in a therapeutic situation. Specifically, I will address self-disclosure, special considerations and implications of its use, and in particular, what the effects of not disclosing ourselves (in a therapeutic situation) may have on our clients.

Let us begin by first examining the given points in all interactional situations. The first point that is not, is that there is no such thing as non-behavior, or put more simply, "One cannot not behave."⁴ If it is also accepted that all behavior in an interactional situation has a message of value, in effect is communication, then it follows that no matter how we try, one cannot not communicate.⁵ Activity, inactivity, words or silence, all have message value; they influence other people and these other individuals, cannot not respond to these communications and are themselves communicating.⁶ Therefore, even if we do not openly verbalize our feelings, thoughts, opinions or values, our behavior nonetheless will communicate these experiences through our non-verbal behavior. This will always hold true, even if we deny the existence of certain inner experiences.

The attempt not to communicate is often the dilemma of schizophrenic individuals, as expressed by their cryptic language, nonsense, silence, withdrawal or any other form of denial.⁷ This behavior is nonetheless communication, leaving these individuals with the impossible task of denying that he is communicating and, at the same time, denying that his denial is a communication.⁸ Communication also implies commitment and thereby defines the sender's view of his rela-

tionship with the receiver; to deny communication is to try to avoid commitment by not communicating.⁹

Let us now move to examining the traditional psychotherapeutic approaches. Upon consulting a professional therapist, the client is usually encouraged to begin by telling all he can about himself, while the therapist listens. This is generally fundamental to all types of psychotherapy, including group or family treatment. It is usually understood by the client that if he reveals himself to the therapist, the therapist will be better able to understand him and to help him change. At this point, a therapist often will sit back, observe and listen. Usually, he will not introject much, if any, of his own thoughts, feelings, conceptions or inner experiences.

In traditional psychoanalytic treatment or psychoanalytically-based psychotherapy, the therapist is allowing a transference to develop, whereby the client projects his distorted conceptions and attitudes of significant others onto the therapist. These conceptions and attitudes may later be analyzed and worked through in long-term treatment, the belief also being that a therapist should not interfere with the developing transference and should not introject his conceptions or experiences into the developing transference (so that the transference is not distorted); yet, we have a paradox in that we cannot not communicate (feelings, values, ideas, thoughts, etc.) and if we deny, refuse to admit or comment on (often by reflective technique) our inner experiences, we are still having a tremendous impact on the client's conception and the developing transference. We often, in fact, (whether we try to or not) are affecting the outcome of the transference; and usually by our subtle cues, (which are sensed by our clients) we are determining the outcome of the transference. In effect, if a therapist expects (consciously or preconsciously) certain types of dreams, conceptions, ideas and feelings, the client will generally begin to have those types of experiences to accommodate the therapist's ex-

pectations. (I would speculate that therapists with low senses of self-esteem or self-concept will generally have more patients reacting in an attempt to please the therapist and make him feel competent; this may be particularly true if psychotherapeutic work is being done with schizophrenic and alcoholic individuals who are extremely adept at seeing our unconscious processes, often better than we are ourselves).

As noted earlier, it has long been believed, in many areas of the helping professions, that a therapist should not interfere with a client's transference or his conceptions projected onto the therapists. In particular, it is felt for a therapist to reveal his personal reactions, feelings, opinions or values, is tantamount to "psychotherapeutic heresy and is interfering with the client's therapy. However, what is not taken into account is that these unexpressed experiences of the therapist (both healthy and pathological) are still being communicated and are being assimilated by the client. Perhaps now, self-disclosure must be looked at as an additional factor, (not exclusive of factors such as empathy, acceptance, insights, interpretation or reframing of behavior) as a useful skill and quality of an effective helping professional in his attempt to assist people to become more independent, stable and healthy.

At times, clients may ask for our reactions which they often have a feeling for long before we give them, by our facial expressions, voice tone and our general overall behavior. What becomes most serious is that if we deny openly to the client (and to ourselves) certain inner experiences, we are "mystifying the experience of the other person."¹⁰ The individual is perceiving one experience through our behavior, is reacting to or commenting on his conception of this experience, but by our denial is implicitly being told that his conceptions are inaccurate. The result may be growing frustration, hostility and confusion, which may sometimes be indicative by sudden relapses and/or a client's premature stopping treatment.

What we are often addressing

here is the therapist's anxiety, not only about self-disclosure, but to "Protect himself from the odious charge of being human—of faltering, in short, of being anything less than God-like."¹¹ There may be the fear that if he reveals his humanness, his technique will be unmasked and that without his technique, he will lack identity. It is a moot point, to note that this anxiety and concern of the therapist will be communicated to the client who, in effect, will also become anxious. Fromm-Reichman¹² has vividly remarked on this when she addresses the importance of the therapist to openly admit mistakes, misunderstandings and potential contrasts in the personalities (of both client and therapist) with any patient; "This can only be accomplished by a psychiatrist or therapist reasonably secure within himself." (This is not a new concept, but was written by a psychoanalytically-trained psychiatrist over 30 years ago; it also shows a rare courage and willingness to look at one's self.)

Too often in their training health professionals—especially mental health professionals—lose their natural and innate qualities for working with people and begin to assume a mask-like quality, because they think this is the professional, expected thing to do.¹³ At these extreme levels, professionals begin to "play act" a role, in effect allowing the role to totally rule their behavior, versus their "assuming" a professional role in that they will allow expression of their human reactions, monitor these reactions and still maintain their therapeutic technique. The paradox is that the therapist's denial and suppression of his human qualities is diametrically opposed to teaching the client how to develop this healthy spontaneity in himself, the absence of which has led to the client's psychological and physical problems.

Jourard,¹⁴ in his clinical work has related how in numerous situations he found that expressing his personal reactions or experience often began leading to breakthroughs in therapy with clients. He found his theory and therapeutic

tic technique still valuable foundations and tools, but he refused to allow his true reactions to always be stifled by "proper technique." He continued to research this phenomena, and found that when an interviewer was willing to reveal information about himself, the interviewees tended to disclose more information about themselves, usually matching the amount of disclosure made by the interviewer. This was in contrast to a totally non-disclosing interviewer who was unable to obtain as much information about an interviewee. Jourard¹⁵ also found that when using a strict reflective technique (the interviewer refusing to disclose himself and always restating questions and statements of the client), the interviewee would strictly maintain themselves to negative self-references. This was in contrast that when an interviewer was more open and self-disclosing, the clients tended to examine both the positive and negative references about self, rather than strictly looking at themselves in a negative manner. (Reflection is still a valuable tool, and is useful in communicating to the client that we heard what he said and allowing the client to hear what he has just told us; however, it should not be our only skill.)

Research by Carknuff and Berenson¹⁶ showed the characteristics of effective helpers consistently included the ability to self-disclose and an ability to use confrontation. Confrontation can be seen as a higher form of self-disclosure—since it involves the therapist investing personal risk. Their research showed that effective therapists willingly went with their empathic conceptions and would challenge a client's distorted perceptions and the clients' incongruencies with regards to his feelings and behavior. It was noted that if a client's distortions and incongruencies were not challenged, it generally meant there was no further growth for the client. This work and that of Jourard leads to my belief that self-disclosure (and confrontation) may have a profound effect on a client's concept of himself, particularly with regard to his/her ability to see both posi-

tive and negative aspects of himself; giving rise to change and growth.

It seems too often therapists place too much emphasis and fascination on understanding psychopathology and do not assist the client in examining or identifying his strengths. This is often manifested if a client is constantly looking for difficulties and problems to be solved rather than looking at the progress and strengths he possesses. (I also suspect many effective therapists can redefine "illogical" disturbed behavior in terms of its logic, and can often relabel that behavior in terms of the individual's attempt to cope in a more healthy way.)

From my overall experience and belief, I have come to view self-disclosure as necessary and useful with regard to individual and family group treatment. Often when working with individual clients, particularly Parole and Probation referrals, various forms of self-disclosure about myself or my background consistently has effected the amount of information I would receive from new clients. It was my experience prior to using self-disclosure on initial interviews that clients would remain resistant and hesitant to disclose any information about themselves. Usually, they would verbally communicate in vague and general terms when specific questions about them or their histories were asked. I have also found this to be especially true when seeing individual adolescents, particularly if they are coming under duress. At times, with "resistant" clients, I have been willing to match any disclosure made on their part with an equal revelation of myself. This has sometimes lead to dramatic movements with regard to the individuals beginning to examine his/her life difficulties and his/her problematic relationship with alcohol.

I have also found that it is sometimes useful to meta-communicate (or meta-disclose), in effect comment on or make a disclosure about a disclosure to a client. There have been situations, where after having expressed annoyance or anger at a particular client, I realized my feelings were somewhat unjustified and defensive, I have found it useful to openly state that my reaction was

in error. I feel that this gives a client a model for which to imitate (in that he can question himself, check his feelings out with himself) and also gives him a sense that the therapist is not an "omnipotent god." In other situations, I will often openly laugh about a particular point a client is making, revealing parts of my humanness. This again tends to set a model for the client to follow, in that the therapist is more willing to show his human side.

In some situations, after treatment has begun and gone on for a period of time, I have found it especially useful to share a past experience which may be similar to the difficulty a particular client is experiencing. I may or may not comment on whether the particular problem was resolved for myself, depending on the situation. In general, if a particular shared concern was resolved for myself, this often may instill a hope of recovery in the client. Even if a particular concern that I disclose has not been resolved, this implicitly communicates to the client that my life is not devastated by not having solved some difficulties, and suggests that the client's life may also not be in jeopardy if his particular situation is not quickly resolved. This may also allow the individual to set priorities about what difficulties he wishes to exert more energy on, versus other problems that may not be able to be resolved or may take more time.

With groups, particularly with groups of adolescents and adult alcoholics, I have found that opening sessions were often easier when I or my co-leader would begin by disclosing our feelings at the beginning of the session. At other times, we have begun sessions by perhaps disclosing something light about our personal life, that was not overwhelming or too deeply personal. We would then ask what other group members felt or were experiencing. It has consistently been my experience, that individuals or groups will not ask for more personal information (as is feared by many therapists if they begin to disclose themselves), but will begin to initiate their own disclosure and

begin working on their difficulties much sooner. At later points during a session, I will often re-disclose my feelings or conceptions, about how the group is working; feelings about how a person's specific behavior is effecting me and that I am curious if it is effecting other group members in the same manner. At other times throughout the session, direct interpretation of group process or behavior may also be used in combination with self-disclosures. It has generally been my experience that individuals or groups will tend to model the role of the therapist, and if he is "tight-lipped," clients will be also.

When using self-disclosure (or confrontation), special considerations should be observed. Self-disclosure involves the therapist being sensitive to his own inner experiences, in conjunction with his willingness to admit these experiences to himself; he need not always disclose these specific experiences to the client. It is only important that he recognize them and not deny them to himself. I note this in particular because many times disclosure is not useful unless properly timed when a client may be most ready to hear it. This, for me, has generally only been learned through experience, the development and sensitivity to individual people and group process (also having good consultation.)

As a model for using self-disclosure, these rules may prove helpful. It is useful to identify; and comment on how such behavior leaves you feeling and your feelings about specific behavior when using self-disclosure. This will generally tend to minimize the possibility of "dumping on" or attacking another individual, in contrast to challenging a specific unhealthy behavior, which is somewhat separate from their essence as people. It may also be useful at times to ask a client if he is interested in our reactions or our conceptions about him/her, as a way to "open the door" of self-disclosure. An additional important point is that when using disclosure there is a point at which an effective therapist can "reach down inside himself" and determine whether this feels to be

an appropriate move on his part. This is noted because disclosure is given for the benefit of the client (though it may also benefit the therapist), and it is not simply for the therapist to ventilate his opinions or feelings. An additional side-light may be that disclosure need not always be limited to personal information, but may also involve a therapist being clear about his agency's specific policies. For example, when referrals are received from the Department of Parole and Probation, often clients wish to know exactly what information will be shared with the courts; and here it is wise for an agency to have, in very explicit terms, what information is valuable for treatment, what is not and what specific information the courts need. Often until clients know these things, they will generally resist talking about themselves and, unfortunately (due to unclear policy about information released in some agencies), are many times referred back to Parole and Probation as being "resistant and hostile" towards treatment.

When using self-disclosure or confrontation, there are additional considerations that must be examined. It must be remembered that transference and parataxic distortions do exist in interactional situations. Many individuals or members of groups may have an initial need to see a therapist as the "all together type of individual," who doesn't possess any problems or may need to see the therapist in another specific way. In opening sessions, it may be wise with some individuals to limit disclosure and respond with social graces. An additional fallacy is that one needs to be completely and openly disclosing at all times. This is generally harmful to the client. I feel that unlimited self-disclosure can be equally as destructive and purposelessness as the attempt not to reveal or disclose any part of ourselves. Any mandate which limits the therapist's flexibility renders him less effective. I have seen some therapists hobbled by a conviction that they must, at all times, be totally honest and transparent and others by the dictum that they must only make

pretations or, even worse, make only mass group transference interpretations.¹⁷ There appears to be some definite need for balance between the use of transference, analysis of that transference and distortion and the use of personal disclosure by the therapist.

Self-disclosure perhaps also needs to be examined in other settings. Kubler-Ross¹⁸ has addressed the problem of dying patients in hospital settings. More often than not, she has found that staff will begin to avoid patients or will put on an air of being happy, trying to avoid any discussion of death or terminal illness. Unfortunately, the patient is the first to notice this change of behavior, realizes that something is wrong and is not being stated, and becomes increasingly anxious waiting for someone to be "upfront." At other times, the patients may not be told what the status of their case is, but their family has been. This also may lead to an uneasy facade which is demonstrated before them, increasing their anger, guilt and anxiety. Kubler-Ross has found that these feelings will quickly subside when staff or family begin to openly acknowledge to each other and to the patient what the status of that person's well-being is.

Jourard¹⁹ has also commented on the role of doctors and nurses who, in their training, are taught to put on a professional mask. The purpose of this mask is to avoid admitting feelings of anger, shame or disgust in front of patients. It also serves to avoid any emotional involvement in the patient's life, the result being that the patient suffers. The style of patient treatment is usually not something which is explicitly taught student doctors and nurses, but is something implicitly learned from their supervisors. Unfortunately, Jourard feels that unspoken experiences that staff have often are expressed to the patient by the staff's abruptness, sharpness and emotional detachment. He feels this may sometimes result in what he calls "The loss of inspiration to becoming well,"²⁰ in essence the individual fails or is slow in recovering from his physical illness because he is beginning to feel

he is being treated like an object.

In psychiatric settings, Stanton and Schwartz,²¹ Kilgalen and Schulz²² and Fry,²³ have all discussed what happens when staff are strongly disagreeing on any level, about any issue, but fail to openly acknowledge their disagreement or feelings of disagreement. More often than not staff may be covertly disagreeing about patient treatment or responsibilities a patient should have. Staff may instead pretend to be friendly, inviting each other to lunch or discussing various other activities.²⁴ When this covert disagreement is going on, the patient the disagreement relates to will suddenly develop symptoms, by becoming assaultive, destroying property, developing extreme anxiety or becoming paranoid. These symptoms are often reflective of these covert staff disagreements.²⁵ It is felt that the open disagreement and anger between staff does not frighten or scare psychiatric patients, but that the denial and refusal to acknowledge these feelings between staff eventually lead to these exaggerated symptoms.²⁶

The authors consequently found that when disagreements were brought out into the open, the symptoms would quickly disappear. They also found that the mere scheduling of a conference of a particular patient who was creating considerable difficulty, usually lead to a decrease in the symptom long before the actual conference took place.²⁷ The conference could be seen as an admission by the staff that a problem is apparent between them and needs to be resolved.

Rubin²⁸ has discussed the importance of revealing anger to patients, in particular psychiatric patients who will not trust a therapist who is not "upfront" and genuine with his feelings. Rubin noted in particular an instance where a patient spat in his face. He angrily told the patient his feelings about the situation and that he would not tolerate this type of behavior from this person. If we examine this closely, we discover that Rubin is communicating several things implicitly. He is placing the responsibility of the behavior on the patient. He is also communicating that

this patient can control his behavior in more appropriate ways, and is assuring the patient that strong, aggressive feelings will not destroy him or the patient (which is a fear many disturbed individuals have about the tremendous amounts of aggressive feelings they possess), that he cares enough to get angry with the patient and has respect for his own self and well-being by openly confronting the patient. It is also noted that Rubin is giving a model for expression of anger, and is giving permission to the patient to express his feelings, since the helper has set the stage by doing so himself.

The speculations of Kilgalen and Schulz, Stanton and Schwartz, Fry and Rubin all seem to coincide with the theories set forth by Laing²⁹ and Batson, et al³⁰ in their belief that many psychiatric disturbances may be the result of the individual growing up in a family system where there was major incongruencies between the expressed feelings and the behavior of family members, often placing the patient in a double binding "Damned if he did, damned if he doesn't" situation. It is important to note that these types of individuals are extremely susceptible to any kind of mystification with regard to how significant people (significant to the patient) are behaving in contrast to their inner experience; in essence, patients will act out if significant people are not being genuine.

Summary

In summary, there has generally been limited research material that is available on the effects of the therapist's self-disclosure in the therapeutic process. Jourard, Carkhuff and Berensen and Yalom have been some of the few authors to openly address this material. Carkhuff and Jourard are the authors who have actually researched this phenomena. Yalom specifically has looked at it from the standpoint of group psychotherapy, and has been one of the few authors who has been able to integrate self-disclosure within its proper place, without allowing it to become the "All or nothing technique." It must also be remembered that self-disclosure

and confrontation in and of themselves cannot be the only tool a therapist has, and are not substitutes for a theoretical foundation for understanding human behavior. It cannot be used in a strict, mechanical sense, but must also be a quality and a function of a therapist's personality and style. If an individual therapist is not comfortable using disclosures as a tool, he should not, but he needs to question himself as to the purpose for withholding all information about himself.

Too often we become only concerned with our efficiency and proficiency for doing therapy, forgetting that we are working with people and not objects. It is also my feeling that additional research has to be developed on the effects of therapists' disclosure and transparency in the therapeutic process, particularly with regard to individual and group treatment.

It also needs to be looked at from a communication theory standpoint with regard to the early years of development and the messages one is receiving from significant others. As also noted, there are many questions in my mind concerning the use of self-disclosure with suicidal clients. If so, under what conditions can it be appropriately used and what, if any, contraindications for its use are there? It may well be a way of communicating hope to a patient who is suicidal, but it may have problems in that it may take away the despair and the frustration that the person may have causing him to feel more misunderstood and hopeless.

In this area, as well as others, further research needs to be developed to examine the impact of self-disclosure on different client populations.

V-Cillin K[®]

penicillin V potassium

is the most
widely prescribed
brand of oral penicillin

Tablets
125, 250, and 500 mg*
Oral Solution
125 and 250 mg*/5 ml

V-Cillin K[®]
penicillin V potassium

Description: V-Cillin K is the potassium salt of penicillin V. This chemically improved form combines acid stability with immediate solubility and rapid absorption.

Indications: For the treatment of mild to moderately severe pneumococcal respiratory tract infections and mild staphylococcal skin and soft-tissue infections that are sensitive to penicillin G. See the package literature for other indications.

Contraindication: Previous hypersensitivity to penicillin.

Warnings: Serious, occasionally fatal, anaphylactoid reactions have been reported. Some patients with penicillin hypersensitivity have had severe reactions to a cephalosporin; inquire about penicillin, cephalosporin, or other allergies

before treatment. If an allergic reaction occurs, discontinue the drug and treat with the usual agents (e.g., epinephrine or other pressor amines, antihistamines, or corticosteroids).

Precautions: Use with caution in individuals with histories of significant allergies and/or asthma. Do not rely on oral administration in patients with severe illness, nausea, vomiting, gastric dilatation, cardiospasm, or intestinal hypermotility. Occasional patients will not absorb therapeutic amounts given orally. In streptococcal infections, treat until the organism is eliminated (minimum of ten days). With prolonged use, nonsusceptible organisms, including fungi, may overgrow; treat superinfection appropriately.

Adverse Reactions: Hypersensitivity, including fatal anaphylaxis. Nausea, vomiting, epigastric distress, diarrhea, and black, hairy tongue. Skin eruptions, urticaria, reactions resembling serum sickness (including chills, edema, arthralgia, prostration), laryngeal edema, fever, and eosinophilia. Infrequent hemolytic anemia, leukopenia, thrombocytopenia, neuropathy, and nephropathy, usually with high doses of parenteral penicillin.

ROCHE

For recurrent attacks of urinary tract infection in women

Bactrim™ DS Double Strength Tablets

Each tablet contains 160 mg trimethoprim and 800 mg sulfamethoxazole.

Just one tablet b.i.d. for 10 to 14 days

- Action at urinary/vaginal/lower bowel sites helps eliminate reservoirs of infecting organisms
- Distinctive antibacterial action plus wide spectrum helps eradicate recurrent UTI
- Low incidence of bacterial resistance in community practice

- Convenient *b.i.d.* dosage provides day-and-night antibacterial control
- Contraindicated during pregnancy and the nursing period. During therapy, maintain adequate fluid intake; perform CBC's and urinalyses with microscopic examination.

Before prescribing, please consult complete product information, a summary of which follows:

Indications and Usage: For the treatment of urinary tract infections due to susceptible strains of the following organisms: *Escherichia coli*, *Klebsiella-Enterobacter*, *Proteus mirabilis*, *Proteus vulgaris*, *Proteus morganii*. **It is recommended that initial episodes of uncomplicated urinary tract infections be treated with a single effective antibacterial agent rather than the combination.** Note: The increasing frequency of resistant organisms limits the usefulness of all antibacterials, especially in these urinary tract infections.

Also for the treatment of documented *Pneumocystis carinii* pneumonitis. To date, this drug has been tested only in patients 9 months to 16 years of age who were immunosuppressed by cancer therapy.

The recommended quantitative disc susceptibility method (*Federal Register*, 37:20527-20529, 1972) may be used to estimate bacterial susceptibility to Bactrim. A laboratory report of "Susceptible to trimethoprim-sulfamethoxazole" indicates an infection likely to respond to Bactrim therapy. If infection is confined to the urine, "Intermediate susceptibility" also indicates a likely response. "Resistant" indicates that response is unlikely.

Contraindications: Hypersensitivity to trimethoprim or sulfonamides; pregnancy; nursing mothers; infants less than two months of age.

Warnings: Deaths from hypersensitivity reactions, agranulocytosis, aplastic anemia and other blood dyscrasias have been associated with sulfonamides. Experience with trimethoprim is much more limited but occasional interference with hematopoiesis has been reported as well as an increased incidence of thrombopenia with purpura in elderly patients on certain diuretics, primarily thiazides. Sore throat, fever, pallor, purpura or jaundice may be early signs of serious blood disorders. Frequent CBC's are recommended; therapy should be discontinued if a significantly reduced count of any formed blood element is noted.

Precautions: Use cautiously in patients with impaired renal or hepatic function, possible folate deficiency, severe allergy or bronchial asthma. In patients with glucose-6-phosphate dehydrogenase deficiency, hemolysis, frequently dose-related, may occur. During therapy, maintain adequate fluid intake and perform frequent urinalyses, with careful microscopic examination, and renal function tests, particularly where there is impaired renal function.

Adverse Reactions: All major reactions to sulfonamides and trimethoprim are included, even if not reported with Bactrim. **Blood dyscrasias:** Agranulocytosis, aplastic anemia, megaloblastic anemia, thrombopenia, leukopenia, hemolytic anemia, purpura, hypoprothrombinemia and methemoglobinemia. **Allergic reactions:** Erythema multiforme, Stevens-Johnson syndrome, generalized skin eruptions, epidermal necrolysis, urticaria, serum sickness, pruritus, exfoliative dermatitis, anaphylactoid reactions, periorbital edema, conjunctival and scleral injection, photosensitization, arthralgia and allergic myocarditis. **Gastrointestinal reactions:** Glossitis, stomatitis, nausea, emesis, abdominal pains, hepatitis, diarrhea and pancreatitis. **CNS reactions:** Headache,

peripheral neuritis, mental depression, convulsions, ataxia, hallucinations, tinnitus, vertigo, insomnia, apathy, fatigue, muscle weakness and nervousness. **Miscellaneous reactions:** Drug fever, chills, toxic nephrosis with oliguria and anuria, periarteritis nodosa and L. E. phenomenon. Due to certain chemical similarities to some goitrogens, diuretics (acetazolamide, thiazides) and oral hypoglycemic agents, sulfonamides have caused rare instances of goiter production, diuresis and hypoglycemia in patients; cross-sensitivity with these agents may exist. In rats, long-term therapy with sulfonamides has produced thyroid malignancies.

Dosage: Not recommended for infants less than two months of age.

Urinary Tract Infections: Usual adult dosage—1 DS tablet (double strength), 2 tablets (single strength) or 4 teasp. (20 ml) b.i.d. for 10-14 days.

Recommended dosage for children—8 mg/kg trimethoprim and 40 mg/kg sulfamethoxazole per 24 hours, in two divided doses for 10 days. A guide follows:

Children two months of age or older:

Weight		Dose—every 12 hours	
lbs	kgs	Teaspoonfuls	Tablets
20	9	1 teasp. (5 ml)	½ tablet
40	18	2 teasp. (10 ml)	1 tablet
60	27	3 teasp. (15 ml)	1½ tablets
80	36	4 teasp. (20 ml)	2 tablets or 1 DS tablet

For patients with renal impairment:

Creatinine Clearance (ml/min)	Recommended Dosage Regimen
Above 30	Usual standard regimen
15-30	½ the usual regimen
Below 15	Use not recommended

***Pneumocystis carinii* pneumonitis:** Recommended dosage: 20 mg/kg trimethoprim and 100 mg/kg sulfamethoxazole per 24 hours in equal doses every 6 hours for 14 days. See complete product information for suggested children's dosage table.

Supplied: *Double Strength (DS) tablets*, each containing 160 mg trimethoprim and 800 mg sulfamethoxazole, bottles of 100; Tel-E-Dose® packages of 100. *Tablets*, each containing 80 mg trimethoprim and 400 mg sulfamethoxazole—bottles of 100 and 500; Tel-E-Dose® packages of 100; Prescription Paks of 40, available singly and in trays of 10. *Oral suspension*, containing in each teaspoonful (5 ml) the equivalent of 40 mg trimethoprim and 200 mg sulfamethoxazole, fruit-licorice flavored—bottles of 16 oz (1 pint).

ROCHE

Roche Laboratories
Division of Hoffmann-La Roche Inc.
Nutley, New Jersey 07110

Please see back cover.

Her next attack of cystitis may require

the BactrimTM 3-system counterattack

ROCHE

Bactrim has shown high clinical effectiveness in recurrent cystitis as a result of its wide spectrum and distinctive antimicrobial action in the urinary, vaginal and lower intestinal tracts.

The probability of recurrent urinary tract infection appears to be enhanced by the establishment of large numbers of *E. coli* or other urinary pathogens on the vaginal introitus. The trimethoprim component of

Bactrim diffuses into vaginal fluid in effective concentrations, thus combating migration of pathogens into the urethra.

Studies have shown that Bactrim acts against *Enterobacteriaceae* in the bowel without the emergence of resistant organisms. Thus, Bactrim reduces the risk of introital colonization by fecal uropathogens. It has *no* significant effect on other normal, necessary intestinal flora.

Bactrim fights uropathogens in the urinary tract/vaginal tract/lower intestinal tract

Please see reverse side for summary of product information.

Physicians. Isn't It Time Your Career Had A Check-Up?

Of course, we don't mean that your career isn't a healthy one. We just want to draw your attention to the career opportunities and benefits the Air Force can offer. You'll discover that the Air Force is a challenging and rewarding way of life. Our hospitals and clinics are outstanding. Plus, we'll pay relocation expenses for your family and household goods when you move. If you're interested in our medical career plan, find out all the facts. Sometimes, even a healthy career could use a check-up.

Air Force. A great way of life.

Don't drive by Charles and 24th without stopping to see the extraordinary 1979 Eldorado.

Chesapeake Cadillac invites you to see and drive a new breed of Eldorado. A triumph of advanced engineering and traditional Cadillac quality with an unprecedented combination of features that make Eldorado for 1979 unique in the luxury car field.

Front-wheel drive for sure traction and increased interior room. Four-wheel independent suspension for an incredibly smooth ride. Electronic fuel injection for quick

response and smooth performance. Front-wheel disc brakes for rapid heat dissipation and superb braking efficiency. Electronic level control that adjusts to changing loads automatically. Side window defoggers. All standard on the '79 Eldorado.

And, there's one more thing that's standard. Not on all Cadillacs, but on every Cadillac from Chesapeake. Chesapeake Priority Service.

Because we believe if you own a Cadillac, you ought to be treated like a Cadillac owner.

And you'll be surprised at how easy it is to be a Cadillac owner at Chesapeake.

You see, Chesapeake can afford to sell for less. Because we've been selling and servicing Cadillacs, and only Cadillacs, for over half a century. And, we sell more than anyone else. There's got to be a reason.

PERFORMANCE. PROVEN EFFECTIVENESS WITHIN A WIDE SAFETY MARGIN.

While Roche Laboratories already knows more about the performance of Librium than anyone else, we keep on learning every day.

For example, the highly favorable benefits-to-risk ratio of Librium is a well-documented matter of record.

And, of course, the specific calming action of Librium has been demonstrated in millions of patients around the world. In a large number of these patients, Librium was used concomitantly with other primary medications.

Proven performance within a wide safety margin. Basically, that's what Librium is all about.

LIBRIUM® chlordiazepoxide HCl/Roche THE ANXIETY-SPECIFIC

Before prescribing, please consult complete product information, a summary of which follows:

Indications: Relief of anxiety and tension occurring alone or accompanying various disease states. Efficacy beyond four months not established by systematic clinical studies. Periodic reassessment of therapy recommended.

Contraindications: Patients with known hypersensitivity to the drug.

Warnings: Warn patients that mental and/or physical abilities required for tasks such as driving or operating machinery may be impaired, as may be mental alertness in children, and that concomitant use with alcohol or CNS depressants may have an additive effect. Though physical and psychological dependence have rarely been reported on recommended doses, use caution in administering to addiction-prone individuals or those who might increase dosage; withdrawal symptoms (including convulsions), following discontinuation of the drug and similar to those seen with barbiturates, have been reported.

Usage in Pregnancy: Use of minor tranquilizers during first trimester should almost always be avoided because of increased risk of congenital malforma-

tions as suggested in several studies. Consider possibility of pregnancy when instituting therapy; advise patients to discuss therapy if they intend to or do become pregnant.

Precautions: In the elderly and debilitated, and in children over six, limit to smallest effective dosage (initially 10 mg or less per day) to preclude ataxia or oversedation, increasing gradually as needed and tolerated. Not recommended in children under six. Though generally not recommended, if combination therapy with other psychotropics seems indicated, carefully consider individual pharmacologic effects, particularly in use of potentiating drugs such as MAO inhibitors and phenothiazines. Observe usual precautions in presence of impaired renal or hepatic function. Paradoxical reactions (e.g., excitement, stimulation and acute rage) have been reported in psychiatric patients and hyperactive aggressive children. Employ usual precautions in treatment of anxiety states with evidence of impending depression; suicidal tendencies may be present and protective measures necessary. Variable effects on blood coagulation have been reported very rarely in patients receiving the drug and oral anticoagulants; causal relationship has not been established clinically.

Adverse Reactions: Drowsiness, ataxia and confusion may occur, especially in the elderly and debilitated. These are reversible in most instances by proper dosage adjustment, but are also occasionally observed at the lower dosage ranges. In a few instances syncope has been reported. Also encountered are isolated instances of skin eruptions, edema, minor menstrual irregularities, nausea and constipation, extrapyramidal symptoms, increased and decreased libido—all infrequent and generally controlled with dosage reduction; changes in EEG patterns (low-voltage fast activity) may appear during and after treatment; blood dyscrasias (including agranulocytosis), jaundice and hepatic dysfunction have been reported occasionally, making periodic blood counts and liver function tests advisable during protracted therapy.

Supplied: Librium® Capsules containing 5 mg, 10 mg or 25 mg chlordiazepoxide HCl. Libritab® Tablets containing 5 mg, 10 mg or 25 mg chlordiazepoxide.

V-Cillin K[®]

penicillin V potassium

is the most
widely prescribed
brand of oral penicillin

Tablets
125, 250, and 500 mg*
Oral Solution
125 and 250 mg*/5 ml

V-Cillin K^{*}
penicillin V potassium

Description: V-Cillin K is the potassium salt of penicillin V. This chemically improved form combines acid stability with immediate solubility and rapid absorption.

Indications: For the treatment of mild to moderately severe pneumococcal respiratory tract infections and mild staphylococcal skin and soft-tissue infections that are sensitive to penicillin G. See the package literature for other indications.

Contraindication: Previous hypersensitivity to penicillin.

Warnings: Serious, occasionally fatal, anaphylactoid reactions have been reported. Some patients with penicillin hypersensitivity have had severe reactions to a cephalosporin; inquire about penicillin, cephalosporin, or other allergies

before treatment. If an allergic reaction occurs, discontinue the drug and treat with the usual agents (e.g., epinephrine or other pressor amines, antihistamines, or corticosteroids).

Precautions: Use with caution in individuals with histories of significant allergies and/or asthma. Do not rely on oral administration in patients with severe illness, nausea, vomiting, gastric dilatation, cardiospasm, or intestinal hypermotility. Occasional patients will not absorb therapeutic amounts given orally. In streptococcal infections, treat until the organism is eliminated (minimum of ten days). With prolonged use, nonsusceptible organisms, including fungi, may overgrow; treat superinfection appropriately.

Adverse Reactions: Hypersensitivity, including fatal anaphylaxis. Nausea, vomiting, epigastric distress, diarrhea, and black, hairy tongue. Skin eruptions, urticaria, reactions resembling serum sickness (including chills, edema, arthralgia, prostration), laryngeal edema, fever, and eosinophilia. Infrequent hemolytic anemia, leukopenia, thrombocytopenia, neuropathy, and nephropathy, usually with high doses of parenteral penicillin.

(102175)

***Equivalent to penicillin V.**

The Maker

Examining a Few Myths About Prescribing.

Increasing pressure is being put on the practicing physician to prescribe drugs generically. You are told that brand-name products are universally "expensive" and generic versions are relatively "cheap." To make this case, the most extreme (rather than typical) price differentials are cited. Thus, consumers are led to believe that such differentials are commonplace. Even your knowledge and your motives as a physician are questioned.

Understandably, these views have created myths. We think it's time to examine them in the light of all the facts and ramifications.

MYTH: There are no differences in quality and performance between brand-name products and their generic counterparts. The corollary is that there are no differences among products made by high-technology, quality-conscious, research-based companies and those made by commodity-type suppliers.

FACT: The Food and Drug Administration does a good job in monitoring a generally excellent drug supply. Still, it has nowhere near the resources to guarantee the quality and bioavailability of all marketed products at any given time. Just a few months ago, for example, it noted that batches of tetracycline HCl capsules which met official monograph requirements were

not bioequivalent to a reference product. As you know, there is substantial literature on this subject affecting many drugs, including such antibiotics as tetracycline and erythromycin. The record on drug recalls and court actions affirms strongly that there are differences among pharmaceutical companies and their products. Research-intensive companies have far better records than those that do no research and may practice minimum quality assurance.

MYTH: Industry favors only "expensive" brand names and denigrates all generics.

FACT: PMA companies make 90 to 95 percent of the drug supply, including, therefore, most of the generics. Drug nomenclature is not the important point; it's the competence of the manufacturer and the integrity of the product that count.

Matters.

MYTH: Generic options almost always exist.

FACT: About 55 percent of prescription drug expenditure is for single-source drugs. This means, of course, that for only 45 percent of such expenditure, is a generic prescribing option available.

MYTH: Generic prescriptions are filled with inexpensive generics, thus saving consumers large sums of money.

FACT: Market data show that you invariably prescribe—and pharmacists dispense—both brand and generically labeled products from known and trusted sources, in the best interest of patients. In most cases the patient receives a proven brand product. Savings from voluntary or mandated generic prescribing are grossly exaggerated.

MYTH: Drugs account for a major portion of the rise in health care costs.

FACT: Drugs represent a very small part of such costs. The amount of the health care dollar spent for prescription drugs was about 12 cents in 1967; today it is about 8 cents. And you as a physician are most conscious of how drug therapy can cut hospitalization, avert surgery, reduce office visits and keep patients on the job.

MYTH: Government intrusions into the marketplace will save tax money.

FACT: Government schemes always cost the taxpayer something, and the costs often exceed the benefits. Certainly, any federal "help," such as lists of wholesale drug prices sent to all physicians and pharmacists, will be no exception. Just think of the expense of keeping them current! Moreover, wholesale prices are poor guides to actual transaction prices and even worse guides to retail prices.

The PMA Position

We believe your freedom to prescribe, either by generic or brand name, should be totally unabridged. Otherwise, your prescribing prerogatives and your relationships with patients will be seriously impaired.

The maker does matter

After the myths about price and equivalency have been shattered, one fact stands out more clearly than ever: *The maker does matter.* As always, your best guide to drug therapy for your patients is to select products—both brands and generics—from manufacturers with credentials and performance records you have come to respect.

"Question the Veracity"

To the Editor:

In reference to the recent article (February, 1979—ed. note) on **The Role of Podiatry** by Drs. Harry F. Klinefelter and Neil M. Scheffler, I question the veracity of several of the statements in the article.

Although there is a definite role for podiatry, I found that not all podiatrists have a level of training that are exemplified by Dr. Scheffler and a few of his associates, and question the blanket "carte blanche" professed in this report. Technical skills vary like in other professionals. Specifically, I object to the statement that podiatrists are accepted members of the medical community and have direct patient responsibility and a legal right to make and act upon their own independent medical judgment. This particular statement is a direct quote from the article. Dr. Klinefelter and others certainly realize that although these people have admitting privileges at some hospitals, and have indeed even Residents for their services, they are under the direction of or in another Medical Department for medical expertise and/or control/responsibility. I particularly object to the quotation from Dr. Sherman Coleman, President of the American Orthopedic Association, being used as an insult against orthopedics. The intent in using this is say that orthopedists no longer are qualified for foot surgery and that all foot surgery should be done by a

podiatrist. I certainly do not consider most of the procedures that the podiatrists do at this time as very specialized surgery. Furthermore, many of us in orthopedics have maintained an interest in foot problems.

In conclusion, the most significant information presented in the article is the article's conclusion in which they state that there should be a mutual exchange of ideas and techniques. I have attempted to do this in the past with several members of the podiatry community, but articles like this tend to make me somewhat enflamed and take away from some of the good coordinated activities that have been carried out in the past. This, indeed, is no indictment or any other reflection upon podiatry, except that the article was simply publicity in order to allow the podiatrists to gain a greater position on hospital staffs, but should, I think, be closely monitored by hospital medical staff executive committees in order to ensure quality care in our hospitals.

Thank you for your interest in this matter.

FRANK T. BARRANCO, MD

Baltimore, MD 21210

Dr. Scheffler's Reply

To the Editor:

Dr. Frank T. Barranco's comments on our article (**The Role of Podiatry**, February, 1979) are somewhat inaccurate. I do not believe that we suggested that all podiatrists are equally-trained. Variations in residency programs and podiatry school training, of course, do exist. The American Board of Podiatric Surgery and the American College of Foot Surgeons realize these variations and confer membership accordingly, just as corresponding groups in orthopedics do. Incidentally, the skills of orthopedists in Maryland who do not do as much foot surgery as does Dr. Barranco varies quite a bit. This is what Dr. Coleman referred to in his address **Specialty Training**. Podiatrists do just that. We specialize, and I believe that improves the care we give our patients. For the most part, however, the practitioners in Maryland exhibit an extremely high level of competency. As a member of the State Board of Podiatry Examiners, I am in a position to examine and screen applicants for licensure and have been impressed by their knowledge.

The statement regarding "Direct patient responsibility and the legal right to make and act upon their own medical judgment" is correct. In hospital situations, we have independent judgment regarding our areas of practice. The physicians with whom we consult are responsible for the patients' overall medical care—not their foot surgery. All four hospitals at which I work include the Section of Podiatry under the Department of Surgery—a similar status to the Section of Orthopedics.

I am surprised that Dr. Barranco, as a member of the Foot Society of the American Orthopedic Association,

ation, does not regard foot surgery as "very specialized." I do. How much more specialized can you get than limiting your care to just the foot?

The article was never intended to be an attack upon orthopedics. My personal relations with orthopedists has shown that we can and will continue to work together for the benefit of the patient. Only when some members of the orthopedic community attempt to protect their turf from intrusion by podiatrists who can do similar procedures as well or better than they will there be any air of contention.

THE SAVINGS BANK OF BALTIMORE

Inaugural Address: Enlist, Enlarge, Enrich—With Enthusiasm!

It is with mixed emotions that I accept the position as the 30th President of the Auxiliary to the Medical and Chirurgical Faculty of the State of Maryland. At the same time, I feel humility at the confidence placed in me, I also sense great pride at having the opportunity of leading what I consider one of the most vital, most privileged, most influential groups in this or any other state.

Having served as State Membership Chairman for two years, I have been totally indoctrinated with the concepts and techniques of enlistment. With the use of letters, personal notes, workshops, phone calls and on-site visits, I have tried to assist our 13 Component Chairmen in recruiting, retaining and reenlisting members. Out of a possible 5,000 last year, we netted a total of only 893 members. This year, in spite of my best efforts and those of our County Chairmen, we are following a national trend and experiencing a decline. Considering the importance of the Auxiliary, how can this be?

For me, the Auxiliary is not an optional organization. Old-fashioned as it may seem, I still adhere to the concept that when I became married, I made a commitment to my husband—to help him in any way possible—personally and professionally. He is committed to the practice of medicine; I am committed to him; therefore, I am committed to a deep, abiding interest in his profession. The Auxiliary offers me this opportunity as no other organization can. It enables me to extend and enhance my spouse's position in the community. No one can represent him as well as I can, and no organization can represent the physicians of this state as well as the Auxiliary can. If we do not assume the task of providing a unified backing for today's physicians, no other group can or will. Our organization desperately needs the untapped power of individuals if we are to function collectively in an impressive, effective man-

ner. Why, then, are we finding such difficulty in enlisting these potential power cells?

In a recent address, National Auxiliary President Muriel Bergness stated that any organization which is finding it hard to recruit members has simply not kept up with the times. Perhaps before we exert all our energies in enlistment, we need to make an introspective examination of ourselves as Auxilians and determine whether we have indeed kept up with the times.

Could it be possible that we have become so entrenched in a yearly format of "the-way-we've-always-done-it" approach that our potential members are finding more fulfilling opportunities in other organizations? Do we need to enlarge our vision, providing more challenging, long-range projects which call for a sustained involvement? Have we been realistic in accounting for different lifestyles and priorities? The Auxiliary needs unity, not uniformity. There is vitality in diversity of talents, interests and abilities. Have we provided for a diversity of opinions and approaches?

As vital as is enlargement, to expand ourselves collectively without enriching ourselves personally would be an injustice. If we are to communicate intelligently within medical circles, if we are to understand our husbands' concern about HMO, PRSO, HSA, etc., then we must become well-versed in the concepts and the language of medicine today. Only with this kind of awareness can we comprehend the physicians' position; only with knowledge of the truth about the profession can we combat public misconceptions and offer a rebuttle to the deluge of half-truths in articles of the "How-to-Sue-Your Doctor" variety.

One of the greatest benefits of Auxiliary membership is the cultivation of friendships within the professional family. No matter how much we do on behalf of the profession, we should never minimize the blessings of fellowship and friendship within it. There is no substitute for the support and camaraderie offered within the medical family.

This year, I propose that we enlist, enlarge and enrich ourselves within the Auxiliary. How can we possibly accomplish so formiddable a task? It will take much patience and determination but, above all, I believe it will take enthusiasm. Emerson said, "Nothing great was ever achieved without enthusiasm." Perhaps this is the ingredient we need most if we are to achieve the true greatness of which our Auxiliary is so capable.

Maryland Medical Political Action Committee

RICHARD F. MOSCHELL, MD,
Chairman

MRS. FRANCIS C. MAYLE
Editor

Membership

Unity among physicians remains a top priority item. Some liberal US Senators are trying to push through Congress an all-inclusive National Health Insurance bill. Admittedly, an adverse economic climate enhances its difficulty, even failure in passage. This brief respite does **not** mean that organized medicine can allow its resistance to unfavorable legislative policies to slumber, but rather **ALL EFFORTS AND RESOURCES MUST INTENSIFY.**

A modality for action is membership in the Maryland Medical Political Action Committee. There are two types of membership. The first and most important is the category of Sustaining membership; the contribution for member and spouse is \$150. Another category is Regular membership; the contribution for member and spouse is \$45. It is apparent that the greater the contributions, the more effective your MMPAC will be.

Sustaining membership is a unique category. Its members generally tend to be more aware of the necessity of increased commitment. They realize that private medicine must release former restraints and flex its muscle. It must have input into the democratic processes.

Sustaining members are identified by the 99+ pin. Mailings include the Political Stethoscope Newsletter and a Sustainer Newsletter.

The Regular Membership has already grown into the thousands. Of this we are justly proud. The Sustaining members are as follows: (We urge you to join the list.)

MARYLAND MEDICAID & MEDICARE APPROVED

At Manor Care we have you in mind, too.

When Manor Care coordinates medical services, we keep the physician as well as the patient in mind.

All seven of our Maryland centers offer:

- * A Registered Physical Therapist to carry out any therapy orders you prescribe.

- * A food service manager consulting with a Registered Dietician to provide any special diets your patient needs.

- * A unit dose medication system to ensure the freshness and accuracy of your prescriptions.

- * Extensive in-service education programs to keep the nursing staff up-to-date on new concepts and to review basic geriatric practices.

CONRAD ACTON, MD, Editor

"A Slight Snow . . ."

Correction

(In the report of the October, 1978 Meeting, Dr. Harry F. Klinefelter is reported as saying that "Remissions are so frequent that it is difficult to determine whether any improvement is really due to the medication or would have occurred on its own." He actually made it quite clear that this was true only in the first six months and that if no remission has occurred *after* six months, it is unlikely that it will occur without treatment. The omission was inadvertent and is regretted.—CA.)

Because of "a slight snow" on Feb. 20, 1979, the Directors' regular meeting was held the following Tuesday.

PRC Reports

A report from the Professional Relations Committee indicated that in two instances, moonlighting interns had been employed by lay corporations under dubious circumstances. The Committee recommends that the BCMS make an effort to remind house officers to investigate prospective employers carefully before they become involved in what may be inappropriate activities. This could be done by reminding hospital administrators and chiefs of staff of their responsibility in this regard. The Committee feels that Residents should be particularly cautious about being employed by lay businesses which are relatively new.

Public Relations Committee

The Directors agreed with the first of two recommendations by the Public Relations Committee. Its Subcommittee on Cost Containment wants physicians to be more energetic in their efforts to reduce costs, both in their own offices and in their institutions. To this end, they recommend that the Newsletter have a regular column, a **Cost Containment Corner** for specific advice to physicians on how better to control medical care costs for their patients. A second recommendation, that the BCMS adopt the Primary Alcoholism Treatment Center and act as a facilitator in locating equipment and material from other segments of the community, was approved and referred back to the Public Relations Committee for implementation.

Snow Interviews . . .

Partly recovered from the February, '79 blizzard, faithful followers of the BCMS beat their way to the Hollyday Room for their regular, monthly meeting on March 1st. President Antlitz brought out the importance of our electing our **own** members to the Med-Chi Council. The BCMS worked hard—along with other component societies—to bring it about. This is the first year we can elect our own rather than have them se-

lected for us by the Council. Unfortunately, though the blizzard disrupted the delivery of mail to such an extent that many received their ballots **after** the voting deadline. Those ballots will be destroyed unopened and an entire, new mailing will be sent and is just as important.

Legislative Committee

The Legislative Committee, through Mr. Richard Rombro, brought news about the State Legislature's medical activities. Highlights include Amendments to the Podiatry Act to extend the scope of that practice and the Optometric Act doing the same for Optometrists.

The BCMS joined Med-Chi in opposing any extension of the Health Services Cost Review Commission's role to include physician's charges.

The perennial debate about who should **identify** specialists to the public in various listings, such as the **Yellow Pages**, is on again. That there are adequate **certifying** agencies is agreed, but since some physicians consider themselves specialists, and limit their practice but do not get themselves certified, a gap exists. Should this matter of **identification** be added to the Board of Medical Examiners domain? If so, what would be the legal consequences?

Other problems are: Whether a Health Maintenance Organization can be certified as such without an associated or back-up hospital? Should health research be done on inmates of State institutions? Should there be the possible abolition of the State Health Department Board of Review? And, finally, the ramifications of Hand-Gun Control measures?

Dr. Bormel

Paul Bormel, MD, President of the BCMS Foundation, invited us to the Foundation's dinner/dance celebrating Doctor's Day. He urged us all to come, bring guests and support the Foundation.

Dr. Nachlas Speaks

Marvin Nachlas, MD, spoke in opposition to the current socioeconomic phraseology of government regulations about the practice of medicine. He introduced a motion "That in all the general meetings of the BCMS, in its committee meetings, correspondence and publications, carefully-chosen words of known and clear meaning to the medical profession be used once again, and that the current ambiguous and fashionable terminology of the health care planners be assiduously avoided." He declared that "a health care provider was not necessarily a physician. It could be a paramed-

technician, nurse, pharmacist, dentist, podiatrist or optometrist—perhaps a chiropractor. Such phraseology makes patients into consumers, physicians into vendors, medical practice into health care delivery systems. After much discussion, the motion was adopted.

Dr. Siebens Talks

Arthur Siebens, MD, Professor of Rehabilitation Medicine and Director of Surgery of the Division of Rehabilitation Medicine at Johns Hopkins University and Hospital and Director of the Department of Rehabilitation Medicine at the Good Samaritan Hospital, presented the topic **Rehabilitation of the Severely-Neurologically-Traumatized Patient**. He reminded us first of all that trauma leads all causes of death in the 1-44-year age-group and that the trauma-disabled number 3-4 times the number of deaths. Conducting his "rounds" with colored slides, he graphically-illustrated the problems of tracheal stenosis, seizure control and differentiation and respiratory inadequacy, stressing that success has to be a team effort. The physician in this field must convince the patient that the prognosis is honest and often has to be content with limited gains. Accident prevention is better than treatment.

Directors Meet

Better weather prevailing, the Directors met March 20, 1979, their regularly-scheduled date. A letter from John King, Esq., our legal counsel, informed the Society that his former associate in BCMS affairs, Mr. Richard Bloch, would be replaced by Mr. King and Mr. E. Dale Adkins, III for the time being when legal advice is needed.

Howard A. Davidow, MD, Chairman of the Membership Committee, brought recommendations to the Directors. One was for presentation of Membership Certificates to new members when elected. The certificates would be suitable for framing and available to all members on request. Another Recommendation was in opposition to "unified" membership with the AMA. The Committee noted that this had been voted against at local and state levels in the past. A loss of memberships might follow compulsory unification.

A Motion adopted at the March General Meeting was considered. It opposed bureaucratic terminology for medical practice. Since the motion was enforceable only within our own Society, and since our staff, already very strict about its medical phraseology, needs no prodding, no action was taken at this time.

Charlotte Ferencz, MD, Professor at Maryland's Department of Epidemiology and Preventive Medicine, wrote the Society requesting financial support for student study fellowships. Such studies were supported by the Maryland Department of Health and Mental Hygiene, but discontinued a few years ago. This year, the Bureau of Health Manpower Apprenticeship Training's grant funding was stopped and is no longer available for this purpose. Such summer fellowship stipend is usually \$1,000 for the eight-week period.

The Directors decided they could not afford the added cost since a study of private practice profiles is already being sponsored. An alternate proposal within

BCMS scope was suggested for perhaps an annual prize for the best work done. It was further noted that such funding would be more appropriately sponsored by the older, established organizations such as the Heart Fund, Cancer Society, Christmas Seals and the like which have greater experience along these lines; after all, if the BCMS supports one worthy cause, it should support them all. The request was referred to the Committee on Public Education.

The pictorial **Register** of the members in 1975 was a success. Now it is proposed to bring it up-to-date with a new **Register**. The photographers who did the first one have offered a similar contract. The Directors agreed that it was appropriate to bring the **Register** up to date.

The Policy and Planning Committee recommends that the BCMS add to its member services by keeping a list of temporary secretarial help. The roster would be compiled from members who could give names of satisfactory past employees. The staff felt it would not involve serious additional work and would be a good list to have. The Directors went along with this.

Reports from the Health Care Delivery Committee and from the Legislative Committee were quite long. They were surveyed in detail. The Recommendations were generally concurred in.

"The burden grows . . ."

The scope of the **Monthly Newsletter** continues to expand. So far, the staff and Secretary Karl H. Weaver, MD have labored mightily and bring forth a fine publication, but the burden grows. The Board decided that an Editorial Board should be chosen to help with policy and production.

Boy Scout Time is here again. Sam O'Mansky, MD, Chairman of the Subcommittee to provide Medical Coverage for the Broad Creek Camp, wants volunteers to give one Sunday afternoon at the camp this summer. If you have the Heart to Help, call him at 661-2222 and get the date that suits you best to go there. It is a great project and a great day! ☐

Executive Director's Newsletter

June, 1979

LEGISLATIVE

MEASURES

After July 1, physicians performing abortions will be required to inform the patient about available alternatives including financial assistance and adoption information. The Departments of Human Resources and Health and Mental Hygiene will develop the information. Patients will sign a document indicating the receipt of the information which will become part of the medical record. Failure to comply is subject to a fine of \$500.

All drugs dispensed privately by physicians except for emergency or starter doses will be required to be labeled with the name, dosage strength, expiration date and special handling instructions of the drug after July 1, 1979.

The generic drug law has been rewritten replacing the negative formulary with a positive one, removing the provision for the pharmacist to pass on the cost saving to the consumer, and removing any liability for substitution from the pharmacist.

NEW

Newly elected Faculty officers include the following:

FACULTY

President - William A. Pillsbury, Jr., MD, Lutherville
President-elect - Vincent J. Fiocco, Jr., MD, Westminster
Secretary - Bernard S. Karpers, Jr., MD, Baltimore
Treasurer - Robert B. Goldstein, MD, Baltimore

OFFICERS

Vice Presidents for the year are:

First Vice President - Donald J. Roop, MD, Towson
Second Vice President - J. Roy Guyther, MD, Mechanicsville
Third Vice President - Herbert H. Leighton, MD, Oakland

Council Chairman is Albert M. Antlitz, MD, of Baltimore, and Council Vice Chairman is J. Roy Guyther, M.D.

SECOND

OPINION

USE

Blue Shield of Maryland, Inc., has reported that a total of 15 calls have been made by its subscribers who are eligible for payment of second opinion services, since its inception several months ago. This is less than 1% of those eligible for this benefit who are utilizing it.

More details are not available at this time, such as whether or not such second opinion resulted in surgery, delayed surgery with surgery being performed at a later date, or no surgery at all.

PHYSICIANS'
COSTS AND
FEES

Physician Fee and Cost Indicators is included as an insert in the May 18, 1979 issue of AM NEWS. This booklet is an attempt by AMA to assist physicians in tracking costs and fees.

The first part of a dual system, the Physician's Fee Index (PFI) presents a method to measure the approximate overall rate of increase in your fees—for your information and for comparison with other economic gauges (such as the Consumer Price Index).

The second part, the Physician's Cost Index (PCI) provides a measure of the individual physician's rate of increase in direct and overhead expenses. This may help to identify the areas where cost increases appear out of line with general inflation.

If you have misplaced this insert, contact the Faculty office for a duplicate.

SEMIANNUAL
MEETING

Plans are now underway for the Semiannual Session to be held in New Orleans, Louisiana, September 12-16, 1979. Reservations for this meeting should be made through the Travel Guide Agency (Patricia Orem - 301-727-1811). Cost of the entire trip, including air fare, baggage handling, airport transfers in New Orleans, a welcome cocktail party, a breakfast at Brennans, and a farewell dinner - \$489 per person.

The House of Delegates session will be held in Baltimore at the Faculty Building on Saturday, September 29, 1979, commencing at 2 PM. The General Meeting of the Faculty will be held immediately following adjournment of the House.

Resolutions for consideration at the Faculty's Semiannual meeting of its House of Delegates must be in the Faculty office AT LEAST EIGHT WEEKS PRIOR TO THE DATE OF THE MEETING. This would mean that resolutions must be received prior to the close of business on

FRIDAY, AUGUST 3, 1979.

AN EXTENSION OF HOPE FOR THE ALCOHOLIC

HIDDEN BROOK BEL AIR

Established 1968

We are pleased to announce the opening of Hidden Brook at Warwick. This is a major new enlargement of our capacity for the treatment of alcoholics...an expansion of 20 additional beds to the 39 already at Bel Air. Beautifully situated on the waterfront of the Warwick River near Secretary, Maryland in Dorchester County...the total environment is peaceful and ideally conducive to rehabilitation. The program, philosophy and rates of Hidden Brook at Warwick will be identical and interchangeable in every respect with the program at Hidden Brook, Bel Air. Request our brochure. Write or phone for information.

Now, in addition HIDDEN BROOK at WARWICK

The Library Page

Your Will Can Help

A major function of the Faculty, as defined in the charter given it by the Maryland Legislature in 1798, is to disseminate "medical and chirurgical knowledge throughout the state." The Medical Library is one means used by the Faculty to meet this charge. The Library's major function is to provide member physicians with timely and up-to-date information to assist them in their practice. In 1978, the Library answered almost 9,000 patient-care-related questions from Faculty members. Answers took the form of photocopied journal articles, bibliographies and loans of books; these services went to physicians in every part of Maryland, and almost all were transacted by mail or telephone.

Next year, the Faculty Library will celebrate its 150th birthday, and it is now more vigorous, more widely-used and more progressive than ever before. Past donations have made this development possible. Your additional support will enable the Library to broaden, strengthen and improve its services.

Including the Faculty Library in a will is one way Faculty members can show their appreciation for the services they have received from the Library. With such a bequest, the physician's lifework, dedicated to the care and healing of the sick, will be carried on by future physicians who will benefit from the bequest.

A bequest can take many forms, and the following information is not intended to be inclusive or to suggest the preparation of a will without the services of legal counsel:

1. An unrestricted bequest:

"I give and bequeath (\$.....) to the Medical and Chirurgical Faculty Charitable-Educational Foundation, Inc., for the use of the Faculty Library."

This bequest can be used by the Library for any purpose. Such funds are especially useful because they meet any needs that arise in the undisclosed future.

2. A bequest restricted as to principal, but not restricted as to income:

"I give and bequeath (\$.....) to the Medical and Chirurgical Faculty Charitable-Educational Foundation, Inc., for the use of the Faculty Library."

"The principal of this gift shall be held, and it may be mingled with other funds of the Foundation for investment. The income is to be expended for the benefit of the Library for any purpose."

(Optional provision: "This gift is made in memory of and shall

be known as the Fund.")

The principal of the money thus given creates a permanent fund. This form of gift is especially suitable for endowments, since the income is available at any time for any urgent need.

3. A bequest to be held as a permanent fund, the income to be used for a special purpose:

"I give and bequeath (\$.....) to the Medical and Chirurgical Faculty Charitable-Educational Foundation, Inc., for the use of the Faculty Library. The principal of this gift shall be held, and it may be mingled with other funds of the Foundation for investment. The net income shall be used to: (here describe the primary intended purpose, such as: the purchase of books and journals in a particular field of medicine, e.g., obstetrics; to provide for the salary of a librarian; to purchase audiovisual equipment for continuing medical education; etc.)

(Optional provision: "This gift is made in memory of and shall be known as the Fund.")

Money given in this way establishes a permanent fund, which is a most satisfactory memorial gift. The primary purpose for which the income should be spent is usually one of special interest to the donor and one that he believes will be especially useful for the Faculty Library.

The following provision may be added to a bequest

Selected Medical Literature Searches

The following are among the computerized medical literature searches provided to members of Med-Chi during the month of March, 1979:

1. Intelligence testing in Europe	40	citations
2. Amyloidosis and the larynx	12	"
3. Alcoholism and the college student	20	"
4. Surgery for scoliosis	54	"
5. Chlamydia infections in infants	40	"
6. Management of achalasia	14	"
7. Controlling fever in children	40	"
8. Digitalis glycosides poisoning	32	"
9. Chromium levels in the blood	10	"
10. Compulsive gambling	10	"

If you would like a copy of one of these searches, or would like to have a search on any biomedical topic, call or write the Library.

ADAM SZCZEPANIAK, JR.
Assistant Librarian

in the form of 2 or 3: "If it is found by the Library Committee that all or part of the income cannot be used to the best advantage for the above purpose, then all, or any balance of the income not so expended, may be used for any purpose that is within the corporate powers of the Faculty and approved by the Library Committee."

This paragraph, sometimes called an "escape clause," allows for unexpected changes in conditions that may occur over a long period and may make it unwise, or even impossible, to continue to apply all or any of the income to the primary purpose. With this "escape clause," income that cannot be wisely-spent for the primary purpose will be spent for some other useful end.

Taxes

Under the present law, bequests made to the Faculty Library in any of the foregoing forms are fully-deductible in computing the net estate of the testator, subject to the Federal estate tax. The law of the state where the donor resides at the time of his or her death determines the extent to which the bequests are deductible from state and inheritance taxes. A deduction in computing the Federal estate tax is often very valuable; in the case of a large estate, the deduction of a bequest may reduce the Federal estate tax by more than half the value of the gift.

For more information regarding the inclusion of the Faculty Library in your will, and for suggestions as to needs of the Library that would be helped by a bequest, contact the Faculty Librarian.

Discipline Commission Action

Editor's Note: On instruction of the Council of the Medical and Chirurgical Faculty of the State of Maryland, "Findings of Fact, Conclusions of Law and Order" will be published in the JOURNAL, as cases become final.

IN THE MATTER OF DONALD EDGREN, MD, BEFORE THE
COMMISSION ON MEDICAL DISCIPLINE OF MARYLAND

FINDINGS OF FACT, CONCLUSIONS OF LAW AND ORDER

Upon certain information coming to its attention, pursuant to Article 43, Section 130 of the Annotated Code of Maryland, the Commission on Medical Discipline initiated an investigation into the medical practice of the Respondent, Donald Edgrin, MD. Therefore, the Commission determined to charge the Respondent with certain violations of the Code. The violations charged involved the following subsection of Article 43, Section 130 (h):

(18) Professional and mental incompetence.

Appropriate notice of the charge and the grounds from which it arose was given to Respondent and a hearing to consider said charge was scheduled before the Commission on May 16, 1978. Prior to the date of the hearing, conversations took place between Richard Kovelant, Esq., counsel for Dr. Edgrin, and Stephen J. Sfikas, Assistant Attorney General, counsel to the Commission, concerning the possibility of reaching a mutually-agreeable consent decree. As a result of those conversations, and other discussions, consultations, physicians' reports and findings, the Commission has determined to enter into the following Consent Order with the Respondent.

FINDINGS OF FACT

The Commission finds:

1. That the Respondent's mental condition has interfered with his ability to practice medicine in a competent fashion.
2. That the Respondent has undertaken on his own, to seek psychiatric assistance and the Respondent has indicated his willingness to continue under psychiatric treatment and to submit to regular peer review of his practice.
3. While acknowledging the validity of the Order, the Respondent does not concede the validity of the charges against him or the correctness of the Commission's Findings of Fact or Conclusions of Law.

CONCLUSIONS OF LAW

Upon the foregoing Findings of Fact, the Commission concludes as a matter of law that due to the Respondent's mental condition he was not capable of the competent practice of medicine and the Commission adjudicates the Respondent GUILTY of mental incompetence.

ORDER

Upon the foregoing Findings of Fact and Conclusions of Law, it is this 16th day of May, 1978, by the unanimous vote of the Commission on Medical Discipline

ORDERED that the license to practice medicine in the State of Maryland previously issued to Respondent be, and the same is hereby SUSPENDED for a period of two years from the date of this order; and be it further

ORDERED that this Suspension be STAYED with Respondent placed on PROBATION upon the following terms and conditions:

- 1) That the Respondent continue in a program of psychiatric treatment with a psychiatrist acceptable to the Commission;
- 2) That the Respondent and his psychiatrist shall have at least one psychiatric session every other week, or as otherwise directed by his psychiatrist;
- 3) That the Respondent's psychiatrist shall report to the Commission on a quarterly basis as to the Respondent's progress in treatment.
- 4) That the Respondent shall make satisfactory progress in his course of treatment;
- 5) That the Respondent's treatment shall continue until such time as the Commission, in consultation with Respondent's psychiatrist, shall determine that psychiatric treatment is no longer necessary;

6) That the Respondent shall submit to peer review by the Commission or its agents on a monthly basis;

7) That the Commission's agent shall provide the Commission with reports as to the quality of the Respondent's practice;

8) That the Respondent's practice shall be in accord with those standards expected from a competent practitioner of medicine in the State of Maryland; and be it further

ORDERED that each year from the date of this Order the Commission shall review the terms of this Order to determine what, if any, modification might be appropriate in light of the Respondent's progress, provided however Respondent can be permitted to petition for earlier review; and be it further

ORDERED that if the Respondent has demonstrated a cure for his illness and satisfactory practice, three years following the date of this Order the Commission shall terminate Respondent's probationary status and upon such occurrence this Order shall be of no further effect, provided that the Commission may in its discretion terminate Respondent's probationary status sooner than three years if the Commission is satisfied with his progress; and be it further

ORDERED that should Respondent violate any of the foregoing terms and conditions, upon notification by and a hearing before the Commission, the Stay of Suspension shall be withdrawn and Respondent's license shall be SUSPENDED for two years; and be it further

ORDERED that a copy of this Order be filed with the Board of Medical Examiners in accordance with the Annotated Code of Maryland, Article 43, Section 130 (m).

JOHN E. ADAMS, MD

Chairman

Commission on Medical Discipline of Maryland

CONSENT

By this Consent, I hereby accept and submit to the foregoing

DRINKING PROBLEM?

Or do you know of any associates
who may have a problem?

Please come join the Baltimore area
doctors who are recovering in alcohol-
ics anonymous.

There is a closed doctors' AA meeting
at 8:30 PM each Thursday at 309 Cathed-
ral St., Baltimore (turn right immedi-
ately after entering the front door).

**"Anonymity is the Spiritual
Foundation of Our Program"**

"Sorry I'm late. I cut myself shaving this morning."

Order and its conditions. I acknowledge the validity of the Order as if made after a hearing at which I would have had the right to counsel, to confront witnesses, to give testimony and to call witnesses in my own behalf, and to all other substantive and procedural protections provided by law. I also recognize that I am waiving my rights to appeal any adverse ruling of the Commission that might have followed any such hearing. By this Consent, I waive all such rights and acknowledge that by my failure to abide by the conditions of my probation, I may suffer the suspension of my license to practice medicine in Maryland.

Although I recognize the validity of this Order and consent to its terms, I do not admit to the validity of any of the charges against me or to the correctness of the Commission's Findings of Fact or Conclusions of Law.

I sign this Consent without reservation, fully understanding its meaning and after consultation with my counsel.

DONALD EDGRIN, MD
STATE OF MARYLAND

I HEREBY CERTIFY, that on this 16th day of May, 1978, before me, the subscriber, personally appeared DONALD EDGRIN, MD, and he made oath in due form of law that the foregoing Consent is his voluntary act and deed.

AS WITNESS my hand and Notarial Seal.

Main Office: Charles and Baltimore Sts. and 20 other convenient locations.

*Based on contributions of \$1500 the first of each year earning 8% interest annually and assuming the rate remains constant.

Medical Miscellany

Mathias says President's 1980 Budget Gives National Institutes of Health "A Raw Deal"

Sen. Charles McC. Mathias, Jr. (R,MD) says the National Institutes of Health have been given "A raw deal in the President's 1980 budget."

In a recent address to the Annual Meeting of the Interassembly Council of Scientists of the National Institutes of Health at Bethesda, MD, the Maryland senior Senator declared: "In absolute terms, the Administration's fiscal year '80 budget request for NIH of \$3.172 billion is slightly below the FY '79 budget, and if you figure in the toll inflation takes, it is well below the FY '79 level."

"Last week we heard testimony in the Senate Labor HEW Appropriations Subcommittee forecasting that the new NIH budget means about an 8% cut in research funds."

"I think that estimate is conservative. I think the cut will be much higher than that unless we do something about it."

According to Sen. Mathias, "One of the most short-sighted aspects of the President's FY '80 budget request is his proposal to rescind the \$37 million Congress appropriated last year for a new building for the National Institute of Child Health and Human Development. I would hate to have to choose between competing research priorities, but certainly a good case can be made for giving priority to programs directed at improving child health."

Biomedical research, the Senator emphasized, "Should be right up with defense at the top of any list of national spending priorities . . . Obviously, one of the most unproductive ways to respond to Proposition 13 pressure for economy in government would be to short-change biomedical research. The one sure way to make

this country go broke is to send more people to the hospital, and one sure way to balance the budget is to find ways of preventing disease."

He also stated: "You can almost prove mathematically that for every dollar spent by NIH, society will save \$20 in reduced health care costs and increased human productivity."

"We've got a fine example of cost-effectiveness in the health field here in Maryland in our very successful immunization campaign against measles. In 1976, the State registered 718 cases of measles; in 1977, the number of cases was down, but still too high, at 399 cases but last year, as a result of the nationwide effort to immunize children initiated by the Center for Disease Control, Maryland registered only 51 cases of measles. This program has more than justified itself in terms of dollars and cents savings. When you factor in the human agony avoided, the lowered incidence of birth defects, of deafness and blindness, the savings are literally incalculable."

"I have also been very impressed by the statistics the National Cancer Institute has produced showing that the economic loss to the nation because of cancer is between \$15-\$25 billion annually. Beside those figures \$3 billion seems, and is, ridiculously little to spend on biomedical research."

"Every time we get a new OMB director, I make the same pitch. I've recommended to all of them that they visit NIH and see what a tremendous asset they have in this operation. I tell them you've got four Nobel laureates out here and 14 more associated with NIH but even that doesn't tempt them to lay aside their pruning shears long enough to take a look at an operation that really saves them money. Not one OMB Director in the lot has even responded to my invitation. Mr. McIntyre, at least, promised me that he would make an official visit to NIH, but I'm still waiting for him to keep that promise. I hope he will. It would be an eye-opening experience for him."

"Of course, no one really needs to come out here to find out that we're getting a high return on the money we've invested in biomedical research. You can learn that just from reading the newspapers. The data on the dramatic decline in the stroke death rate released by the National Heart, Blood and Lung Institute two weeks ago speaks for itself. A 36% decline in the stroke death rate since 1962 is a handsome return on our investment by any standard. I congratulate you on another job well done, but, although I rejoice along with everyone else when you produce a major breakthrough of this sort, I don't clamor for quick results. I know that it takes many years for basic research to have its full impact, and the results are well worth the wait. As the policymaking board of the National Science Foundation recently pointed out to President Carter: "One third of the growth in the national income during the postwar period flowed from advances in knowledge particularly in the sciences and the new technologies to which they give rise. This is a peerless record." □

SEN. MATHIAS

Coming in the Journal:

Doctor vs. Lawyer: Why It Cannot Be Done in Maryland
by John F. King, Esq. and M. Bradley Hallwig, Esq.

Medical Records Safeguards Proposed in Privacy Amendment

Warning that widespread use of computers poses a threat to the privacy of Americans, US Senator Charles McC. Mathias, Jr. (R-MD) recently proposed legislation to protect a patient's medical records from unwarranted scrutiny.

Mathias joined other Senators in cosponsoring an amendment to the Privacy Act of 1974. The bill, Mathias said, "Strikes the proper balance between the legitimate needs of certain public and private organizations to have access to medical records, and the individual patient's rights to privacy."

The bill's most important feature, he said, corrects a situation in which a patient is often the one person who cannot see his medical record. Under the bill, patients would have the right to see their records and to correct a portion of a record they feel is wrong.

In those instances where the health facility declines to show the patient his record because this would be harmful to him, the patient would have the right to appoint a representative to see the record.

In general, the bill would require that a patient give his consent before his medical record could be disclosed to a third party, but it also provides for what Mathias called "reasonable disclosures" without the patient's consent—for example, to employees, auditors and others who work with the health provider, and to rescue workers in the event of a medical emergency. Where a law enforcement agency seeks access to a patient's record by subpoena, the agency generally must notify the patient to give him a chance to contest the action.

The bill's provisions would cover hospitals, nursing homes, clinics and other institutions that participate in Medicare and Medicaid. Physicians who practice in groups of two or more would also be covered, but the individual family doctor would be exempt. "In most cases, his own discretion and his close relationship with his patients are sufficient assurance that their privacy will be respected," Mathias said.

Mathias said the legislation "Is essential to assure that the protections we require as a free people are provided by all institutions. The sanctity of medical records must be preserved if another one of our precious freedoms is not to be whittled away." □

June 20, Psychopharmacotherapy Update, talk by Frank J. Ayd, Jr., MD, Dir. Prof. Educ. and Research, Taylor Manor Hosp. and Clinical Professor, Dept. of Behavioral Med. and Psych., WV Univ. Med. Ctr., Charleston, WV.

University of Maryland

June 15-16, Symposium on Head and Neck Carcinomas. For more data, call (301) 528-3956.

June 21-23, Dermatology Days. Call above number for details.

Other Maryland Meetings

An **Alcohol Education Course** is offered free to the public each Wednesday evening throughout the year by Sheppard Pratt Hospital in Towson, MD. The weekly sessions are held at 7 PM in Rm. 305 of the Hospital's Central Building. The course is designed to increase public awareness about alcohol use and abuse, and alcohol-related problems, and is under the direction of Dick Prodey. The full series runs for nine weeks, but since each session is a complete unit, attendance can begin at any point and then continue for eight consecutive weeks. The course includes lectures and the use of audio-visual aids, with ample time reserved for discussion and questions by participants. The program provides an excellent opportunity to learn more about this important social issue, and interested persons are cordially invited to join the group. For further info., please contact the Hospital's Office of Public Information, (301) 823-8200, exts. 247 or 257.

June 13, 8th Annl. Membership Buffet-Supper Mtg. and Volunteer Awards Presentation of Central MD Chapter, Amer. Heart Assn., 17 E. Mt. Vernon Pl., Balto., beginning 6 PM. For details, call (301) 685-7074. □

Doctors in the News

Programs on Early Years at Hopkins

Two programs of informal memoirs on the early years at Hopkins and some of the doctors who helped shape the institution were presented by the Johns Hopkins Medical History Club recently in the Doctors' Dining Room of the Hospital.

One focused on Dr. William H. Welch, first fulltime member of the Johns Hopkins medical faculty, one of the academic architects of the School of Medicine, and the first Director of the School of Hygiene and Public Health. Dr. Vic-

tor A. McKusick, Director of the Department of Medicine, introduced a film of Dr. Welch, and comments were given by Dr. George W. Corner, Professor Emeritus of Embryology, and former Executive Officer of the American Philosophical Society. Dr. Corner's many scientific achievements include the discovery of the hormone progesterone.

Attention was also turned to Hopkins in the 1920s. Dr. Thomas B. Turner, Dean Emeritus of the medical faculty, introduced a film of Dr. J.J. Abel, first Professor of Pharmacology at Hopkins, describ-

ing his development of the artificial kidney. Reminiscences of Dr. Abel and other leading figures of the Hopkins faculty were given by Drs. Warfield M. Firor, Richard W. TeLinde and Charles W. Wainwright, Professors Emeriti of Surgery, Gynecology and Medicine respectively.

The programs were cosponsored by the Medical History Club and by the Committee on Cultural and Social Affairs.

Dr. Rappeport Named

The American Board of Forensic Psychiatry, Inc., at the recent meeting in Los Angeles, announced that Dr. Jonas R. Rappeport of Baltimore has been named a certified Diplomate in Forensic Psychiatry.

POOLSCAPING . . . "Total Swimming Pool Environment Planning"

Taking the swimming pool plunge alone can be a very traumatic experience. There are many aspects of swimming pool planning and building that you will know little about. Your swimming pool environment "Poolscape" needs professional thought and creativity. Proper planning can save you headaches and money.

We can help you get the most out of your "Poolscape." Our program includes helping you design and build your pool, pool decking, retaining walls, terraces, walks, fencing, grading, pool houses and plantings. We can help you go from an empty back yard to a creative and functional "Poolscape."

Call Us Today & Let's Get Started On Your "Poolscape."

"Swimming Pool Design & Installation Is One Of Our Specialties."

South Baltimore General Hospital Dedicates Herman L. Gruehn Building

Dedication ceremonies for South Baltimore General Hospital's Herman L. Gruehn Building were held recently on the hospital grounds overlooking Baltimore's waterfront (see picture below.)

The new, five-story, \$5.3 million building provides space for the Hospital's licensed School of Practical Nursing, housestaff quarters, in-service educational facilities, offices for nearly 20 private physicians and a 200-seat educational auditorium for the continuing education of the attending Medical Staff.

It also completes the Hospital's original design capacity of 534 beds.

The Building is named in honor of Herman L. Gruehn, a Past President of the Hospital's Board.

Mr. Gruehn was instrumental in the enactment of the Maryland Hospital Loan Act of 1964, which enabled numerous hospitals, including South Baltimore General, to expand or replace outmoded facilities and provide expanded health services to the citizens of Maryland.

He also was chairman of the special blue ribbon Commission to Study Hospital Costs appointed by then-Gov. J. Millard Tawes in 1964.

In 1970, Gruehn helped write the formula for a State regulation which led to the creation of the Hospital Services Cost Review Commission.

Notice to All Physicians

The private physician being one of the major source who refers patients to the John F. Kennedy Institute in Baltimore, let it be known to all concerned that the Kennedy Institute complies with Title VI of the Civil Rights Act of 1967 in that all admissions, treatments and accommodation assignments, to both inpatient and outpatients, are made without regard to race, color, creed or country or national origin. Furthermore, no applicant for employment, both professional and non professional, shall be denied employment on the basis of sex, race, age, creed, color, nor handicap in any job for which he or she is qualified. ☐

Only Jobst supports are custom made from precise measurements of the individual extremity.

Jobst® Venous Pressure Gradient® Supports

These measured, custom-made therapeutic elastic supports have carried the Jobst name to the four corners of the world. Prescription only, the supports can be engineered with counterpressures of 25, 30, 40 or 50 mm.Hg at the ankle, decreasing proximally along the venous pressure gradient. They are available in knee-length, full-leg, waist-height and lymphedema sleeve styles. The waist-height Jobst Pregnancy Leotard deserves special mention because each one is custom made with an expandable panel according to the patient's own measurements.

Contact your local Jobst Service Center for complete details.

Dr. Tabatznik Speaks to Cardiology Conference

Dr. Bernard Tabatznik, chief of the Department of Cardiology at North Charles General Hospital, addressed the cardiological department conference recently in the Hospital's William Schuman Lecture Hall at Charles and 28th

BERNARD TABATZNIK, M.D.

Streets in Baltimore.

The subject of the conference was Synscope.

Dr. Stephen P. Cohen Appointed Urologist-in-Chief at Sinai

Dr. Stephen P. Cohen has been appointed Urologist-in-Chief at Baltimore's Sinai Hospital, it was announced recently by **Spencer Foreman, MD**, Executive Vice President. Dr. Cohen succeeds **Dr. Martin A. Robbins**, who had served as head of the Department since 1961. Dr. Robbins continues in private practice.

Until his appointment, Dr. Cohen had served as Associate Chief of Urology at Sinai. Prior to that, he was Chief of the Division of Urology at North Charles General Hospital, also in Baltimore.

Born in Patterson, NJ, Dr. Cohen received his bachelor's degree from Middlebury College in Vermont and his Medical Degree

from the University of Maryland School of Medicine. He served both his internship and residency at Sinai and has been an active member of its medical staff since then.

A member of many professional societies and the author of several medical papers, Dr. Cohen is certified by the American Board of Urology. He is President of the Maryland Urological Society.

"Parental Burn-Out" Discussed

The St. Agnes Hospital Department of Pediatrics in Baltimore recently held evening class and discussion for the parents of children with learning and behavior problems. The topic of discussion was **Parental Burn-Out**.

All interested persons, including teachers, nurses, physicians, neighbors and friends were invited to attend the free class.

Participating in the discussion were members of the St. Agnes Hospital staff: **Dr. Gregory Fernando**, Child Psychiatrist, and **Dr. Anil Kumar**, Pediatric Fellow, Ambulatory Care and School Health Program.

A simple solution for beating the high cost of feeding babies.

Powdered Soyalaac mixed with water (according to directions on the label) is an inexpensive, soy-based infant formula your patients can buy.

Up to 50% less expensive than ready-to-serve formulas.

Up to 25% less expensive than liquid concentrates, including our own!

Soyalaac is the only leading milk-free infant formula available as an inexpensive powder. It provides exactly the same nutritional balance as Soyalaac's con-

centrated and ready-to-serve infant soy formulas — at a fraction of the cost.

Your patients who use formula will appreciate knowing about it.

For detailed information and samples, please call or write the Soyalaac sales representative in your area.

NEOSPORIN
OINTMENT

POLYMYXIN B-BACITRACIN-
TOPIICAL ANTIBACTE

NEOSPORIN
OINTMENT

NEOSPORIN
POLYMYXIN B-BACI
TOPIICAL ANT

NEOSPORIN[®] Ointment

(Polymyxin B-Bacitracin-Neomycin)

Burroughs Wellcome Co.
Research Triangle Park
North Carolina 27709

Ointment may be used to prevent bacterial contamination in burns, skin grafts, incisions, and other clean lesions. For abrasions, minor cuts and wounds accidentally incurred, its use may prevent the development of infection and permit wound healing.

CONTRAINDICATIONS: This product is contraindicated in those individuals who have shown hypersensitivity to any of its components. Do not use in the eyes or in the external ear canal if the eardrum is perforated.

WARNING: Because of the potential hazard of nephrotoxicity and ototoxicity due to neomycin, care should be exercised when using this product in treating extensive burns, trophic ulceration and other extensive conditions where absorption of neomycin is possible. In burns where more than 20 percent of the body surface is affected, especially if the patient has impaired renal function or is receiving other aminoglycoside antibiotics concurrently, not more than one application a day is recommended.

When using neomycin-containing products to control

secondary infection in the chronic dermatoses, it should be borne in mind that the skin is more liable to become sensitized to many substances, including neomycin. The manifestation of sensitization to neomycin is usually a low grade reddening with swelling, dry scaling and itching; it may be manifest simply as failure to heal. During long-term use of neomycin-containing products, periodic examination for such signs is advisable and the patient should be told to discontinue the product if they are observed. These symptoms regress quickly on withdrawing the medication. Neomycin-containing applications should be avoided for that patient thereafter.

PRECAUTIONS: As with other antibacterial preparations, prolonged use may result in overgrowth of nonsusceptible organisms, including fungi. Appropriate measures should be taken if this occurs.

ADVERSE REACTIONS: Neomycin is a not uncommon cutaneous sensitizer. Articles in the current literature indicate an increase in the prevalence of persons allergic to neomycin. Ototoxicity and nephrotoxicity have been reported (see Warning section).

Complete literature available on request from Professional Services Dept. PML.

Each gram contains: Neosporin[®] (Polymyxin B Sulfate) 5,000 units, bacitracin zinc 400 units, neomycin sulfate 5 mg (equivalent to 3.5 mg neomycin base), special white petrolatum qs; in tubes of 1 oz and 1/2 oz and 1/32 oz (approx.) foil packets.

INDICATIONS: *Therapeutically*, (as an adjunct to systemic therapy when indicated), for topical infections, primary or secondary, due to susceptible organisms, as in: infected burns, skin grafts, surgical incisions, otitis externa; primary pyoderma (impetigo, ecthyma, sycosis vulgaris, paronychia); secondarily infected dermatoses (eczema, herpes, and seborrheic dermatitis); traumatic lesions, inflamed or suppurating as a result of bacterial infection. *Prophylactically*, the

able to do more...**

with symptomatic relief of moderate anxiety with depression

Rapid relief of the symptoms of moderate anxiety in many patients

The tranquilizer component alleviates symptoms of anxiety and agitation within a few days, without apparent dulling of mental acuity. Hypnotic effects from the tranquilizer component appear to be minimal, particularly in patients permitted to remain active. However, TRIAVIL may impair mental and/or physical abilities required for the performance of hazardous tasks.

Highly effective antidepressant action

The antidepressant component relieves symptoms of depression such as poor concentration and feelings of hopelessness as well as early morning awakening; adequate relief of symptoms may take a few weeks or even longer.

Increased activity potential often results from symptomatic relief

As the symptoms of anxiety and depression respond to TRIAVIL, many patients may show renewed interest in family and recreational activities and are able to function more effectively at work.

More prescribing convenience

For optimal flexibility there are now *five* tablet strengths of TRIAVIL for ease of dosage adjustment. For initial management of patients with moderate anxiety and depression, one TRIAVIL® 2-25, containing 2 mg perphenazine and 25 mg amitriptyline HCl, t.i.d. may often be adequate. TRIAVIL® 4-50, containing 4 mg perphenazine and 50 mg amitriptyline HCl, provides b.i.d. convenience for those patients needing the larger total daily dose of 8 mg perphenazine and 100 mg amitriptyline HCl as initial or maintenance therapy.

Treatment with TRIAVIL—a balanced view:

TRIAVIL is contraindicated in CNS depression from drugs, in the presence of evidence of bone marrow depression, and in patients hypersensitive to phenothiazines or amitriptyline. It should not be used during the acute recovery phase following myocardial infarction or in patients who have received an MAOI within two weeks. Patients with cardiovascular disorders should be watched closely. Not recommended in children or during pregnancy. TRIAVIL may impair mental and/or physical abilities required for performance of hazardous tasks and may enhance the response to alcohol. Antiemetic effect may obscure toxicity due to overdosage of other drugs or mask other disorders. The possibility of suicide in depressed patients remains until significant remission occurs. Such patients should not have access to large quantities of the drug. Hospitalize as soon as possible any patient suspected of having taken an overdose.

MSD
MERCK
SHARP
&
DOHME

*Please see following page
for a brief summary
of prescribing information.*

For moderate
anxiety with depression
dual-action
Triavil®

containing perphenazine and amitriptyline HCl

More dosage strengths
than any other formulation containing
a tranquilizer and an antidepressant

Dual-action Triavil®

containing perphenazine and amitriptyline HCl

Available:

TRIAVIL® 2-25: Each tablet contains
2 mg perphenazine and 25 mg amitriptyline HCl.
TRIAVIL® 2-10: Each tablet contains
2 mg perphenazine and 10 mg amitriptyline HCl.
TRIAVIL® 4-50: Each tablet contains
4 mg perphenazine and 50 mg amitriptyline HCl.
TRIAVIL® 4-25: Each tablet contains
4 mg perphenazine and 25 mg amitriptyline HCl.
TRIAVIL® 4-10: Each tablet contains
4 mg perphenazine and 10 mg amitriptyline HCl.

CONTRAINDICATIONS: Central nervous system depression from drugs (barbiturates, alcohol, narcotics, analgesics, antihistamines); evidence of bone marrow depression; known hypersensitivity to phenothiazines or amitriptyline. Should not be given concomitantly with a monoamine oxidase inhibitor since hyperpyretic crises, severe convulsions, and deaths have occurred from such combinations. When used to replace a monoamine oxidase inhibitor, allow a minimum of 14 days to elapse before initiating therapy with TRIAVIL. Therapy should then be initiated cautiously with gradual increase in dosage until optimum response is achieved. Not recommended for use during acute recovery phase following myocardial infarction.

WARNINGS: TRIAVIL should not be given concomitantly with guanethidine or similarly acting compounds since TRIAVIL may block the antihypertensive action of such compounds. Use cautiously in patients with history of urinary retention, angle-closure glaucoma, increased intraocular pressure, or convulsive disorders. Dosage of anticonvulsive agents may have to be increased. In patients with angle-closure glaucoma, even average doses may precipitate an attack. Patients with cardiovascular disorders should be watched closely. Tricyclic antidepressants, including amitriptyline HCl, have been reported to produce arrhythmias, sinus tachycardia, and prolongation of conduction time, particularly in high doses. Myocardial infarction and stroke have been reported with tricyclic antidepressant drugs. Close supervision is required for hyperthyroid patients or those receiving thyroid medication. May impair mental and/or physical abilities required for performance of hazardous tasks, such as operating machinery or driving a motor vehicle. In patients who use alcohol excessively, potentiation may increase the danger inherent in any suicide attempt or overdosage. Not recommended in children or during pregnancy.

PRECAUTIONS: Suicide is a possibility in depressed patients and may remain until significant remission occurs. Such patients should not have access to large quantities of this drug.

Perphenazine: Should not be used indiscriminately. Use with caution in patients who have previously exhibited severe adverse reactions to other phenothiazines. Likelihood of some untoward actions is greater with high doses. Closely supervise with any dosage. The antiemetic effect of perphenazine may obscure signs of toxicity due to overdosage of other drugs or make more difficult the diagnosis of disorders such as brain tumor or intestinal obstruction. A significant, not otherwise explained, rise in body temperature may suggest individual intolerance to perphenazine, in which case discontinue.

If hypotension develops, epinephrine should not be employed, as its action is blocked and partially reversed by perphenazine. Phenothiazines may potentiate the action of central nervous system depressants (opiates, analgesics, antihistamines, barbiturates, alcohol) and atropine. In concurrent therapy with any of these, TRIAVIL should be given in reduced dosage. May also potentiate the action of heat and phosphorous insecticides. There is sufficient experimental evidence to conclude that chronic administration of antipsychotic drugs which increase prolactin secretion has the potential to induce mammary neoplasms in rodents under the appropriate conditions. There are recognized differences in the physiological role of prolactin between rodents and humans. Since there are, at present, no adequate epidemiological studies, the relevance to human mammary cancer risk from prolonged exposure to perphenazine and other antipsychotic drugs is not known.

Amitriptyline: In manic-depressive psychosis, depressed patients may experience a shift toward the manic phase if they are treated with an antidepressant. Patients with paranoid symptomatology may have an exaggeration of such symptoms. The tranquilizing effect of TRIAVIL seems to reduce the likelihood of this effect. When amitriptyline HCl is given with anticholinergic agents or sympathomimetic drugs, including epinephrine combined with local anesthetics, close supervision and careful adjustment of dosages are required. Paralytic ileus may occur in patients taking tricyclic antidepressants in combination with anticholinergic-type drugs.

Caution is advised if patients receive large doses of ethchlorvynol concurrently. Transient delirium has been reported in patients who were treated with 1 g ethchlorvynol and 75-150 mg of amitriptyline HCl.

Amitriptyline HCl may enhance the response to alcohol and the effects of barbiturates and other CNS depressants.

Concurrent administration of amitriptyline HCl and electroshock therapy may increase the hazards associated with such therapy. Such treatment should be limited to patients for whom it is essential. Discontinue several days before elective surgery if possible. Elevation and lowering of blood sugar levels have both been reported. Use with caution in patients with impaired liver function.

ADVERSE REACTIONS: Similar to those reported with either constituent alone. **Perphenazine:** Extrapyramidal symptoms (opisthotonus, oculogyric crisis, hyperreflexia, dystonia, akathisia, acute dyskinesia, ataxia, parkinsonism) have been reported and can usually be controlled by the concomitant use of effectively antiparkinsonian drugs and/or by reduction in dosage, but sometimes persist after discontinuation of the phenothiazine.

Tardive dyskinesia may appear in some patients on long-term therapy or may occur after drug therapy with phenothiazines and related agents has been discontinued. The risk appears to be greater in elderly patients on high-dose therapy, especially females. Symptoms are persistent and in some patients appear to be irreversible. The syndrome is characterized by rhythmical involuntary movements of the tongue, face, mouth, or jaw. Involuntary movements of the extremities sometimes occur. There is no known treatment for tardive dyskinesia. Antiparkinsonian agents usually do not alleviate the symptoms. It is advised that antipsychotic agents be discontinued if the above symptoms appear. If treatment is instituted, or dosage of the particular drug increased, or another drug substituted, the syndrome may be masked. Fine vermicular movements of the tongue may be an early sign of the syndrome. The full-blown syndrome may not develop if medication is stopped when lingual vermiculation appears.

Other side effects are skin disorders (photosensitivity, itching, erythema, urticaria, eczema, up to exfoliative dermatitis); other allergic reactions (asthma, laryngeal edema, angioneurotic edema, anaphylactoid reactions); peripheral edema; reversed epinephrine effect; hyperglycemia; endocrine disturbance (lactation, galactorrhea, gynecomastia, disturbances of menstrual cycle); altered cerebrospinal fluid proteins; paradoxical excitation; hypertension, hypotension, tachycardia, and ECG abnormalities (quinidine-like effect); reactivation of psychotic processes; catatonic-like states; autonomic reactions, such as dry mouth or salivation, headache, anorexia, nausea, vomiting, constipation, obstipation, urinary frequency or incontinence, blurred vision, nasal congestion, and a change in pulse rate; other adverse reactions reported with various phenothiazine compounds, but not with perphenazine, include grand mal convulsions, cerebral edema, polyphagia, pigmentary retinopathy, photophobia, skin pigmentation, and failure of ejaculation.

The phenothiazine compounds have produced blood dyscrasias (pancytopenia, thrombocytopenic purpura, leukopenia, agranulocytosis, eosinophilia, and liver damage (jaundice, biliary stasis).

Pigmentation of the cornea and lens has been reported to occur after long-term administration of some phenothiazines. Although it has not been reported in patients receiving TRIAVIL, the possibility that it might occur should be considered.

Hypnotic effects, lassitude, muscle weakness, and mild insomnia have also been reported.

Amitriptyline: Note: Listing includes a few reactions not reported for this drug, but which have occurred with other pharmacologically similar tricyclic antidepressant drugs and must be considered when amitriptyline is administered. **Cardiovascular:** Hypotension; hypertension; tachycardia; palpitation; myocardial infarction; arrhythmias; heart block; stroke. **CNS and Neuromuscular:** Confusional states; disturbed concentration; disorientation; delusions; hallucinations; excitement; anxiety; restlessness; insomnia; nightmares; numbness, tingling, and paresthesias of the extremities; peripheral neuropathy; incoordination; ataxia; tremors; seizures; alteration in EEG patterns; extrapyramidal symptoms; tinnitus; syndrome of inappropriate ADH (antidiuretic hormone) secretion. **Anticholinergic:** Dry mouth; blurred vision; disturbance of accommodation; increased intraocular pressure; constipation; paralytic ileus; urinary retention; dilatation of urinary tract. **Allergic:** Skin rash; urticaria; photosensitization; edema of face and tongue. **Hematologic:** Bone marrow depression including agranulocytosis; leukopenia; eosinophilia; purpura; thrombocytopenia. **Gastrointestinal:** Nausea; epigastric distress; vomiting; anorexia; stomatitis; peculiar taste; diarrhea; parotid swelling; black tongue. Rarely hepatitis (including altered liver function and jaundice). **Endocrine:** Testicular swelling and gynecomastia in the male; breast enlargement and galactorrhea in the female; increased or decreased libido; elevated or lowered blood sugar levels. **Other:** Dizziness, weakness; fatigue; headache; weight gain or loss; increased perspiration; urinary frequency; mydriasis; drowsiness; alopecia. **Withdrawal Symptoms:** Abrupt cessation after prolonged administration may produce nausea, headache, and malaise. These are not indicative of addiction.

OVERDOSAGE: All patients suspected of having taken an overdosage should be admitted to a hospital as soon as possible. Treatment is symptomatic and supportive. However, the intravenous administration of 1-3 mg of physostigmine salicylate is reported to reverse the symptoms of tricyclic antidepressant poisoning. Because physostigmine is rapidly metabolized, the dosage of physostigmine should be repeated as required particularly if life-threatening signs such as arrhythmias, convulsions, and deep coma recur or persist after the initial dosage of physostigmine. On this basis, in severe overdosage with perphenazine-amitriptyline combinations, symptomatic treatment of central anticholinergic effects with physostigmine salicylate should be considered.

Run—and Don't Look Over Your Shoulder, Part 2

By PHILIP F. WAGLEY, MD

For reprint and other data contact Dr. Wagley at 9 E. Chase St., Balto., MD 21202.

The first article of this series presented a rather panoramic view of certain aspects of running.¹ The current piece supplements that approach. For example, one "rule" has been given about speed of running. Another "rule" frequently used is defined as follows:² If one subtracts one's age from 220 and multiplies the difference by .70 and by .85, one obtains two figures. These are considered as defining the pulse range one should attain in running. For a person of 60, this would be between 112 and 136. A lay person may find this most easily—determined by palpating the carotid instead of the radial artery. A few determinations suffice in providing general guidelines as to how much faster or more slowly one should jog on various terrains. A physician should emphasize the added strain on a runner of a facing wind, the early postprandial period and slight inclines. Any irregularity of the pulse noted during such determinations should be reported. A distance runner develops at rest a slow pulse—not infrequently below 50.

Metabolic Changes

"Interval running" is a frequently-used form of training. There are many variations of this, but the principle is always the same—short bursts of speed alternating with a slow jog for a recovery period. It is in this framework of training where estimation of the pulse range is important. Anaerobic exercise is alternated with aerobic recovery. During the latter the oxygen deficit decreases. As shown in Figure I in the first article¹ one's ability to metabolize lactic acid can be improved with physical training. Such interval spurts are not done while one is running a long distance. In other words, "interval running" should be practiced when shorter daily distances are covered.

Once a week a serious marathoner, while training, may do a "depleting" run. This is a significantly-longer run, one he could not do day after day. In preparation for competitive distance running, a "depleting" training run may be followed by a change in diet, such as a high carbohydrate "loading" diet. The reasoning for this is mentioned below.

In addition to reasons previously given for early morning running, there can be added that of an "empty stomach." Waiting as long as three hours after a meal and then attempting to run impresses one as being quite different than running after an overnight fast. Following the shorter postprandial interval, one's stamina is much less.

It is a surprise to some that running actually suppresses one's appetite. In other words, early morning runs do not lead to any desire for a large breakfast but, on the contrary, decrease one's hunger. Various estimates have been given as to the caloric expenditure by different exercises for certain durations;³ however, reference to suppression of hunger by strenuous activity is not emphasized. This appetite suppression may have an even more significant role in weight-reduction than the rapid expenditure of calories.

There is a degree of fuel "homeostasis" in exercise.⁴ At rest, muscles are dependent primarily on oxidation of fatty acids. With exercise, as oxygen need increases, the skeletal muscles use glycogen as well as more free fatty acids (FFA). During the first few minutes of activity, glycogenolysis increases. With continued exercise, blood-borne substrate is required. Under these circumstances, blood glucose uptake may increase 10-20 times the basal level; however, this accounts for only 30-40% of the total oxygen consumed by the exercising muscle. An additional 40% or more is needed for oxidation of fatty acids. The total body turnover of glucose with severe exercise may increase five fold.⁴ As strenuous contractions continue, the oxygen utilization by glucose rises, but is exceeded by even more free fatty acid (FFA) substrate. This is illustrated in Figure I (this article) based on data by Ahlborg, Felig et al.⁵ Muscle glycogen values in a rested marathoner have been reported two-three times the level found in untrained

FIGURE 1 (from July, 1978 *Journal* article, Part 1): Change in the Blood Lactic Acid and Carbonic Acid Plotted after Various Degrees of Physical Effort as Determined by the Oxygen Consumption in Liters Used per Minute. The lack of much change in either blood lactic acid or carbonic acid in the case of DeMar, the marathoner, is to be contrasted with a "control" 25 years of age. Data reported by Bock and Currens and White. Modified presentation of data.

muscles.⁶ It is on this basis that carbohydrate “loading” or “packing” is practiced.⁷ (The historical background and the pros and cons of such dietary management will be discussed in a later paper.)

Musculoskeletal Problems

The literature on running contains much about musculoskeletal problems. The knees, ankles and feet seem to be vulnerable and limiting factors frequently. Interestingly, the hip joint is mentioned relatively rarely. Although one thinks of all these joints as weight-bearing articulations, it is obvious the hip bears significantly-less weight than do the others on impact. The leg itself makes up a high percentage of the total body weight. In jogging, each hip is spared on impact the weight of its “own” leg, so to speak.

Because a run of one or two miles sometimes seems needed to “loosen up,” much emphasis is given to preliminary stretching exercises. The author thinks there are limitations to such, however. Some are really contortions with joints placed in extreme positions. The would-be-runner then stretches from such positions with body weight being moved forcefully. Such stretching can be painful and possibly harmful. Most such exercises are to stretch the hamstring and gastrocnemius soleus muscles. One simple exercise that seems safe when done slowly is to stand facing a wall (and far enough away to barely touch it) with extended arms. One then slowly leans toward the wall as closely as possible, keeping the feet flat on the floor. A practical outdoor variation is to lean against a car or post and move the legs back, keeping the feet flat on the ground. This can and should be done repeatedly. It avoids the lunging and jerking effects one witnesses so often when people stretch by flexing at the waist or by kicking their feet upward.

A frequent site of discomfort with running is the

FIGURE 1 (current piece): Uptake of oxygen and substrates by the legs during prolonged exercise (reproduced by permission of Felig—see text, current article.)

mid-third of the tibia. So called “shin splints” associated with the area of insertion of the origin of the tibialis anterior and other extensor muscles, may be more traumatic than usual, and due to a stress fracture of the tibia. The X-ray picture of this lesion a few weeks after the pain appears can be very worrisome—suggesting at times an osteogenic sarcoma. Leg amputations have been done as a result of such a mistaken diagnosis. Now that this benign lesion is more readily-identified, such a tragic sequence of therapy does not occur. Happily, the history and a follow-up X-ray clarify the etiology. Rest alone for a short period suffices as therapy.

Most distance runners now absorb the force of impact on the heel—and such is greater than one’s actual weight. It is for this reason that good running shoes have a thick-cushioned heel. Such may be enhanced by what are called orthotics. Each foot will strike the ground several hundred times per mile, the number obviously depending on length of stride. Incidentally, the English word “mile” is derived from the Latin “milia passuum,” meaning a thousand paces or strides. Runners of all long distances tend to land on the outside of the foot and roll medially; however, some distance runners now are becoming “toe runners”—taking the impact more on the front of the foot. This is considered by some the style of the future, providing a softer impact and enhancing a faster pace. As most marathons are run on macadam and cement surfaces, the value of this change in style is evident. With this technique, the foot-arches may suffer additional strain and it will be interesting in the future to determine whether the type of complaints by marathoners will alter.

Johnson, a US Olympic team coach, has described the foot-contact of the great marathoner Frank Shorter.⁸ According to studies, his foot-strike is directly beneath the center of mass and on the outside edge of the ball of the foot with a settling on the heel and rolling full range up and over the toes. Johnson emphasizes attention to “form” in running. He quotes one orthopedic surgeon that 35% of biomechanical injuries result from excessive mileage. Johnson thinks good form is protective.

Cardiac Aspects

The previous paper¹ ended with the question of whether running might be of health value. Pertinent to this is the question: Can atherosclerotic lesions decrease in size? We must keep in mind that the present large “first-generation” of joggers is composed of a high percentage of middleaged individuals who have started the activity quite late in life. For exercise to improve local circulation morphologically, one of two mechanisms must be involved—an increase in calibre of vessels or in number of vessels (or both, of course). The coronaries of DeMar (Mr. Marathon) were of unusually large calibre, and there was an insignificant amount of atherosclerosis.⁸ Bassler has concluded that marathon runners have less coronary atherosclerosis than anticipated.⁹ Blankenhorn¹⁰ has demonstrated that atherosclerotic lesions can be arrested or even diminished in individuals with Type Two and Type Four

lipoproteinemia. Mann et al¹¹ have assumed marathon running had a beneficial effect on coronary arteries. Rehabilitation of some patients who have had myocardial damage has consisted of running programs.¹² These types of observations and opinions and practices have given a sense of "health-security" to marathoners; however, a shocking tragedy in 1973 led to reassessments of risks in running.¹³ That year, the Boston Marathon was run under unusually-hot and humid conditions. A 44-year-old trained participant collapsed after 24 miles. He was resuscitated, but died 50 days later, with an extensive transmural anterior myocardial infarction. The coronary arteries, at autopsy, were free of significant atherosclerosis. It is well-documented that heat-stroke can cause extensive cardiovascular disease.¹⁴ In such cases at autopsy, myocardial damage is usually characterized by patchy necrosis and hemorrhage;¹⁴ however, the lesions may be much more extensive. Knochel¹⁵ has found electrocardiographic evidence of transmural infarction in soldiers with heat-stroke. Of historical interest is the notation that Pheidippides, the original and first-recorded runner of the marathon, fell dead after delivering his message. How much armor he was wearing and how recently he had run over 100 miles to Sparta is unknown.¹⁶

The point to be emphasized is that the "mystique" that marathon running is certain "protection" for the heart must be modified. Obviously, the heart can be damaged in a setting of heat and humidity even when coronary vessels are normal. Therefore, when running, think in terms of "training"—and not "straining." Furthermore, if one does not enjoy running, it will be done too infrequently for any potential benefit, which raises the question of how much running one must do to derive any assumed health effect.

Subsequently the "wall," and why 20 miles is called the "halfway mark" in a marathon race, will be discussed.

Are Billing and Receivables Important to You?

CAS means: **effective patient** **account management**

CAS Provides a "Results" System Tailored to Your Needs

- is designed specifically for group practice management needs;
- is user-controlled and directed for assured accuracy and efficiency;
- can be effectively operated by non-technical administrative personnel;
- provides fast, accurate, reliable billing to all parties;
- provides automatic rebilling and collection follow-up;
- issues timely and effective practice activity reports;
- is kept up-to-date by professional group practice managers;
- improves cash flow;
- increases total collections;
- is fully confidential.

CAS' Staff are experienced Group Practice Managers! We are available for management consultation. We monitor the business practice issues especially those related to third party payors and government units. This monitoring makes it possible for CAS to implement carefully thought-out plans rather than reacting to unnecessary crises.

Our pricing structure is based on our performance and is very competitive; you only pay for the bills, statements and reports produced. We depend on our performance which assures you

peace-of-mind. The CAS System pays for itself!

Headquartered in Baltimore, CAS effectively serves this region by providing its computerized system as a tool for your management or by providing total patient account management services.

For the best results from patient account management, enter into a CAS partnership. Call or write for a free brochure.

I would like more information about how CAS can make my patient account management task easier:

and Jogging, Part 2:

Athlete's Foot Due to Fungus Infection—Foot Rash is Fungus

By FRANK CHAPPELL

Mr. Chappell is Science News Editor of the American Medical Association, 535 N. Dearborn St., Chicago, IL 60610, where he can be contacted for reprint and other data.

The term "athlete's foot" was coined by an advertising man in the early 1930s to promote a patent remedy for fungus infections of the foot.

The popular term is a misnomer, says the AMA. You don't have to be an athlete to have a fungus infection of the foot. Anyone can have it.

Some people are more susceptible than others. A man may have the ailment for years and his wife will remain free of it. Doctors know that most of the efforts to prevent athlete's foot—chlorine footbaths at the swimming pool, disposable slippers, boiling of socks and treatment of shoes—are not helpful. Athlete's foot is almost never "picked up."

The most common form of athlete's foot is that which causes redness, cracks in the skin and itching and burning of the feet, particularly between the toes. The same fungus can cause blister eruptions of the soles of the feet.

Prevention requires that the skin of the feet, especially between the toes, be kept cool and dry. When successfully done, this is more effective than the use of medicated powders, lotions, creams or ointments. Relief may be obtained by simple and bland substances, but a specific approach to treatment will often require the attention of a specialist with laboratory facilities for confirmation. Treatment should be aimed at the type of fungus causing the infection.

Warm, moist skin encourages the growth of all types of fungi. It is difficult to eliminate the fungi entirely, but their effects can be kept under control by keeping the feet cool and dry. □

A HOT TUB IS

SERIOUS RUNNERS RUN ATHLETIC ATTIC

FOR SERIOUS RUNNERS.

Running is our life. Just as it is yours. We are serious runners. We are Marty Liquori, Greg Fredericks, Ken Schappert, Jeff Howser, Mel Pender, Steve Foster, and many more. In fact, the great majority of our stores are managed by accomplished athletes.

We founded Athletic Attic to provide top quality gear to serious runners like ourselves. And like yourself.

We've been to that breaking point. We've run those hundred mile weeks. So when we select a product for our shelves, we go about it very seriously. And we apply our experience thoroughly.

The result — Athletic Attic consistently has the best selection of running shoes and equipment available anywhere. So if you're serious about running at your best, come to Athletic Attic. We've got what you're looking for. Seriously.

The MPP Nurse. A Special Person.

All the nurses who work for Medical Personnel Pool are special. What makes them so special? Being a skilled professional and being associated with other professionals with extremely high standards of excellence. Knowing their skills will be fully utilized by MPP staff's careful assignment matching. And also, very importantly, by being able to devote as much time to their nursing career as they wish without sacrificing their personal lives.

MPP's concept of flexible scheduling allows our employees to work as many hours as they wish or as little on the days and weeks convenient to their individual schedule. Everyone benefits as valuable nursing skills which would otherwise be lost are being provided for patient care.

A flexible schedule is only one of the many benefits that await you when you work for Medical Personnel Pool, one of the most highly respected nursing services in its field. Choice of assignments, extensive insurance coverage including professional and general liability and worker's compensation insurances, in-service education, competitive salary, and a reputation for high standards are just a few of the others.

To learn more about the many opportunities awaiting you at Medical Personnel Pool, stop by your local MPP office.

Drug Hazards

By KENNARD L. YAFFE, MD

Dr. Yaffe was Chairman of the Faculty's Committee on Drugs. He can be reached for reprints and other data at 1211 Cathedral St., Balto., MD 21201.

There continues to be increasing concern among the profession and the general population about the apparent widespread abuse of psychotropic drugs. A recent bulletin from the FDA regarding suicide by Propoxyphene (Darvon) estimates 1,000-2,000 deaths yearly—some related to taking other drugs and/or alcohol at the same time, with or without understanding the danger.

This drug, when taken over an extended period of time, can produce physical and psychological dependence of the morphine type and this may occur in doses not much larger than therapeutic doses.

Because of the concern about this drug, the Committee on Drugs of the Medical and Chirurgical Faculty urges physicians to consider before prescribing Propoxyphene, the following:

1. Is the patient suicidal, prone

to abuse or addiction?

2. Possible dangerous effects if taken along with alcohol, tranquilizers or sedatives.
3. Can a drug with less dangerous potential be substituted?

In addition, I cannot emphasize strongly enough the need for physicians to be aware of the role they may play in inducing addiction. Enormous amounts of psychotropic drugs are being prescribed, too often for trivial problems, in too large quantities and for too long a period of time. It is necessary for us to be cautious each time we prescribe psychotropic drugs—to consider if the drug is necessary—is this problem simply a vicissitude of life that needs to be lived through? If the drug is really necessary, consider the amount prescribed; consider how long it should be maintained and use it for the shortest appropriate time.

We, as physicians, must not take the easiest way unless it is in the best interest of our patient; to do otherwise is to go against the first principle in medicine, "First, Do No Harm."

Medical Miscellany

Children Sought for Insect Sting Allergy Study

Johns Hopkins allergists at Good Samaritan Hospital in Baltimore are seeking youngsters between the ages of 3-16 who have had a rash or generalized itching after an insect sting to participate in an allergy study. The doctors hope to learn how to predict the likelihood of such children's suffering with similar or more serious reactions if stung again.

Participants in the study will receive a free evaluation of their sting sensitivity and advice concerning necessary precautions to take if found allergic. Free treatment with an effective new therapy will be offered to certain participants, along with follow-up examinations and consultations with all participants' physicians.

Interested individuals should call the Allergic Disease Center at (301) 323-2200, ex. 394.

These Pagers Mean Business.

Renting A Beeper?

A significant portion of your monthly charge is for equipment — **not** the actual paging. The rental price includes equipment, paging and maintenance.

Ownership Reduces Monthly Charges

The most practical solution to lowering the monthly charge for paging is to supply your own equipment. In this manner you can save up to \$13.50 **each** month! Coverage and convenience remain the same.

Choosing Your Communications Supplier

Evaluate total costs — purchase price **and** maintenance. Every pager sold by Mountainside has a 3 year parts and labor warranty, assuring you of no hidden extra charges. Whatever your paging needs, whichever features you require, they are available with our equipment.

Certificate of Need: A Physician Concern

By ALBERT M. ANTLITZ, MD and EDWARD BOYER

Dr. Antlitz is Head of the Division of Cardiology at Baltimore's Mercy Hospital, and is a Member of the Executive Committee of the Central Maryland Health Systems Agency. Mr. Boyer is Vice President of Corporate Planning and Program Development of the Maryland Health Care System, Inc. and Former Acting Executive Director of the Central Maryland Health Systems Agency. For reprint and other data, write Dr. Antlitz at 301 St. Paul Pl., Balto., MD 21202.

Introduction

Certificate of Need (CON) refers to a program wherein a license to open a newly-created hospital or related institution or a license to continue those which have relocated, modified or changed its services is issued.¹ The CON and license may only be granted if the hospital or related institution conforms to or is not inconsistent with the comprehensive health plan for the region. The Maryland State Health Planning and Development Agency (SHPDA) makes the final decision regarding conformance to the health plan and issues the license after considering recommendations of the appropriate Health Systems Agency (HSA).

Organizations subject to CON regulation are hospitals, related institutions (nursing homes, residential treatment centers, home health agencies, etc.), kidney disease treatment centers (including freestanding hemodialysis units), ambulatory surgical facilities, health maintenance organizations and other health services or programs specified as requiring a CON under State or Federal law.

The primary purpose of the CON program is to regulate major capital expenditures and changes in health care facilities with the intent of controlling costs. At the same time, issues such as availability, accessibility and continuity of health services are addressed.

Currently, physicians practicing in a private office setting in Maryland are not covered by Federal or State CON regulations. The necessity for physicians to be aware of and understand the CON process

remains of vital importance, as there is constant pressure both at State and Federal levels to include the private practice of medicine in the CON program. This knowledge is necessary for appropriate reaction to these attempts, as one cannot adequately deal with that which is not understood. The more complete the perception, the more accurate and intelligent the response.

Many, if not most, physicians practice in a hospital or health institution included in the CON process and thus are directly affected. The CON program is related to any improvement, updating or modification of services, from X-rays to surgical suites, air conditioning to number of beds. Any modification of services or capital expenditure must be approved and licensed by the State agency. The physician cannot be passive or uninformed about such vital issues affecting the quality and scope of care available to patients. The physicians must be part of the decision-making process and to be so, must be informed and knowledgeable.

CON legislation was first enacted in Maryland in 1968² and amended in 1978³ to incorporate the new Federal regulations resulting from the passage of Public Law 93-641.⁴

At that time, the CON process became a requirement for each SHPDA to administer. Each state was required to enact CON legislation and regulations by 1980 or risk the loss of Federal funds for health care programs. Revised regulations governing the State CON program were issued on March 24, 1978.⁵

Criteria within the minimum requirements as stated in the Federal legislation were established by which an applicant is reviewed. The more salient of these criteria are: 1) The relationship of the project to the health systems plan adopted for the region; 2) The need for the proposed services or facilities by the population served

or to be served; 3) The availability of less costly or more effective alternative methods of providing such services and 4) The immediate and long-term financial feasibility of the proposal and the impact of the proposal on the costs of, and the charges for, the provision of services by the applicant and other institutional health services providers in the area. In addition to the 12 review criteria, there are criteria concerning proposed new institutional health services for inpatients, and also special criteria with respect to Health Maintenance Organizations.⁶

The Certificate of Need Process

The process an applicant must follow to obtain a CON varies from state to state and can also vary within the HSAs of a single state. For example, Maryland has five HSAs with different CON processes. The authors have chosen to present the process used by the Central Maryland Health Systems Agency (CMHSA).

The CMHSA includes Anne Arundel, Baltimore, Carroll, Harford and Howard Counties and Baltimore City. It is a region of high-density population containing approximately 2,200,000 people, roughly one-half of the state's total population. The Central Maryland health service area contains more than 50% of the state's health care resources.

The CMHSA is a private, non-profit corporation with a board of community volunteers called the Governing Body. This has 101 members, 55% of whom are consumers (senior citizens, homemakers, business people, etc.) and 45% providers (physicians, dentists, nurses, hospital administrators, etc.). Local elected officials are also members. A 25-member Executive Committee is elected by the Governing Body. The CMHSA also has, as part of its structure, six local health planning councils known as Subarea Advisory Coun-

cils (SACs), one for each of the six jurisdictions. The SACs provide input and make recommendations on such issues as plan development and CON applications which relate to the particular jurisdiction. Impact on the CON program may be made at each of these levels.

The primary steps an applicant must take to process a CON application through the CMHSA and the SHPDA are as follows:

1. Submission of Letter of Intent: The applicant must submit contemporaneously to the Health Facilities Coordination Office (HFCO) of the Maryland Department of Health and Mental Hygiene and the CMHSA a letter of intent at least 60 days prior to the submission of a formal application. The letter of intent notifies the reviewing agencies that a capital project or change in service is being contemplated by a prospective applicant. The letter of intent should include such information as project purpose, brief description of the program, estimated costs, timetable, etc. When the CMHSA receives a copy of this letter, contact is normally made with the applicant to begin discussions and provide technical assistance if necessary.

2. Registration of Formal Application: Once the 60-day letter of intent period has expired, the applicant may then submit a formal application to the HFCO. The HFCO logs in the application and forwards it to the CMHSA for a pre-registration review. The CMHSA has 15 days to review the application for completeness and then recommends to HFCO whether the application should be registered. Assuming a positive review, the HFCO assigns a registration number to the application and the formal review process begins. From the date of registration, the CMHSA has 90 days to review the project and forward a recommendation to the SHPDA.

3. Process: Once registered, an application is reviewed and analyzed by the CMHSA Certification and Review staff, which then prepare a report and make recommendations regarding the proposed project. This preliminary staff re-

port, along with the application, is distributed for review and comment to the SAC affected by the applicant's proposal. For example, a proposed project by a hospital in Baltimore County would go to the Baltimore County SAC for review and comment.

The final staff report, with SAC review and comment and the application, is then forwarded to the Certification and Review Committee of the CMHSA, which conducts further studies and hearings and makes recommendations for the CMHSA Executive Committee's consideration. The Executive Committee reviews the application and associated data, may conduct appropriate interviews and then makes a final recommendation which is forwarded to the SHPDA.

During the 90-day review period, the applicant has an ongoing relationship with the CMHSA staff as well as attending and interacting with the various committees; i.e., Subarea Advisory Council, Certification and Review Committee and Executive Committee. This continued interaction between the applicant and the CMHSA staff cannot be underestimated. Staff must have a clear understanding of the applicant's proposal as well as the underlying assumptions being used if a knowledgeable and proper staff report is to result. A cooperative rather than an adversarial environment should be developed. It is usually beneficial for the applicant to discuss the proposal with staff as early in the process as possible—preferably at the time a letter of intent is being developed. This practice will normally lead to early resolution of potential problems occurring during the course of the review process. It should be noted that CMHSA staff should not be expected to provide, during these preliminary meetings, an absolute judgment as to whether it will recommend approval or disapproval for the project. The value of the meetings is to identify potential problem areas, provide assistance or direction where necessary and to begin meaningful dialogue so that future misunderstandings can be avoided. As noted, final CMHSA action is taken by the Executive

Committee. This action is based on the recommendations developed by the CMHSA staff report, the SAC and the Certification and Review Committee, along with the information provided in the application and any additional verbal or written statements made by the applicant or other interested parties.

4. Recommendations of the CMHSA: CMHSA actions with respect to applications for Maryland CON are limited to one of the four following recommendations: 1) approval, 2) disapproval, 3) approval with specific conditions and 4) action deferred for a specific time not to exceed 90 days, with explanation. The recommendation is then forwarded to the SHPDA for final action. The SHPDA will then normally act on the CMHSA recommendation within a 30-45-day time period. In case of deferral of action by the State agency, the maximum limit placed on the total review process is 210 days from the date of registration.

How Physicians Can Impact the Process

The CON program is quite technical—relationship to the health plan, statistics of various forms and assessments of needs must be considered. The process is, however, also political in nature.

Besides gathering technical data and supporting evidence, community support is also vital for a successful application. Elected officials, concerned community groups and related institutions, medical groups and health facilities must all be approached and informed. Their support must be actively sought and evidenced to the SAC, CRC and Executive Committee and, if necessary, to the State Agency.

The CON program should also be approached on a more basic level. The approval of an application is based to a great extent on the health plan of the region. To properly impact this, physicians must be involved with the entire health planning process. This means membership and participation in the HSA and SAC. Reading, analysis and reacting to the Annual Health Plan of the local HSA and that of the State Agency by

physicians and the Medical Societies is mandatory.

The point to be made is that physician involvement cannot begin and stop with the CON program. If impact is to be felt, physicians must participate in the entire health planning process.

Medical Miscellany

Are You an Artist?

Are you an artist as well as a physician, and, if so, did you know there is an annual art exhibit, of national calibre, strictly for doctor who are artists?

It's the American Physician's Art Association, an organization now in its 42nd year. This year it will meet with the Southern Medical Association and present its annual exhibit. The APAA has nearly 500 members across the country.

In 1979, the SMA meets in Las Vegas, NV from Nov. 4-7th.

All physicians who work in the fields of painting, sculpture, photography, graphic arts, design and creative crafts are encouraged to join the APAA to submit entries for the November exhibit.

The Annual Exhibit is always of top-rank quality, with professional arranging and hanging of the art works. Qualified judges each year award prizes in the following categories:

Oil and acrylics (classical and modern), water color, sculpture arts and crafts, photography and graphics. Each category has a First, Second and Third Prize. In addition, special Masters Awards, Honorable Mention and Best of Show are given. There is consideration for advanced and beginning artists, too.

Membership is open to all physicians. Southern Medical Association membership is not required. Those interested should write to: Milton S. Good, MD, Treasurer, APAA, 610 Highlawn Ave., Elizabethtown, PA 17022. ☐

Generics save money. Big money!

The FTC estimates that \$400 million could be saved annually on the nation's Rx bill if physicians prescribed generics. Are you saving *your* patients extra dollars?

Purepac, America's leading manufacturer of a national brand of generics, would like to show you the tremendous savings possible with just three of our 700 generic products:

DRUG		AVERAGE RX PRICE (100's)	\$ SAVINGS WITH PUREPAC	% SAVINGS WITH PUREPAC
Pavabid Capsules*	150 mg.	\$10.32		
Purepac Papaverine	150 mg.	3.95	\$6.37	61.7%
Equanil Tablets*	400 mg.	8.15		
Purepac Meprobamate	400 mg.	1.85	6.30	77.3%
Librium Capsules*	10 mg.	8.76		
Purepac Chlordiazepoxide HCl.	10 mg.	3.90	4.86	55.4%

*Registered trademarks of Marion Labs., Wyeth Labs., Roche Labs., respectively.

Purepac generics save money. Big money. Purepac is dedicated to providing your patients with quality products that are equivalent to their brand name counterparts at significant savings.

But we can't do it alone. We need your cooperation.

Send for Purepac's *free* Brand Name/Generic Name Reference Chart today. You'll receive an alphabetical listing of brand name drugs with their generic counterparts.

And next time you write a prescription, write for Purepac brand generics. Your patients will know you care.

PUREPAC. Competitive prices and peace of mind.

In Edema* or Hypertension* when potassium balance is a concern...

Potassium-Sparing

DYAZIDE®

Each capsule contains 50 mg. of Dyrenium® (brand of triamterene) and 25 mg. of hydrochlorothiazide.

Makes Sense

In Edema

The triamterene in 'Dyazide' limits potassium loss and provides an additive diuretic effect to that of the hydrochlorothiazide component.

In Hypertension

As the hydrochlorothiazide in 'Dyazide' lowers blood pressure, the triamterene component limits potassium loss.

Serum K⁺ and BUN should be checked periodically

particularly in the elderly, diabetics, and those with suspected or confirmed renal insufficiency (see Warnings). If hyperkalemia develops, substitute a thiazide alone.

Before prescribing, see complete prescribing information in SK&F Co. literature or PDR. A brief summary follows:

* WARNING

This drug is not indicated for initial therapy of edema or hypertension. Edema or hypertension requires therapy titrated to the individual. If this combination represents the dosage so determined, its use may be more convenient in patient management. Treatment of hypertension and edema is not static, but must be reevaluated as conditions in each patient warrant.

Contraindications: Further use in anuria, progressive renal or hepatic dysfunction, hyperkalemia. Pre-existing elevated serum potassium. Hypersensitivity to either component or other sulfonamide-derived drugs.

Warnings: Do not use potassium supplements, dietary or otherwise, unless hypokalemia develops or dietary intake of potassium is markedly impaired. If supplementary potassium is needed, potassium tablets should not be used. Hyperkalemia can occur, and has been associated with cardiac irregularities. It is more likely in the severely ill, with urine volume less than one liter/day, the elderly and diabetics with suspected or confirmed renal insufficiency. Periodically, serum K⁺ levels should be determined. If hyperkalemia develops, substitute a thiazide alone, restrict K⁺ intake. **Associated widened QRS complex or arrhythmia requires prompt additional therapy.** Thiazides cross the placental barrier and appear in cord blood. Use in pregnancy requires weighing anticipated benefits against possible hazards, including fetal or neonatal jaundice, thrombocytopenia, other adverse reactions seen in adults. Thiazides appear and triamterene may appear in breast milk. If their use is essential, the patient should stop nursing. Adequate information on use in children is not available.

Precautions: Do periodic serum electrolyte determinations (particularly important in patients vomiting excessively or receiving parenteral fluids). Periodic BUN and serum creatinine determinations should be made, especially in the elderly, diabetics or those with suspected or confirmed renal insufficiency. Watch for signs of impending coma in severe liver disease. If spironolactone is used concomitantly, determine serum K⁺ frequently; both can cause K⁺ retention and elevated serum K⁺. Two deaths have been reported with such concomitant therapy (in one, recommended dosage was exceeded, in the other serum electrolytes were not properly monitored). Observe regularly for possible blood dyscrasias, liver damage, other idiosyncratic reactions. Blood dyscrasias have been reported in patients receiving triamterene, and leukopenia, thrombocytopenia, agranulocytosis, and aplastic anemia have been reported with thiazides. Triamterene is a weak folic acid antagonist. Do periodic blood studies in cirrhotics with splenomegaly. Anti-hypertensive effect may be enhanced in post-sympathectomy patients. Use cautiously in surgical patients. The following may occur: transient elevated BUN or creatinine or both, hyperglycemia and glycosuria (diabetic insulin requirements may be altered), hyperuricemia and gout, digitalis intoxication (in hypokalemia), decreasing alkali reserve with possible metabolic acidosis. 'Dyazide' interferes with fluorescent measurement of quinidine.

Adverse Reactions: Muscle cramps, weakness, dizziness, headache, dry mouth; anaphylaxis, rash, urticaria, photosensitivity, purpura, other dermatological conditions; nausea and vomiting, diarrhea, constipation, other gastrointestinal disturbances. Necrotizing vasculitis, paresthesias, icterus, pancreatitis, xanthopsia and, rarely, allergic pneumonitis have occurred with thiazides alone.

Supplied: Bottles of 100 and 1000 capsules; Single Unit Packages of 100 (intended for institutional use only).

SK&F CO.
a SmithKline company

SK&F CO.
Carolina, P.R. 00630

**When painful spasm
is the presenting
symptom...**

...in the functional bowel/irritable bowel syndrome*

Bentyl®

(dicyclomine hydrochloride USP)

10 mg. capsules, 20 mg. tablets,
10 mg./5 ml. syrup, 10 mg./ml. injection

helps control abnormal motor activity
with minimal anticholinergic side effects†

Demonstrated smooth muscle relaxant activity.

In this double-blind study, twenty patients having G.I. series and exhibiting spasm were randomly selected to receive either 2 cc. of Bentyl or sodium chloride intramuscularly. Ten minutes after the injection another radiograph was taken . . .

. . . Bentyl produced definite relaxation in 8 of 10 patients. The sodium chloride produced relaxation in only 3 of 10. No side effects occurred in either group of patients.

Pylorospasm has almost totally blocked passage of barium meal.

Barium meal beginning to pass 10 minutes after intramuscular injection of 20 mg. Bentyl.

“The correlation of spasm relief and drug given was excellent.”

*This drug has been classified “probably” effective in treating functional bowel/irritable bowel syndrome.

†See Warnings, Precautions and Adverse Reactions.

See following page for prescribing information.

Reference:

King, J.C. and Starkman, N.M.: Evaluation of an antispasmodic. Double-blind evaluation to control gastrointestinal spasms occurring during radiographic examination. A preliminary report. Western Med. 5:356-358, 1964.

Merrell

Bentyl® (dicyclomine hydrochloride USP)

Capsules, Tablets, Syrup, Injection

AVAILABLE ONLY ON PRESCRIPTION

Brief Summary

INDICATIONS

Based on a review of this drug by the National Academy of Sciences—National Research Council and/or other information, FDA has classified the following indications as "probably" effective:

For the treatment of functional bowel/irritable bowel syndrome (irritable colon, spastic colon, mucous colitis) and acute enterocolitis.

THESE FUNCTIONAL DISORDERS ARE OFTEN RELIEVED BY VARYING COMBINATIONS OF SEDATIVE, REASSURANCE, PHYSICIAN INTEREST, AMELIORATION OF ENVIRONMENTAL FACTORS.

For use in the treatment of infant colic (syndrome).

Final classification of the less-than-effective indications requires further investigation.

CONTRAINDICATIONS: Obstructive uropathy (for example, bladder neck obstruction due to prostatic hypertrophy); obstructive disease of the gastrointestinal tract (as in achalasia, pyloroduodenal stenosis); paralytic ileus, intestinal atony of the elderly or debilitated patient, unstable cardiovascular status in acute hemorrhage; severe ulcerative colitis; toxic megacolon complicating ulcerative colitis; myasthenia gravis. **WARNINGS:** In the presence of a high environmental temperature, heat prostration can occur with drug use (fever and heat stroke due to decreased sweating). Diarrhea may be an early symptom of incomplete intestinal obstruction, especially in patients with ileostomy or colostomy. In this instance treatment with this drug would be inappropriate and possibly harmful. Bentyl may produce drowsiness or blurred vision. In this event, the patient should be warned not to engage in activities requiring mental alertness such as operating a motor vehicle or other machinery or perform hazardous work while taking this drug. **PRECAUTIONS:** Although studies have failed to demonstrate adverse effects of dicyclomine hydrochloride in glaucoma or in patients with prostatic hypertrophy, it should be prescribed with caution in patients known to have or suspected of having glaucoma or prostatic hypertrophy. Use with caution in patients with: Autonomic neuropathy. Hepatic or renal disease. Ulcerative colitis. Large doses may suppress intestinal motility to the point of producing a paralytic ileus and the use of this drug may precipitate or aggravate the serious complication of toxic megacolon. Hyperthyroidism, coronary heart disease, congestive heart failure, cardiac arrhythmias, and hypertension. Hiatal hernia associated with reflux esophagitis since anticholinergic drugs may aggravate this condition.

Do not rely on the use of the drug in the presence of complication of biliary tract disease. Investigate any tachycardia before giving anticholinergic (atropine-like) drugs since they may increase the heart rate. With overdosage, a curare-like action may occur.

ADVERSE REACTIONS: Anticholinergics/antispasmodics produce certain effects which may be physiologic or toxic depending upon the individual patient's response. The physician must delineate these. Adverse reactions may include xerostomia; urinary hesitancy and retention; blurred vision and tachycardia; palpitations; mydriasis; cyclopia; increased ocular tension; loss of taste; headache; nervousness; drowsiness; weakness; dizziness; insomnia; nausea; vomiting; impotence; suppression of lactation; constipation; bloated feeling; severe allergic reaction or drug idiosyncrasies including anaphylaxis; urticaria and other dermal manifestations; some degree of mental confusion and/or excitement, especially in elderly persons; and decreased sweating. With the injectable form there may be a temporary sensation of lightheadedness and occasionally local irritation. **DOSEAGE AND ADMINISTRATION:** Dosage must be adjusted to individual patient's needs.

Usual Dosage: Bentyl 10 mg. capsule and syrup: *Adults:* 1 or 2 capsules or teaspoonfuls syrup three or four times daily. *Children:* 1 capsule or teaspoonful syrup three or four times daily. *Infants:* ½ teaspoonful syrup three or four times daily. (May be diluted with equal volume of water.) Bentyl 20 mg.: *Adults:* 1 tablet three or four times daily. Bentyl Injection: *Adults:* 2 ml. (20 mg.) every four to six hours intramuscularly only. **NOT FOR INTRAVENOUS USE. MANAGEMENT OF OVERDOSE:** The signs and symptoms of overdose are headache, nausea, vomiting, blurred vision, dilated pupils, hot, dry skin, dizziness, dryness of the mouth, difficulty in swallowing, CNS stimulation. Treatment should consist of gastric lavage, emetics, and activated charcoal. Barbiturates may be used either orally or intramuscularly for sedation but they should not be used if Bentyl with Phenobarbital has been ingested. If indicated, parenteral cholinergic agents such as Urecholine® (bethanechol chloride USP) should be used.

Product Information as of October, 1978.

Injectable dosage forms manufactured by CONNAUGHT LABORATORIES, INC., Swiftwater, Pennsylvania 18370 or TAYLOR PHARMACAL COMPANY, Decatur, Illinois 62525 for MERRELL-NATIONAL LABORATORIES, Division of Richardson-Merrell Inc., Cincinnati, Ohio 45215, U.S.A.

The Physician as a Debtor

By JOHN C. KRANTZ, JR., PhD

For reprint and other data, write Dr. Krantz at Gibson Island, MD 21056.

The Apostle Paul, in his letter to the church at Rome, declared "I am a debtor both to the Greeks and to the Barbarians; both to the wise and the unwise . . ." He was determined to make available to the entire world the beauty and satisfaction of the Christian faith. In a similar manner, the physician is debtor to a host of men from many walks of life who have provided him with the tools of healing. From this chosen group he has inherited the skills which provide him with the emotional satisfaction of serving one's fellow man. In this sense, like St. Paul, the physician is a debtor.

Oliver Wendell Holmes took delight in parading before his medical colleagues the debt what medicine owes to the lay empiricists. He wrote "Medicine learned from a monk how to use antimony, from a Jesuit how to cure agues, from a friar how to cut a stone, from a soldier how to treat gout, from a sailor how to keep off scurvy, from a postmaster how to sound the eustachian tube, from a dairy maid how to prevent smallpox and from an old market woman how to catch the itch insect."

One is constrained to continue the ever-increasing list of those in other walks of life who have made definitive contributions to medicine. When the Spanish invaded Peru in 1531, Francisco Pizarro learned from the Incas that Cinchona bark infusions would cure malaria. He took the bark to Europe, where it enjoyed widespread use in the treatment of malaria. In 1820, the two pharmacists Pelletier and Caventou isolated the alkaloid quinine from the bark. Just prior to that date, the youthful apothecary Frederick Wilhelm Adam Surtturner isolated morphine from opium. The chemist to the French wine industry, Louis Pasteur, laid the foundation stones for medical bacteriology. In the early years of the 20th Century, Madame Curie,

the distinguished physicist, worked with tons of pitch blind to obtain milligram quantities of radium. I was Stephen Hales, an English clergyman, who measured the blood pressure of a horse in 1733 by inserting a nine-foot tube into an artery and observed the powerful pressure of the blood. It was a dentist, William T. G. Morton, who introduced anesthesia into medicine in 1846. The soil chemist, Selman Waksman, isolated Streptomycin from soil in 1941, and it was found to be useful in the treatment of tuberculosis. Added to this list should be another clergyman, the Reverend Edward Stone of England, who in 1763 observed the medicinal value of willow bark. The bark yielded salicin, and aspirin followed at the turn of the century. This medicine is consumed in quantities of 20-30 tons daily in safety by the American public mainly for the relief of pain. There is likely no other substance that has provided relief for as many people as has aspirin.

When the physician walks into the sick room of his patient, looking down on him from the great Valhalla of Medicine are the great medical giants: Koch, Osler, and others—he is their representative—but he is also a debtor to that great galaxy of laymen of the past who have made many valuable contributions to the profession. □

as a professional man,
can you afford to
pass up car leasing?

When you lease your car, lease it from us—the car specialists. The demands on a professional man's time are overwhelming. Our custom-tailored leasing plan can relieve you of the time-consuming details of maintaining personal transportation. By leasing a Ford at low cost you free your dollars for other purposes—simplify your tax accounting—assure predictable vehicle costs. See us for a professional look at leasing, no obligation. *Cars are our business.*

STAMMER'S SPORT AND MARINE CENTER

**"THE BEST PRICES AND
SERVICE IN MARYLAND"**

Bayliner 3150

Conquest Sunbridge -- Just introduced for the 1979 model year, Bayliner's Conquest Sunbridge is a high performance offshore sport boat uniquely well-equipped for cruising. Two separate staterooms, including a mid-ship compartment, give total privacy to two couples. For entertaining there's a luxurious salon and full galley. Power options include both gas and diesel powerplants.

Buccaneer 295

This half-ton performance cruiser is a thoroughbred; descended directly from a recent world champion. And even with increased interior room and the convenience of full galley, private head, stateroom and more, the performance potential has been kept, with such refinements as laminar flow keel, tapered spars and much more. Diesel power is standard.

***Part 3: A Physician's Political Life: An Exclusive Interview with Dr. Pierpont—**

by Blaine Taylor . . . p. 73

EDITORIAL: Dr. Pierpont's Case and "Educational Malpractice"

Whether one agrees with Dr. Pierpont's politics or not is not important. His story is. Dr. Pierpont alleges that over 100 Maryland physicians were introduced to the Baltimore Grand Jury probe in one way or another during a two-year period. The fact that the number selected out for indictment was only 10 is not comforting. Nor is the fact that only **one** actually went to trial. Fortunately, that one, Dr. Pierpont, had the courage to tell his side of the story in order that others will not fall prey to similar legal hassles, onerous financial plight and unending mental anguish.

If only one other Maryland physician is spared the anguish that Dr. Pierpont has experienced as a result of reading his story, then this Editor will be satisfied that the publication of his manuscript was worth the effort. I believe that Dr. Pierpont feels the same.

Unfortunately, we all too often repeat our errors and fail to learn from history. Dr. Pierpont's case will be forgotten and this issue of the **Journal** will be found from time to time in the archives of a few libraries. The medical schools of Maryland can, however, better prepare future physicians for the practice of medicine in this state as well as elsewhere. We do not practice our specialties in a legal vacuum. Regardless of medical or surgical interest, we daily face scores of State and Federal laws that regulate our practice. To be ignorant of the law is no excuse. To have received little or no introduction to the laws affecting the practice of medicine, in medical school, is evidence of "educational malpractice."

Note: The opinions and assertions expressed throughout this three-part section are entirely those of Dr. Pierpont. Publication does not imply endorsement by the **Journal**, the Medical and Chirurgical Faculty of Maryland or any other organization with which Dr. Pierpont is associated. ☐

Part 1: The Spoiler:

A Biographical Sketch of Ross Zimmermann Pierpont, MD

By BLAINE TAYLOR

Contact Mr. Taylor, *Journal* Managing Editor, for reprint and other information c/o the *Journal*, 1211 Cathedral St., Balto., MD 21201.

Introduction

Dr. Ross Z. Pierpont stood before an assemblage of reporters and banks of television cameras in Annapolis on July 1, 1974, after he formally filed as a candidate in the Republican Primary Election for the United States Senate seat held then (as now) by Charles McC. "Mac" Mathias, Jr.

Dr. Pierpont stated: "I am innocent of any wrongdoing, and I am the victim of a witchhunt and an attempted political assassination."

Hanging ominously over Dr. Pierpont's head were charges of illegal drug prescriptions that carried with them a fine of \$100,000 and two years' confinement in prison. Eventually, Dr. Pierpont would have his day in court and be adjudged not guilty of all charges, but not before long months of mental anguish to himself and his family and a personal cost of \$50,000 in legal fees.

The following three articles—one by him—attempt to tell his story, if that can adequately be done.

A Churchillian Figure

Dr. Pierpont, 61, has been Chief of Surgery at Baltimore's Maryland General Hospital since 1960. A non-smoker, he arises at 4 AM and

DR. PIERPONT
(Photo by Udel, Baltimore.)

generally lives up to his reputation as characterized once in the Baltimore Sun: "Flamboyant and energetic."

A tough-talking, rough-hewn,

"rugged individualist" of the old school of American pop heroes ala John Wayne, the blunt, balding, bespectacled doctor resembles somewhat the bulldog-like late former British Prime Minister Sir Winston Churchill, whose statue and glass muglike-images grace the den of his Homeland residence in suburban northeast Baltimore, along with flags of the US and Maryland and shelves of books on history and politics.

Politics. That's the word—not medicine—that comes to mind when one conjures up the fighting image of Ross Pierpont. In a whirlwind career spanning the last 12 years of Free State history (see Table 1), he's run (always unsuccessfully) for every office from the US Senate (twice) to Governor of Maryland (twice) to Mayor of Baltimore (once) to Congress (once).

Always an independent-minded person, he switched political parties in 1970 and kept right on running. Will he ever stop? Even he doesn't know, as the following exclusive *Journal* interview bears witness.

Some view him as a racist reactionary and, perhaps, a fool, but he is neither, as his political track record and medical career—when examined closely—will show.

Concerning the first, 1964 was the year that saw the advent of segregationist George Wallace as a Presidential candidate in Maryland, but two years later, Ross Pierpont became the first white man in the state's history to choose a black running mate. He did so twice again, in 1971 and 1978 (on the latter occasion, he asked Annapolis physician and Med-Chi member Aris T. Allen to run with him; Allen ran with J. Glenn Beall instead.)

Educationally, he received his

Table 1: The Pierpont Candidacies, 1966-78

Year	Office Sought	Party Affiliation	Main Candidate Opposed
1966	Governor	Democrat	Carlton Sickles
1968	US Senator	Democrat	Sen. Daniel B. Brewster
1970	US Senator	Democrat (but never filed)	Sen. Joseph D. Tydings
1970	US Congressman	GOP	*Rep. Clarence D. Long
1971	Mayor of Baltimore	GOP	Baltimore City Council President William Donald Schaefer
1974	US Senator	GOP	Sen. Charles McC. Mathias, Jr.
1978	Governor	GOP	J. Glenn Beall, Jr.
1979	?	?	?
1980	?	?	?

(*NOTE: Dr. Pierpont became a Republican in 1970; he has lost all of the above seven electoral contests.—BT.)

MD from the University of Maryland School of Medicine and his BS from the U of M's School of Pharmacy. A surgeon in private practice with offices in Towson and Havre de Grace, he is on the staff of five major metropolitan Baltimore-area hospitals and is a member, fellow or diplomate of numerous professional societies as well, including Med-Chi.

A golfer, squash and racquetball

player, Dr. Pierpont is also an investor in real estate, oil and gas wells and serves on several public advisory boards and committees, too.

Born at Woodlawn, MD on Sept. 7, 1917, he started out "broke," he says, but is now reputed to be a millionaire. In 1974, his daughter Christine Celeste (now 27) married Baron Lippold von Klencke of Hanover, sole heir to

Haemelschenburg Castle in Germany.

The Pierponts (he married the former Grace Schmidt in 1942) have a private staff of two who have been with their family for more than 25 years: housekeeper Elaine Cole and chauffeur Charles Shipley.

The story of what happened to Dr. Pierpont in 1974—told in his own words—follows. □

Part 2: The Buscemi Case and Its Ramifications

(Selected Excerpts From the Unpublished Book Manuscript of *All the Supreme Court's Men*)

By ROSS Z. PIERPONT, MD

(Edited by Blaine Taylor)

For reprint and other data, contact Dr. Pierpont at 5602 Enderly Rd., Balto., MD 21212.

Enter Buscemi

It turned into a long day and night as I retraced my way through the nightmare . . .

While in my office in Havre de Grace on March 22, 1974 in the morning and during the course of patient flow, my nurse brought a man into my consulting room. The man was a stranger to me. The nurse gave me the patient's record card showing a complaint of severe pain in both legs. She left the room.

The patient, now known to me as Salvatore Buscemi, began to talk in great excitement that quickly approached hysteria. Hand and body gestures indicated some loss of self-control. It became clear that I was dealing with either a potentially-violent (mentally-disturbed) patient or a drug addict badly in need of "a fix."

As I was examining the patient's eyes, arms and legs, he confessed he was an addict. He said he had come to my office in desperation. He reached into his pocket and pulled out a railroad ticket to Kentucky. He said he was on his way to the drug treatment center in Kentucky, but he couldn't make it there without drugs to see him through. He said he was going to do something desperate if he didn't get help at once.

As the patient spoke, his agitation increased. He stated he had been a numbers runner on "the Block" (a location of bars and striptease clubs in downtown Baltimore—ed. note) and had met me during my prior political campaigns. He stated he was in with the Block gang, and added threats more or less in these words: "You're a good guy, Doc. Please don't make me do anything wrong. I'm desperate. Don't make me do what I don't want to do," he kept repeating. During such talk, the man put his hand into his pocket and pointed something

at me. Whether he carried a weapon or not, I do not know. He never pulled a gun on me, but the pointing was sufficient.

I told the patient I did not treat addicts and would not do so now. I would, however, refer him to a treatment center, specifically Man Alive at Johns Hopkins Hospital in Baltimore.

As I told Buscemi I would not treat him for addiction, he became so agitated I began to think of ways to protect myself. Normally, addicts are not prone to physical assault, but in his state and possibly thinking of drugs normally found in a clinic such as the one in Havre de Grace, an addict denied drugs could go to almost any lengths to get them.

I tried to calm Buscemi, but he refused to quiet down. Again he showed me his railroad ticket. He pleaded with great sincerity for me to help him get to Kentucky where he was going to turn himself in.

I decided not to run the risk of violence either to myself, another innocent person or my family. He asked for 200 tablets of Dilaudid. I reasoned with him that his request was out of line with the need, and finally wrote him a prescription for 80 tablets of Dilaudid. I entered the prescription on the patient's record, and he paid my usual fee of \$15 (in cash). I gave the \$15 and the record card to my nurse. After Buscemi had left, I considered calling the Harford County Police, but decided against it and went about my work.

Buscemi returned to my waiting room Monday morning, March 25th, where he appeared disturbed—unable to sit or even stand as a normal patient does. I have never refused to see anyone with or without an appointment (a rule known to my nurse) and she finally brought Buscemi into my consulting room.

Buscemi cried. He said he had been in an auto accident in which he had lost all his clothes, the prescription with them. He babbled about violence which he had

either done to others himself or seen done to others; I am not sure which.

Anger got the better of me and I pushed Buscemi out of the office physically. Shaken, but regaining my control, I went back to my office, and Buscemi almost immediately pushed his way in again, this time to say I was killing him if I sent him away with no help. He would never make it back to Baltimore alive, he said. His condition seemed to be deteriorating so badly that while I refused him any Dilaudid, which he begged for, I prescribed a mild sedation, Demerol (24 tablets, 50 mg. each).

Buscemi went away only to come back once again, perhaps an hour later, to see me. I thought of calling the Harford County Police, but decided the risk was not worth it; I have handled hysterical and somewhat violent cases before. By now I was also convinced he was a most unusual addict, quite possibly with the connections on the Block he had bragged about. Buscemi had his hand in his pocket, and at this point he pulled out a piece of paper I recognized as a badly mutilated prescription blank of the Clinic. The blank proved, he said, that he had been in an accident and had never "cashed" his prescription from me. Further, he was an undercover agent, though an addict, of the Baltimore City Police Department. While talking, he pulled out a ticket to somewhere in Texas, I cannot recall where, but it was supposedly to another Federal drug treatment center replacing Lexington, KY, which had been closed. Buscemi said I could easily find out that he was telling the truth by calling the Baltimore Police and asking for Lt. Leon Tomlin of the Narcotics Squad. He gave me Tomlin's number. I admit I felt relief, and the strangeness of a Baltimore City Police agent, and addict, traveling to seek me out on two separate occasions in Havre de Grace, passed me by.

I immediately called the number Bus-

Buscemi gave me and spoke with Lt. Tomlin. I asked him about Buscemi and was assured by Tomlin that Buscemi was in fact helpful in their work. While I was on the phone with Lt. Tomlin, Buscemi broke in to tell me I should ask Lt. Tomlin about his getting drugs at Richmond's Drug Store (in Baltimore as it turned out). Buscemi said Richmond's Drug Store knew him as an addict working with the Police and entitled to drugs. I relayed this question to Lt. Tomlin, whose answer was something like "Uh-huh." Looking back in the light of later developments, I can see that Tomlin had not really given me a full verification of Buscemi's status. However, the addict was standing by my telephone and talking to me as I spoke with the Police Lieutenant, and if Lt. Tomlin did not approve of Buscemi's actions, he had only to say the word. The opposite was true. I was led, by the circumstances and the conversation, to believe I was dealing with a legitimate Police Department operation using an addict as an undercover agent.

I telephoned Richmond's Pharmacy. The pharmacist confirmed knowing Buscemi as an addict, as Buscemi said. If I wrote him a prescription, they said, and identified Buscemi as an addict on it, they would fill it on a one-time basis. I thereupon wrote Buscemi a prescription which was to replace his Friday prescription; However, I reduced the quantity to 40 tablets and identified Buscemi as an addict on the blank, as the pharmacist directed. The prescription was entered on the patient card and returned to my nurse. The usual charge of \$10 for a second visit was also entered. This charge was later billed by mail, including a "Past Due" notice, but it has never been paid.

On Tuesday, March 26th, Buscemi came into my waiting room in Baltimore and waited to see me. Something now began to arouse my suspicions—the pursuit was too constant to be normal. I refused further assistance of any type. I ordered him out of the office. His Baltimore record contains this notation dated March 26, 1974, initialed by me: "This man is a drug addict. We will not give him any Rx."

During the next few days, Buscemi appeared in my Baltimore office on additional occasions, and each time we refused to have anything to do with him.

When I walked into my Baltimore office Friday afternoon, on March 29th, Buscemi was seated in the consultation room. He asked for a prescription for drugs. I refused in some anger and ordered him out. He told me he had brought Lt. Tomlin of the Baltimore Police with him to prove he was an addict working with the police as he had said all along. I looked to see what he was talking about, and saw a man in the hall. He showed me his Police ID card which identified him as Lt. Tomlin, the same man I had spoken with from Havre de Grace on Monday.

The presence of Tomlin brought me

to a full showdown. Whatever these men were up to, the Police were clearly part of it. I had had my fill of Buscemi, and at this point I had no more confidence in Tomlin than I had in the addict. I demanded of Tomlin in a loud voice heard throughout my office: "Are you trying to trap me? Is this a set-up?" Tomlin did not answer. In language beyond repeating I told both men to get out of my office and stay out. Buscemi continued to press for drugs, but Tomlin then said something like "Come on Sal. We might as well get out of here." They left. I had not realized a female patient was waiting for me in an adjacent examination room, and I apologized to her for the language she had been subjected to.

On Saturday, March 30, 1974 in the early afternoon, Buscemi rang the bell at my home in Baltimore. He said he had brought me a color television set. He would not go away. Cajoling, threatening, pleading and offering goods, money—anything I would ask for would be mine in return for a prescription. My wife was totally unprepared for the scene and was terrified—almost in shock. Finally, Buscemi left the box he had brought. It was in my home until Monday, Apr. 1, 1974, when Buscemi came with a man he said was his brother and took the box away. I never saw the contents of the box.

On Friday, May 31, 1974, Lt. Tomlin handed me a subpoena to appear before the Baltimore Grand Jury on the next Tuesday (June 4th). I immediately called the Baltimore State's Attorney's Office, in Tomlin's presence. As I put through the call, Lt. Tomlin became agitated and did not want to stay. While holding Tomlin by the arm, I spoke with a Mr. Bollinger of the Baltimore State's Attorney's Office. I told him this looked "Fishy as hell to me. It looks like a trap and a set-up." He made no comment that I recall. I offered to testify before the Grand Jury, but the requested date on June 4th was impossible on such short notice due to a complete operative schedule that day. He said he would postpone my appearance one week, to June 11th. Following this, Lt. Tomlin brought a summons to my home for June 11th. One day prior to the scheduled appearance, a Mr. Cremin of the Baltimore State's Attorney's Office called me in Havre de Grace to advise I would be required to sign a waiver of immunity. He advised obtaining legal counsel. To this point, I had never even mentally doubted my position—in fact, I had almost forgotten "the week of Salvatore Buscemi."

Now, however, a new type of threat was taking shape. That night, I spoke with my attorneys, Edward Johnston and Nevitt Steele, by telephone, and they advised me not to sign anything, including the waiver of immunity required before appearing before the Baltimore Grand Jury. I had attempted to get attorney George Russell, but he was in White Sulphur Springs, WV attending the 4th Circuit Judicial Conference. He returned June 30, 1974, when I retained him.

They advised me not to sign anything.

Since the rest of the story was known to Nevitt Steele and they were in communication, it did not seem necessary to relate the progress of the events of June . . .

The Parren Mitchell/ Milton Allen Link

George Russell and I were conferring daily. He was having increasing difficulty with Milton Allen and couldn't understand why. I thought I knew why.

(Ed. Note: Mr. Allen was then Baltimore State's Attorney. It was his office that was prosecuting Dr. Pierpont's case. Dr. Pierpont's strong suspicion was that Baltimore Congressman Parren J. Mitchell was behind Allen in a political attempt to smear Dr. Pierpont and thus remove him as a threat to Sen. Mathias' reelection bid in 1974.)

The Olesker "Betrayal" . . . and Indictment

I had just drifted off to sleep when the phone rang. It rang several times before I realized just what was happening.

Fumbling with the receiver I said, "Hello."

"Is this Ross Pierpont?"

"Yes."

"This is Mike Olesker, Baltimore News American. I'm calling you to verify a story we've picked up."

"What's that?" I asked.

"We have it on good authority that your name is among those who are going to be indicted on drug charges by the Baltimore City Grand Jury. Since I know you so well, I didn't want to print anything except the facts about such a problem."

I was cornered. Dead-tired, but thinking straight, I reasoned that this reporter obviously had all the facts. He was continuing about dilaudid and Buscemi and facts surrounding the case which no one could possibly have known except the Grand Jury, the State's Attorney's office, my lawyers and myself.

My first inclination was to respond with "no comment." However, there had been so many responses of "no comment" by persons later proven to be guilty that this almost seemed an admission of guilt. My thoughts went on.

This Michael Olesker had been quite fair in the 1971 Baltimore City Mayoral campaign when he had spent a whole day campaigning with me. His in-depth article which followed was more favorable than most of the liberal press and I had been grateful. I was especially impressed with his fairness because he was the prototype of the liberal, far-out news hound: always probing for the soft underbelly, to report possible prejudice or bigotry. Only his quarry was suspect. Only the candidate could be all bad. This, unfortunately, is not uncommon today, as the mass media is a constant, malignant adversary.

At any rate, Olesker had been kinder and fairer than most, and I rather liked

him. More to the point, we had had several confidences over the years and he had never breached them. Nonetheless, Olesker had a deep, abiding distrust of me, all the same, just because I was a conservative but, we had shared a mutual respect . . . or so I thought.

I said "Look. If you will treat this off the record and confidential, I will tell you what I know." This to me meant he would not print.

"Absolutely," he responded.

"We are faced with a runaway Grand Jury, an entrapment and an illegal indictment, all of which we expect to dissipate with no problem."

"How?"

"My attorney, George Russell, is working with the damned foolishness and it is in a ticklish phase. We know it's nonsense and you have known me long enough to evaluate this ridiculous charge."

"Yes. Anything else?"

"I guess that's about all there is to it."

"Will you still run?"

"Absolutely."

We hung up. I went off to sleep, content that I had finished an off-record conversation with a trusted newspaper reporter. I was confident he would not breach Grand Jury secrecy by publication.

On Friday, June 28th, in the early afternoon, I was greeted with a screaming four-inch newspaper headline: **PIERPONT INDICTED**. The radio reports and all media were full of the story. All details were spelled out in a full front page exposé in the *Baltimore News American* under the byline of Michael Olesker, my confidante.

I immediately went incommunicado as well as one can with a surgical practice to look after and sick patients to see. The few people I saw, friends, colleagues and adversaries were instantly aware of the facts and I was deluged with sympathy, disdain, avoidance and snide remarks, literally the gamut of all human emotions during that one and one-half hours. I finally looked away from my patients and the hospital and got to George Russell's office.

There was no withstanding the fact that we were face-to-face with a catastrophe of major proportions. What had been a possibility or probability was now a fact, brazenly staring out of translucent news boxes all across the state. If anyone missed it, he was delivered the material as the lead story on the first radio or television newscast he heard . . .

A Death Threat, Campaigning Under a Cloud and the Indictment Thrown Out

Grace and I were jolted awake by a loud knocking on the front door and the doorbell ringing.

Bolting up in bed, I rasped, "What in hell is that now?"

Grace spoke quickly. "Be careful."

I got up and looked out the window. I couldn't believe it. The streets were crawling with police. Blinker lights were flashing up and down the block in front of the house. Police were on the lawn. I looked out to the lawn which goes around and behind the house and it was full of other police cars with lights flashing and police were everywhere.

"For God's sake, what have I done now?" I exclaimed. "The neighbors will think I'm a hardened criminal. Just what in hell is all this?" All the while, the pounding continued on the front door. I picked up an old shotgun, not sure what I was going to do and went downstairs.

"Who is it?"

"Dr. Pierpont, this is the police. We need to talk to you."

"I don't give a damn who you say you are. I'm not letting anybody in the house. I don't trust the police and whoever you are, I don't trust you."

"Doctor, I don't blame you for what you're thinking, but we're here to protect you. My name is Capt. Becker and if you will call Central Police Headquarters, they will verify my story. There has been a threat on your life."

Grace groaned, "Good God."

I spoke up again. "You wait right there and I'll check."

A quick call verified the entire story. I went back to the front door and opened it to face a whole squad of police and plainclothes men led by Capt. Becker, who turned out to be a very good sort.

Three of the police came in with the Captain and we went back to the den. I made apologies for my attitude, but explained that after what I had been through, what with being set up by Lt. Tomlin and the addict Buscemi, Milton Allen and the rest, I trusted no one, especially Police.

Captain Becker said, "I don't blame you and I sympathize with your problem, but I hope you will feel differently about us. We are here to protect you. We've had a threat on your life. Have you received any strange calls in the last hour?"

"No."

He continued, "A call was taken at headquarters and recorded. The voice said 'This is Black October. We're gonna assassinate Dr. Ross Pierpont at 3:30 PM tomorrow at the Maryland General Hospital!' That is all that was said and they hung up. The only thing we have to go on is that the voice was male, almost certainly black and probably young. Do you know anything about this?"

"No. What do you know?"

"Only this. We got similar warnings before the murder of Delegate Turk Scott. We are taking this very seriously. Scott's dead, you know."

"I know. This Black October gang are supposedly black vigilantes, aren't they?"

"Yes," continued Capt. Becker. We are of the belief that this is a very small group of blacks, maybe only one or two,

who have adopted the Black October name, which signifies an avenger. They are supposedly out to destroy the drug pushers and dealers preying on the black community. It makes our work that much tougher when they are not organized. We don't know where to look. It's like a needle in a haystack. It could be anyone."

Grace was beside herself with fear. "What can we do?"

"Be careful. We'll cover you. I'm going to leave two men in the house tonight and we'll patrol the outside of the house . . ."

●

"What is your schedule?" Capt. Becker asked.

I outlined the planned campaign tour of the state and he whistled. "Well we've got the night cut out for us. We'll need the FBI and the State Police. You and Mrs. Pierpont go to bed. We'll cover you. Don't leave the house until my morning men arrive. We'll have two detectives and escorts to the Airport Hotel. After that, the State Police and the FBI will take over. I'm terribly sorry. Good-night." He left. The two police sat: one in the living room and one in the den. We went to bed.

In the morning, we were up early. Looking out, I could spot three cars parked, two in the front and one in the back of the house. Just as we were finishing breakfast, the doorbell rang and one of the policemen let two plainclothes men in. They introduced themselves and explained that they would walk in front and back of Grace and myself as a shield and that we should sit in the back of the car well down and to please not move quickly until they were in position around us. It was pretty eerie. We went out-single-file as directed. We looked like a safari. One detective sat in front, the other in back with Grace and me. As we left the house, one of the cars took up a position in front of the car and another to the rear. We arrived at the Friendship International Hotel without incident. The place was teeming with State Police.

The Police continued to surround me and the area of the press conference. All well-wishers were checked as were reporters, TV personnel, etc. The press conference over, we headed for the airplane covered like a tent with security. The plane in which we were riding was thoroughly searched and checked out for explosives or problems, and Grace and I were held in the car beside the plane while this was accomplished. We were then hustled aboard with Rich Hollander, a *News American* reporter who had requested permission to accompany us, and we took off—much to the relief of the Police.

Our first stop would be Gaithersburg. . . . The runway and small airport lounge were covered with State Police cars and other Police, but only two faithful campaigners and two reporters were there to meet us. We kept up a running fire of conversation and an outward bravado,

Table 2: A Pierpontian Chronology, 1974-78

1974

- March 22nd:** Dr. Pierpont first meets Salvatore Buscemi as patient, in Havre de Grace, Harford County, MD
- March 25th and 26th:** Buscemi returns
- March 29th:** Buscemi visits Baltimore office
- March 30th:** Visits Pierpont home in Baltimore
- April 1st:** Returns to Piermont home and retakes box (TV?)
- May 31st:** Lt. Leon Tomlin calls Dr. Pierpont; presents him with subpoena at Dr. Pierpont's Baltimore office to appear before the Baltimore Grand Jury on June 4th
- June 26th:** Dr. Pierpont indicted; charged with illegal prescription of drugs to Buscemi
- June 27th, 11:45 PM:** Dr. Pierpont meets with Helen Delich Bentley at her home to discuss US Senate race
- June 30th:** Dr. Pierpont retains George Russell as his attorney
- July 1st:** Dr. Pierpont files as a GOP candidate for the US Senate; Mrs. Bentley drops out of the race; Dr. Pierpont put under police protection after his life is threatened by Black October killers
- July 2nd:** Pierpont campaign tour of state in progress as Baltimore judge dismisses the indictment against him for lack of jurisdiction
- July 3rd:** Case goes to Harford County instead; Harford County Grand Jury indicts Dr. Pierpont.
- Sept. 10th:** Sen. Mathias defeats Dr. Pierpont by 75,000 to 25,000 votes in the GOP Primary Election
- Sept. 21st:** Christine Pierpont (daughter) marries German Baron
- Oct. 17th:** Med-Chi Panel of Peers hears Dr. Pierpont's case
- Oct. 24th:** Med-Chi Panel exonerates Dr. Pierpont

1975

- Sept. 16th:** Trial before Judge Albert Close in Harford County; **acquittal.**
- December:** Milton Allen named a judge by Gov. Marvin Mandel; Dr. Pierpont files suit in US Court for the District of Maryland for \$4 million against Allen and Baltimore Grand Jury Foreman Frederick T. de Kuyper for damages for denial of civil rights, liberty and malicious prosecution

1976

- June 30th:** Imbler-Pachtman Decision of US Supreme Court
- July 19th:** Judge Joseph H. Young dismisses Dr. Pierpont's suit in a summary judgment
- Aug. 12th:** Dr. Pierpont's request for Grand Jury Minutes of his case is denied by Anselm Sodaro, Chief Judge of the Supreme Bench of Baltimore City
- Aug. 19th:** Dr. Pierpont files Appeal to US Court of Appeal's for the Fourth Circuit at Richmond, VA for Grand Jury Minutes
- Nov. 26th:** Second Pierpont Appeal presented to Fourth Circuit Court of Appeals for reversal of judgment in favor of Allen and deKuyper.

1977

- Feb. 9th:** Court rules in favor of Allen and deKuyper; Dr. Pierpont decides to go to the US Supreme Court in Washington, DC
- May 9th:** Appeal filed
- June 14th:** Flimflam charges against Buscemi dropped
- June 30th:** Supreme Court refuses to review Pierpont case

1978

- Sept. 12th:** Dr. Pierpont defeated by J. Glenn Beall in GOP Gubernatorial Primary Election

but later I remarked that we were in real trouble if we couldn't shake this drug rap quickly and permanently.

"Lloyd, (Reynolds—a campaign aide—ed. note), we were promised 100 campaigners here this morning."

"I know, Ross, but everybody is uptight. Watergate, Agnew and all the rest of the political corruption has got the public buffaloed. They don't know what to think or do. Unless we can move out quick, we've had it. Well, it's time to go to Cumberland anyway. Let's go."

The Cumberland Airport is actually in West Virginia. The West Virginia State Police were ready for us. As we hit the runway, we could see a row of riflemen lined up along the crest of a hill perched high on a plateau overlooking the Cumberland Valley.

I was out of the plane first and greeted by one lone campaign aide. He was apologetic and related a whole series of calls with excuses from local politicians whose help we had obviously lost overnight. In discussing it, we all agreed no one could blame these people for their caution.

After all, Nixon had said he was innocent. So had Agnew. So had Dale Anderson, the County Executive of Baltimore County. They were better known than I was and, after all, I had been indicted. Herein lies the tragedy of a system which supposedly leaves a man innocent until proven guilty. Unfortunately, with the immediate electronic media and the press, plus the instant glare of publicity, indictment translates in the mind of the average American to guilt. Our plotters knew full well the impact of what they had accomplished and I must confess their plan was working perfectly.

We went into the small airport waiting room accompanied by two West Virginia troopers, followed by two reporters and the one campaign aide. A rather lengthy press conference was held with a lot of good natured give and take with the reporters. We found here we were traveling faster than the news. Much of what had transpired with regard to the death threats, police protection, etc. was news to these reporters from the Cumberland daily paper and a radio station. They were known to me from other campaigns and we had a very pleasant general discussion. They were sympathetic about my legally-imposed inability to discuss the drug problem.

We left for Hagerstown . . . to a similar reception, with no better, but about equal, results. Then we flew toward the Eastern Shore and Salisbury. I looked at my watch.

"Grace, boys. Cheer up. It's 3:30 PM. I'm not dead yet. It's a beautiful day. We're one-on-one on Mathias, and I'm beginning to feel encouraged.

"You should," Rich Hollander answered.

"What do you mean?" I asked.

"I called the *News American* city desk from Hagerstown. Judge Parrott threw

your indictment out late this morning. I thought you knew it."

"Hell, no! How could we know it? We haven't been in touch since this morning. Are you sure?"

"Absolutely" Hollander echoed.

"Hurray for us!" Everybody yelled at once, talking and laughing.

To say exhilaration took over was putting it mildly. The whole picture brightened and we all knew we could look for better days. We landed in Salisbury and again found only two loyal adherents.

The same excuses we'd heard, but this time we could give an upbeat to the occasion by announcing the latest news. The indictment had been thrown out in Baltimore. This was new information to our campaigners as well as the two reporters from the Salisbury news and the local TV station. We continued to travel faster than the news.

During the news conference, I opened up a little bit about the conspiracy to degrade my candidacy and left no doubt in the minds of anyone that our camp was convinced that Mathias and Mitchell had a hand in the activity with Allen. We were all feeling better than we had all day.

State Police were much in evidence and as the conference broke up one of two plainclothes men came over.

"Dr. Pierpont, I'm Raymond Slye, FBI." He flashed a badge of identification. We will be covering you with the city and State Police until we are sure this Black October episode has quieted down."

"Has there been anything else?" I asked.

"No, but everybody's nervous. These people are kooks. They have no pattern. The fact that your case was thrown out is good news, but it doesn't lessen our problem."

"Why?"

"These kooks frequently don't follow any logic. A lot of the time they don't read. Even if they did, in this situation they might get the tilted notion that you got off on a technicality or by political pull. That might make them worse. No, you are not out of danger yet; so give us a break and be careful and we promise to do our job."

"OK. Thank you very much." I concluded. Everyone was a little looser now and wandering around the Salisbury lobby.

I called out. "Let's get the show on the road. Back to Baltimore."

The Police took up sentry posts and out we went single file into the plane and back to Baltimore. It had been an unusual day. There was room for chagrin. We had been dealt a gruesome body blow in prestige and loss of adherents by the indictment and bad publicity, but then there was room for elation. George Russell had gotten the indictment thrown out and we were clear again, and there was room for reflection—lots of it.

Where do we go from here? Has the throwing out of the indictment removed the stain? Indeed can anything ever remove the stain?

It was increasingly obvious that we were dealing with a vicious adversary world and the higher we climbed, the more severe the buffeting. Could we take it? I guess we were all asking ourselves that question. We believed we could.

Campaign Slurs . . . and Defeat

All along the campaign trail we were hit with slurs and innuendos. "The last of the big time drug dealers;" "Where you gonna get your fix tonight, Pierpont?" "Who's your 'French connection?' etc., but with it all, you could feel the strong underlying schizophrenia of Republican Party feeling against Mathias, a feeling that wanted to be palpably for our side. The vast majority of the Republican party of Maryland didn't want a Mathias it didn't trust . . . If only we could break away from the cloud of this Baltimore City drug indictment, we knew we could win.

I was confident Harford County would not return an indictment. So was George Russell.

The analysis by everyone pointed to a cleaning of the slate in Harford County. With this behind us, we felt confident of a tough battle, but a clear victory against Mathias with all of this trash behind us.

In spite of all our best efforts, what passes for justice frustrated us at every turn and we were stuck: exactly what our enemies had planned. They had gained this end.

In spite of all this, and with a drug charge hanging over my head, I pulled 25,000 votes to 75,000 for Mathias in the election. The public did not want Mathias, but could they vote for an alleged drug peddler?

Amidst the Chaos, a Wedding

(During all the criminal proceedings and political campaigning, the Pierponts were busy planning the wedding of their only child—daughter Christine—to a young German Baron. Dr. Pierpont discusses his feelings during this most trying period.)

It was now obvious I was locked in a death struggle with a problem that had already destroyed a Senatorial career, and now ominously threatened my social, professional and personal existence. To make matters worse, I was isolated, and alone.

Everyone wanted to help me. So many constantly reminded me they were in my corner. Friends and associates volunteered advice and comfort. The attorneys kept trying to explain the reasons for the endless delays and lack of action, but with it all, I felt cornered and alone.

This is a difficult experience. In many ways, in outward appearance, everyone except a few seemed to be on my side,

and yet when you sat down in solitude (and I did a great deal of this, watching more and more TV and never seeing it) you could feel the loneliness settle over you like a shroud. Alone in the crowd—but alone nonetheless.

You cannot make anyone understand this unless he or she has been indicted, pursued, frustrated and put on the line . . .

Trial in Harford County

The Bailiff announced "All rise." Judge Albert Close entered and took his seat on the Bench.

The Clerk Announced:

"Criminal Case #5000, State of Maryland vs. Ross Z. Pierpont. The defendant is charged by indictment for knowingly and intentionally prescribing controlled dangerous substances and prescribing controlled dangerous substances.

The State is represented by John A. Goodman, Esq. The defendant is represented by George L. Russell, Esq. and Freeborn Brown, Esq.

On Aug. 24, 1974, the defendant waived arraignment and entered a not guilty plea and requested a jury trial."

"We will waive a jury trial," I responded.

The Judge: "And by the court, thank you sir. And your plea is not guilty to all charges?"

"Yes it is."

The Judge: "Thank you."

Buscemi testified he was 52 years old, living at 4116 Brandon Ave., Baltimore, MD and that he was not working.

Goodman, "Now, Mr. Buscemi, I see Mr. Russell is looking at the FBI report here. We might as well ask you about your record. You have a lengthy record, is that not true?"

Buscemi: "Yes."

"Dating back to what year?"

"I don't know how far back it goes, but I got a bad record," Buscemi testified.

Goodman: "Okay, more than 20 years?"

Buscemi: "Yes, sir."

Goodman: "What are the nature of these various crimes that you admit to having committed?"

Buscemi: "Mostly all narcotics and largely by trick."

Russell interjected, "And narcotics," he said, "Didn't he say narcotics?"

The Judge: "Narcotics and larceny, as I understand, is that correct?"

Buscemi: "Yes, sir."

Goodman: "The most recent conviction, when was that?"

Buscemi: "I guess it was back in maybe '68 or '65, I can't remember."

Goodman: "What was that for?"

Buscemi: "Larceny."

Buscemi then gave a lengthy testimony of his visit to the Havre de Grace office. The thrust of the testimony was that he came to the office in search of 100 Dilaudid tablets. His reason given for needing the

medication was he was an addict and that he was going to Lexington, KY for treatment at a Federal narcotics center.

He further testified that he was a heroin addict of over 20 years and was in a methadone program at Glenwood Life.

Buscemi testified that he did not complain of pain in his legs the day of the examination, but he did admit to showing his legs to me where scars and recent healing abscesses from drug injections were evident.

He stated that he called the following day, on Monday, and came to my office and I again told him I could give him no Dilaudid and gave him Demerol . . .

George Russell, in cross-examination: "Mr. Buscemi, the State has supplied me with your FBI record and I would like to go over this with you. In 1940, you were convicted of larceny, and you received 30 days in Baltimore City Jail. Is that correct?"

A: "Uh huh."

Q: "In Baltimore, MD, 1954, you were convicted of violation of the marijiuna act and received two years?"

A: "Right."

Q: "In Baltimore, MD, 1954, you were convicted of violating the narcotics laws and received seven years in the Maryland House of Correction, sentence suspended, probation and court costs to be paid, is that correct?"

A: "Yes."

Q: "Also, in 1955, six months for forger; is that correct?"

A: "Yes."

Q: "In Towson, convicted 1961 for violation of the narcotics act for which you received 10 years in the Maryland Penitentiary, which was reduced to three years; is that correct?"

A: "Right."

Table 3: The Cast of Characters

Ross Z. Pierpont, MD:	Surgeon, perennial political candidate (in 1974, candidate in GOP US Senate Primary Election)
Joseph D. Tydings:	US Senator, 1965-71; lawyer
Charles McC. "Mac" Mathias:	US Senator, 1969-present
Parren J. Mitchell:	US Congressman, 1971-present
Milton B. Allen:	Baltimore State's Attorney, 1971-75; Judge, Supreme Bench of Baltimore City, 1975-present
Lt. Leon Tomlin:	Baltimore Police Dept., Narcotics Strike Force
Salvatore Buscemi:	Drug addict, ex-convict, police agent (?)
George Russell, Esq.:	Attorney for Dr. Pierpont
"Black October:"	Gang of killers; murdered State Delegate Turk Scott, a suspected drug dealer
Michael Olesker:	Reporter for the Baltimore News American at the time

Q: "May 19, 1965, you were convicted of grand larceny in Richmond and received one year; is that correct?"

A: "It wasn't grand larceny."

Q: "What were you convicted of?"

A: "False pretense."

Q: "OK. Jan. 18, 1966, you were convicted of larceny by trick and you were

sent to jail; is that correct?"

Buscemi became very agitated at this point and began to argue with Russell.

"It's all there, why don't you read it?"

Q: "September, 1966, in Baltimore, you were convicted of false pretense; you got five years, correct?"

A: "That is right."

SEPT. 21, 1974: THE WEDDING. (From left to right) Dr. Pierpont, daughter, daughter's husband and Mrs. Pierpont. The smiles covered a tension that all felt.
(Photo courtesy of the Pierponts.)

Q: "May 6, 1961, convicted of shoplifting—\$100 and costs, correct?"

A: "Yes."

Q: "You stated under oath today, nobody promised you anything?"

A: "Right."

Q: "Did Mr. Goodman promise you anything?"

A: "No sir. I just met Mr. Goodman this morning."

Q: "I'm very glad to hear that. Did Lt. Tomlin promise you anything?"

A: "No, sir."

Q: "Did Milton B. Allen promise you anything?"

A: "No, sir."

Q: "All right, now tell me where are you? Are you out on bail now or are you in jail?"

A: "I'm out on bail."

Q: "Now, where and when were you in jail—beginning from today back?"

A: "I was in the Baltimore City Jail."

Q: "How long?"

A: "Well, I was in Howard County and Baltimore City Jail all told, two and a half months."

Q: "I notice your hand Mr. Buscemi. Isn't that sclerosis?"

Buscemi stalled.

Q: "Isn't that venal sclerosis?"

A: "Yes, this is from using drugs. What are you trying to say?"

A: "I am just asking you a question!"

A: "Yes, you are right, you know, the many cases you handled."

Q: "I know. Now you have that all over your body, don't you Mr. Buscemi?"

A: "Yes."

Q: "Is there any part of your body that does not contain the sclerosis, other than your face?"

A: "Yes, sure it is!"

Q: "Is it in your feet; is that correct?"

A: "Yes."

Buscemi became very agitated and objected to Russell's questioning, but Russell bored in. Goodman objected.

Russell to Goodman: "You stipulate that he has venal sclerosis all over his body, and I won't make him take his clothes off."

Goodman: "I don't know the relevance of whether he has it over 70 or 80%!"

Russell: "If I, as an untutored person, can recognize venal sclerosis, certainly a physician can!"

Goodman: "I am not disputing it."

Russell bored in again: "OK, do you know that your eyes indicate heroin addiction?"

A: "Sure, I know it."

Q: "So you realize that a trained person can look in your eyes and know you are a drug addict?"

A: "Right."

Russell pointed out to Buscemi and the court Lt. Tomlin's solicitude for Buscemi's welfare. He showed Tomlin getting Buscemi out of jail. He accused

Tomlin of "judge shopping" in Baltimore County for Buscemi to get bail and stetting of cases. There was no question in anyone's mind when Russell completed this line of questioning that a serious, nefarious, unsavory relationship existed between Lt. Tomlin and the Baltimore City Police Department and this con man, admitted narcotics addict and larcenist, Salvatore Buscemi.

Tomlin testified he had been with the Baltimore Police for 15 years with eight years in the Criminal Investigation Division narcotics unit. He had known Buscemi 12-14 years and repeatedly denied making him a deal for his testimony . . .

The Journal Introduced as Evidence

Later in the trial, Mr. Russell questioned one of the State's physician witnesses: "Would you read the *Maryland State Medical Journal*, August, 1974, page 17?"

The witness read aloud: "New Federal Statute took effect on May 18, 1974 which prohibits a physician from maintaining an addict on any opiod for longer than 21 days without filing an application for the operation of a drug program for the treatment of addicts. Any physician who may be prescribing or dispensing for addicts for longer than 21 days should assure that he is in compliance with the Laws" . . .

Russell moved for acquittal. He pointed out that the State's two experts had literally exonerated me. He pointed out there was no motive for profit, having only collected \$15 for a first visit and still being owed \$10 for the second. Russell further pointed out the character of Buscemi and Tomlin versus the character of Pierpont and many other cogent points . . .

At Long Last . . . Acquittal!

(From the trial transcript, Judge Close concluded:

"All right, gentlemen, I think if you will recall, that in ruling on the motion, the Court decided that indeed someone outside of the medical profession, whether it be a judge or a jury, instructed by the judge, could decide whether or not the doctor had—within the language of the act, acted in conformance with the standards of the medical profession, and we simply said that in arriving at some decision with regard to this issue that we judged it by the conduct of the doctor measured in the light of common understanding and practices. And to enable a court or a jury to understand what the common understanding or practices are, we call on people in the medical profession to help us, and that is exactly what happened in this case, and it doesn't seem to me, sitting here, having listened to the adversaries, whose adrenalin is up, that it may be exactly what you feel it is on each side. The State's witnesses . . . both had some difficulty in saying for certain that this particular defendant, who is under what we call a common practice, and not

the proper practice, had done anything that was not in accordance with the common practice. And, of course, they had not heard all of the testimony in the sense that they had not heard the defendant's side of the case.

"Now, I want to say that this is a very serious matter, not only to Dr. Pierpont, but also to the medical profession who have come late, so to speak, in the writing of the rules of conduct, as compared to the legal profession, which has for years gone by had a code of professional ethics. And I say this only because I was involved in the Collahan case, and it seems to me that there about began the time when the Medical and Chirurgical Faculty did adopt some rules, which later became codified in the laws of the State. And here again, we separate the criminal charge from the professional conduct aspect of this thing in the same way we would with a member of the legal profession.

"Now, I am not so certain in my own mind that if there had not been a display in Baltimore City which gave rise to a great deal of publicity across the land with regard to this particular defendant, who is prominent in his profession, but also is a public figure, that perhaps there might not have been an indictment in Harford County had the thing been initiated in the beginning, on the basis of what the Grand Jury might have heard. And, of course, I don't know what they heard, but I know what I have heard, and I think that a great burden fell on the Grand Jury, the State's Attorney's Office here, and I certainly want to commend Mr. Goodman, who I know is really not enjoying greatly the fact that he is required to participate in this case, nor perhaps is Mr. Russell, but I don't find beyond a reasonable doubt and to a moral certainty, from the evidence that I have heard, that the defendant in this case did not act in accordance with his regular professional duties under the first count, knowingly and intentionally in prescribing the drug in this instance, or two instances, three if we take on the Demerol. Nor do I find with respect to the second count that it is surely beyond a reasonable doubt and to a moral certainty that he was not in conformance with the professional standards. And, God knows, I don't think I am qualified, really, to say whether he was even careless, or used bad judgment. His peers have expressed themselves on that, so the Court finds the defendant not guilty under each count of the indictment.

"I want to commend counsel, really, in this case for their fairness with which they have conducted this inquiry. And I guess that perhaps this may be really the first inquiry of this type, under the statute, and I could be wrong as rain, for that reason, but I'm only going on what my visceral feelings may be, along with whatever evidence was adduced before me. Thank you very much. (Whereupon, the trial was concluded.)

(Dr. Pierpont was acquitted. He resumes his narrative.)

I jumped up and thanked the judge and bedlam broke out in the courtroom. Russell and Freeborn Brown were congratulating each other. Grace leaned over the rail and hugged and kissed me . . . Friends cascaded out of the spectator area to surround all of us. Brooks Bradley, an old mortician friend from Dundalk, and John Conway were slapping one another and me on the back. It was a happy scene . . .

Squeezing thumb and forefinger together, I said "We were that close to medical, personal and public oblivion."

Grace was crying . . .

It was finally a brilliant happy ending to the most sordid episode of an active lifetime. Now to deal with the connivers who perpetrated the act. Could justice really be done? We would see, but from the other side of the coin!

Some Reflections on US Justice Today

(Later that day, Dr. Pierpont revealed his intentions to countersue Allen and Tomlin to his wife, Grace, explaining:)

"There is general tragedy and malaise in justice over the country today and we're at the vortex of it. What I'm driving at is our dual system of justice. I'm sure if I had been some liberal, everything would have been dropped immediately, but I'm branded as a conservative. All conservatives are fair game for the liberal warped prosecutors in today's justice system. They have a complete double standard. If this were not so, how is it that the liberals are never prosecuted?"

"What do you mean?"

"You want examples?"

"Yes."

"Well, first let's just list a few. Teddy Kennedy. Practically every thinking person suspects murder at Chappaquidick with the death of the Kopechne girl. Where were the prosecutors? Why wasn't she autopsied? Why wasn't Kennedy tried? Why did he pay the Kopechne hush money? Then Lyndon Johnson, what about him? Why did the US Senate let Bobby Baker plead guilty and disappear to jail? He got a very light sentence. Why not a Senate investigation? This would have made Watergate look like a second-rate cops and robbers game, which it was. Probably half the Senate would have gone to jail. While on the Johnsons, how did Lyndon and Lady Bird get so wealthy? Why no official investigation? They did it all on a public salary. Then what about good old Hubert Humphrey? He got caught with his arm in Gulf Oil money up to his shoulder blades. But what happened? The liberal prosecutors and press just turned their heads and said Hubie needed the money. It was a different story with Hugh Scott. Press and prosecutors wanted to railroad him out of the Senate. He resigned . . .

Grace interrupted, "But weren't those people guilty? Agnew, Anderson, Alton, Jones and now Mandel, Kovens and Hess?"

"In a sense, yes, Grace, they were all guilty, but then so was every other official in public office that you and I have known. All were guilty of one problem or another of what these people have been charged with or proven guilty of; the granting of favors in exchange for support or sustenance. But the problem is this, why only the conservatives persecuted and prosecuted? This double system of justice is not happenstance.

I continued: "I've done a lot of thinking. I don't condone any of the bribery, shakedowns, etc. You know how I held press conferences in Kovens' store in 1971 running against Don Schaefer and detailed all of the things they are bringing out in Mandel's trial, not as crime, but as iron-fisted political control by Kovens.

I argued against giving Irv Kovens that same iron-fisted control over Baltimore City that he had over the State of Maryland. The liberal press wasn't interested . . .

The Countersuit

We filed the suit in December, 1975. There was a flurry of activity in the press for a short period, principally caused by the fact that Milton Allen was now a Superior Court Judge of Baltimore City, Judge Milton Allen, by appointment of Gov. Mandel.

I had been successful in persuading Mandel not to appoint Allen for several months. Finally, the pressure of Parren Mitchell, coupled with Mandel's needing sympathetic jurors for his upcoming trial on charges of bribery, overcame all objections. These charges against Mandel were coming through the radically-controlled US prosecutor's office of Baltimore City and the trial would be in Baltimore. Favorable sentiment was necessary for Mandel, Kovens, Hess and Rogers.

In fairness to Mandel, he gave me the courtesy of a call just prior to the appointment of Allen and literally apologized for the necessity of such an appointment to the bench, but such is politics and justice. The liberal newspapers applauded this appointment.

Meanwhile, the Supreme Court's Imbler-Pachtman Decision . . .

This, unfortunately, had come down on June 30, 1976 while a judge had our problem under consideration. Imbler-Pachtman literally guarantees absolute immunity and lack of accountability to prosecutors.

As an example, anyone of you reading this can be indicted, tried and jailed by any prosecutor or assistant prosecutor, knowingly and wilfully using liars, thieves, entrapment and trumped-up evidence. You can prove all of this beyond any reasonable doubt, and yet, under the Imbler-Pachtman decision of the Supreme Court, the prosecutor or State's Attorney is immune from redress. Such is today's

tyranny in the Courts and prosecutor's offices in this US!

(Ultimately, Dr. Pierpont carried his case to the Supreme Court of the US, which notified him on June 30, 1977 that it would not review it, meaning that he'd lost his countersuit. Despite the fact that the Baltimore City Grand Jury notes relating to his original indictment revealed the fallacy of the State's 1974 case against Dr. Pierpont—the same case it would later lose in the Harford County trial—the Supreme Court decided that its earlier Imbler-Pachtman decision guaranteed prosecutors, etc. immunity from prosecution themselves. Dr. Pierpont takes up the story:)

This was expected; however, it was necessary to make the entire effort to obtain justice, otherwise our liberal civil rights advocates could always say we hadn't gone far enough in the system.

We had now thoroughly tested the system from it's shabby, politically-controlled, corrupt beginning, through the various political judicial protective associations, to the bitter end.

You would hope for a progressively-enlightened, more intelligent approach to justice in your progress through the upper echelons of our criminal justice and judicial systems. Depending upon your problem, there is serious question from a practical standpoint whether this occurs.

Certain questions are obvious. Is it possible to obtain justice in this United States today? . . .

We must conclude that justice for the prominent, well-to-do, white man is very elusive. If the individual is conservative and politically active as I was, justice, except as I finally barely escaped with my hide, is nearly impossible . . .

On the other side of the judicial coin, in today's market, the liberal and the penniless have the best of it. Why is this true?

The general guilt complex, which swept through the nation following the civil rights movement successes, is now very prominent among today's judiciary and criminal justice systems. Everyone bends over backwards to make sure the liberal and the penniless are given every consideration and break possible. This warping was bound to occur.

As an example, an Angela Davis goes free, but a Patricia Hearst has great difficulty. Of course if you are big enough to corrupt the system completely, you can be white, as in the case of Sen. Ted Kennedy at Chappaquidick. They didn't even autopsy the girl, much less tear holes in a Swiss cheese story, but here we are dealing with a white liberal, and in such hands if the individual is high enough and rich and powerful, the bending of the system can be accomplished. In this instance, it was.

What is the significance of all of this to the average citizen?

The judiciary of this nation and their controlling position within the criminal justice system represent the last bulwark

between the citizen and tyranny of the State.

If the judiciary, for whatever reason, fails in its even-handed administration of justice, we are face-to-face with State tyranny. This is indeed tyranny of the State by the judiciary and therefore under the law.

These are frightening concepts. With the Imbler-Pactman decision, these concepts have indeed become truths. Our Supreme Court has literally decreed tyranny of the State by the criminal justice system. We must now depend on the integrity of each and every prosecutor and his assistants in this nation.

What will happen under someone disposed to silence opposition?

With properly-utilized and rewarded State's Attorney's, the opposition can be silenced.

You say it can't happen? It happened to me. It happened to Imbler. It has and is happening to others.

What can be done?

Some way, somehow, the Supreme Court must be persuaded to rescind the Imbler-Pactman decision. It is bad enough that the judicial and legal buddy system makes the bringing of a lawyer, judge or prosecutor to task for injustice nearly impossible. It defies all reason that prosecutors should be added to judges as sacrosanct individuals with no accountability for their individual actions.

What about justice?

I really don't know. Do you?

Epilogue

The long search through human history for equitable justice has been one of infinite difficulty. On the one hand, it is necessary to have an orderly society while constantly attempting to protect the individual liberties of each citizen. In this conflicting environment, equitable justice frequently hangs finely in the balance.

Our efforts in the US to turn the courts of our nation into a quasi-everyday revision of legislative decision-making and the recent readiness of the court to accept this role (and indeed to "discover" in the constitutional text a basis for detailed legislative precepts in a variety of fields) is bound to lead to a distortion of the division of powers. This activity is rooted in the assumption that fundamental rights of the citizen are constantly endangered by their elected representatives, and that judges who have been selected indirectly or by inter-party compromise represent a "superior" kind of objectivity compared with representatives of the people elected on the basis of an openly proclaimed political program.

This is bound to discredit the democratic process whose results are subordinated to a "non-partisan" interpretation of the law, and to blur the delicate but vital borderline between the necessary review of a democratic decision under the rule of the law and this gradual replacement by the transgressions of a "rule of judiciary." Finally, this discredits the judges themselves, increasingly tempted into political

judgments, pronouncements and decisions beyond their competence.

Thus, we see the judiciary of our US overreaching the conceptual bounds of our democracy attempting to fulfill aims beyond the responsibility of the judiciary and, in point of fact, becoming oppressive to the very society it serves. What may start as individual oppression could extend rapidly to engulf large segments of our citizenry.

With the existence of a problem of this magnitude, the salvaging of an occasional malicious prosecutor is not worth the price of a possible oppressive society—as exemplified by the Imbler-Pactman decision.

The means to control such an activity are at hand in Congress of the US. Laws must be enacted to contravene Imbler-Pactman-type decisions, and consideration must be given to laws to question the absolute sanctity of judges. Oppression by any branch of government is intolerable in a free, democratic society.

An examination of the operation of the Narcotics Strike Force under Mr. Allen and Lt. Tomlin is interesting. These two used \$800,000 in LEAA Federal funds over a three-year period and had involved over 100 physicians before the Baltimore City Grand Jury. With the uproar over my indictment, this number for indictment dropped to 10. Upon my acquittal—and my willingness to testify against Allen, Tomlin and Buscemi—the present Baltimore's City State's Attorney, William Swisher, dropped all charges against all physicians.

This Narcotics Strike Force expended several millions of our tax dollars and didn't get one conviction.

Postscript . . .

(On June 14, 1977, the Baltimore *Evening Sun* carried the following story, entitled *Eight Flimflam Counts Are Dropped*:)

"The Baltimore State's Attorney's office has dropped eight flimflam charges against Salvatore L. Buscemi, a reported informant prosecutors kept out of jail for 28 months despite a continuing string of arrests.

"Buscemi, 53, a convicted flimflammer and drug addict and former scion of his family's now-defunct sausage business, is

in City Jail awaiting trial Aug. 12th on two other flimflam charges dating back to last year.

"He surrendered to the City Sheriff December 14th a few days after a bench warrant was issued for his arrest on a probation violation charge by Chief Judge Anselm Sodaro of the Supreme Bench.

"The dropped charge involved about \$1,100 worth of alleged loot from flimflams dating back to the summer of 1974. They were dropped in return for Buscemi's testimony as the State's key witness during the 1975 drug trials of Dr. Ross Z. Pierpont, who was acquitted.

"Prosecutors agreed to drop the old charges and had gotten Buscemi a suspended sentence on a trespassing charge in early 1976, but cut off further intervention in his behalf before he was arrested on the later charges.

"The two open charges allege that Buscemi bilked a Riviera Beach woman out of \$400 for two color TV sets that were never delivered in April, 1976, and allege that he was the accomplice of a woman arrested for taking a \$60 payment from a plainclothes state trooper for another TV set in October, 1976."

"I'm not an out patient!, . . . I'm an IN patient!"

The Great Laxative Escape

COLACE[®]

dioctyl sodium sulfosuccinate

Colace means escape—from laxative stimulation, from laxative harshness, from laxative habit. Colace gently helps soften stools for easy, painless, unstrained elimination. It's the great laxative escape, from infancy to old age. Available in 100 and 50 mg. capsules. Syrup or liquid.

Mead Johnson

PHARMACEUTICAL DIVISION

COMPATIBILITY

Eastern Tiger Swallowtail Butterfly
(*Papilio glaucus*)

Does it influence your choice of a peripheral/cerebral vasodilator*?

Vasodilan—compatible with coexisting diseases (e.g., glaucoma, diabetes)

Vasodilan has not been reported to affect the course of coexisting disease; it has not been reported to affect blood sugar levels or to raise intraocular pressure.

Vasodilan—compatible with concomitant therapy

Vasodilan has not been reported to affect the treatment of coexisting disease; it is compatible with such drugs as hypoglycemics and miotics.

Vasodilan—compatible with your total regimen for vascular insufficiency

Vasodilan can be a valuable adjunct in planning a total therapeutic program for vascular insufficiency.

***Indications:** Based on a review of this drug by the National Academy of Sciences-National Research Council and/or other information, the FDA has classified the indications as follows:

Possibly Effective:

1. For the relief of symptoms associated with cerebral vascular insufficiency.
2. In peripheral vascular disease of arteriosclerosis obliterans, thromboangiitis obliterans (Buerger's Disease) and Raynaud's disease.

Final classification of the less-than-effective indications requires further investigation.

Composition: Vasodilan tablets, isoxsuprine HCl, 10 mg. and 20 mg. Vasodilan injection, isoxsuprine HCl, 5 mg., per ml.

Dosage and Administration: Oral: 10 to 20 mg., three or four times daily. Intramuscular: 5 to 10 mg. (1 or 2 ml.) two or three times daily. Intramuscular administration may be used initially in severe or acute conditions.

Contraindications and Cautions: There are no known contraindications to oral use when administered in recommended doses. Should not be given immediately postpartum or in the presence of arterial bleeding.

Parenteral administration is not recommended in the presence of hypotension or tachycardia.

Intravenous administration should not be given because of increased likelihood of side effects.

Adverse Reactions: On rare occasions oral administration of the drug has been associated in time with the occurrence of hypotension, tachycardia, nausea, vomiting, dizziness, abdominal distress, and severe rash. If rash appears the drug should be discontinued.

Although available evidence suggests a temporal association of these reactions with isoxsuprine, a causal relationship can be neither confirmed nor refuted.

Administration of single dose of 10 mg. intramuscularly may result in hypotension and tachycardia. These symptoms are more pronounced in higher doses. For these reasons single intramuscular doses exceeding 10 mg. are not recommended. Repeated administration of 5 to 10 mg. intramuscularly at suitable intervals may be employed.

Supplied: Tablets, 10 mg., bottles of 100, 1000, 5000 and Unit Dose; Tablets, 20 mg., bottles of 100, 500, 1000, 5000 and Unit Dose; Injection, 10 mg. per 2 ml. ampul, box of six 2 ml. ampuls.

U.S. Pat. No. 3,056,836

VASODILAN[®] 20-mg tablets

(ISOXSUPRINE HCl)

20 mg q.i.d. recommended dosage

This asthmatic isn't worried about his next breath...

**he's active
he's effectively
maintained on**

QUIBRON[®]

Each capsule or tablespoonful (15 ml) liquid
contains theophylline (anhydrous) 150 mg
and glyceryl guaiacolate (guaifenesin)
90 mg

- theophylline for effective
around-the-clock
bronchodilator therapy
- 100% free theophylline

Indications: For the symptomatic relief of bronchospastic conditions such as bronchial asthma, chronic bronchitis, and pulmonary emphysema.

Warnings: Do not administer more frequently than every 6 hours, or within 12 hours after rectal dose of any preparation containing theophylline or aminophylline. Do not give other compounds containing xanthine derivatives concurrently.

Precautions: Use with caution in patients with cardiac disease, hepatic or renal impairment. Concurrent administration with certain antibiotics, i.e. clindamycin, erythromycin, tetracycline, and streptomycin, may result in higher serum levels of theophylline. Plasma prothrombin and factor V may increase, but any clinical effect is likely to be small. Metabolites of guaifenesin may contribute to increased urinary 5-hydroxyindoleacetic acid readings, when determined with nitrosonaphthol reagent. Safe use in pregnancy has not been established. Use in case of pregnancy only when clearly needed.

Adverse Reactions: Theophylline may exert some stimulating effect on the central nervous system. Its administration may cause local irritation of the gastric mucosa, with possible gastric discomfort, nausea, and vomiting. The frequency of adverse reactions is related to the serum theophylline level and is not usually a problem at serum theophylline levels below 20 mcg/ml.

How Supplied: Capsules in bottles of 100 and 1000 and unit-dose packs of 100; Liquid in bottles of 1 pint and 1 gallon.

See package insert for complete prescribing information.

Part 3: A Doctor's Political Life:

An Exclusive Interview with Ross Z. Pierpont, MD

By BLAINE TAYLOR

His Candidacies

Why have you run so many times?

Well, I've always run with very specific purposes, and I've **not** always run because I thought I could **win**, particularly, but felt that my running would be a material factor in someone else **not holding** that office, which I thought at the time was terribly important.

In 1966, the drift to the political left in the Democratic Party had been very marked. In the Democratic Gubernatorial race that year, there were seven candidates running, and the principal ones were George Mahoney—who **did** win and become the nominee—and Carlton Sickles. There were three conservatives opposed to the very liberal Sickles, an advocate and personal friend of the Tydings-Kennedy combine of left-side liberalism. I thought that, unless **something** was done to obviate that, Sickles would win. I felt that Sickles' winning at that time in the Primary would've been tantamount to election in the General. Another part of this was that I was very close then to Ted Agnew. We were playing golf together. Actually, I didn't decide to get into the race until late in June. I realized that, in the minds of the public, the terms "black" and "liberal" meant the same thing. My feeling was that, if we could formulate a black-white ticket—which made sense, anyway—and run across the state with it, it would be helpful. If we ran well in black areas especially, I felt we might well give Sickles problems enough that he would lose. I was, therefore, the first person statewide to run shoulder-to-shoulder with a black candidate . . . in that case, Archie Williams, who ran for Comptroller.

On that premise, I went to the black community—to the late Dr. Carl Murphy, publisher of the *Afro-American Newspapers*, to Jua-

nita Jackson Mitchell from the civil rights movement and to two or three professors at Morgan State University—in an effort to present a black-white ticket to the state. They selected Archie Williams.

We only got 4,500 votes, but they were all votes in key areas where Sickles needed them. Mahoney beat Sickles by 1,800 votes. In one key precinct in Anne Arundel County where Sickles was beating me by 20 to 1, there were a thousand votes where the levers didn't register for either Sickles or myself. We both challenged for those votes—so, they were thrown out. That would've put him within 800 votes of Mahoney had Sickles won those votes, and I believe they would've counted George out in the recount. That was the end of Sickles' elective career when he lost.

Ted Venetoulis of this past year's race was in his camp, too. I supported Agnew in the General Election.

1968

In 1968, I ran as a Democrat against the incumbent US Senator Daniel Brewster, in which I polled some 40,000 votes. I didn't want Brewster to be reelected. I'd asked several other people to get in the race, but nobody would. It was obvious at that time—and the *Journal* carried the story later—that Brewster had a problem with alcoholism. There wasn't any question in my mind that he was disabled by this.

In the 1968 campaign, one of our ads said that "We pledged sober thought," and this elicited great yelps of pain from the Brewster camp because they claimed we were saying he was a drunk! I didn't think Brewster was a satisfactory Senator. He wasn't doing the job and should be replaced, I felt.

When Brewster defeated you in '68, did you support him or Mathias in the General Election?

I supported Brewster because I

found Mathias extremely wishy-washy. In talking with Brewster after the Primary, I found that he'd straightened himself out a good deal. He wasn't drinking and looked well.

The 1968 race was the time I really got to be known around the state, as I spent \$250,000 of my own money and an additional \$160,000 of other money in the campaign.

Money Spent

How much do you think you've spent in total in all your campaigns over the years?

Around \$450,000.

Is it a true statement to say that you're a millionaire?

I think it's fair to say. The newspapers all say it! Yes, I've made some money—worked hard and been successful. I've done all right that way. Money's not been the problem. I've spent it in the political game. I've gotten alot out of the country, and I've given alot back to the country.

That's one of the reasons I've run. I've felt very strongly about trying to put this nation together. Through this entire thread, I've been a "Proposition 13" type of individual **against government** spending and **for** fiscal responsibility and **for** the great necessity to operate on a prudent fiscal basis so we don't become strung out like so many democracies have in the past and lost their identity by going bankrupt. You have no friends when you're broke! The US will be no different. All the "friends" we think we've bought will leave us very promptly!

A Spoiler?

Would you call yourself a spoiler, in that you go into races not necessarily to win yourself, but to defeat someone else?

I guess that's a proper connotation, but I'd rather think of myself

as an activist in pursuit of principles in which I believe. I oppose those who **don't** hold those principles.

Changing Parties

Why did you ultimately decide to become a Republican?

I finally left the Democratic Party when I saw the McGovern business coming about—the terrible debacle of left-side extremism within the Party. I saw that the only sensible way was to support people who could manage the country—people who had their feet on the ground considerably more than the Democrats, and that led me to the Republican Party.

The 1970

Anti-Tydings Campaign

Let's talk about the Tydings race in 1970.

As I said, in 1968, I was concerned about defeating Brewster for reelection. Even **more** than that though, I was concerned with the advent of 1970 Tydings activity.

Because of **that**, I was very interested in getting around the state in anticipation of the '70 race. During 1968, I found out something that no one else really knew.

Everyone thought that Tydings was unbeatable in 1970, but everywhere I went—from Western Maryland to the Eastern Shore—the Democratic leaders said to me "We know everything you're saying about Brewster is true, but he's never done us any harm, even though he's not done us much good. We're not going to hurt him. You come around in 1970 when Tydings runs, and we'll be with you 100%."

Why didn't they like Tydings?

Not only didn't they like him, they actually **detested** him! It was amazing! I was even surprised myself at the depth of feeling **against** Tydings. They didn't trust him at **all**, they felt he was totally lacking in integrity, was out for himself, was a climber and was using them purely and simply to further his own ends. He let everybody down and ran roughshod over them when it suited his own interests best.

How do you find Tydings as a person?

I was Joe's personal family surgeon. I knew him very well. We fell out when he backed the Baltimore bankers, who were at one time interested in keeping blacks out of the downtown sector in the late 'Sixties, although many of them now would deny that. Some of us had designed an anti-poverty bill that was on Sargent Shriver's desk in Washington for signature and Tydings killed it on the behest of the bankers, whose financial backing he needed in 1970.

Do you think he was a phony liberal?

Yes. It was just a facade that meant nothing.

What do you think Tydings' "own interests" were?

He hung around with the Kennedys. He thought he might be Vice Presidential or Presidential timber or whatnot. He was totally bent on climbing upwards.

Originally, I had the complete approval of the Democratic machine to run against Tydings, but I realized that I wasn't sympathetic to the way the Party **itself** was drifting—leftward. After examining at length my own conscience, I asked a number of my Democratic supporters if they'd still back me if I switched Parties and ran as a Republican. They said they would. I think I could've won that seat in the Senate in either Party's Primary, because of my well-known independence.

I then saw Rogers C. B. Morton—the Chairman of the GOP National Committee—who showed me polls stating that Tydings couldn't be beaten. They weren't even going to run anybody against him! They were anxious that I become a Republican when I said I would. That was in August, 1969, when J. Glenn Beall—then a Congressman—said he wouldn't run against Tydings.

In January, 1970, I saw them both again and they said they'd back me if I changed Parties, but they said it was hopeless anyway. I changed in February. We organized the Citizens Against Tydings and, in six weeks' time, turned those polls from "can't lose" to "can't win!" In May, 1970, Morton told me—after I'd burned my bridges behind me—that Nixon

wanted to run Beall against Tydings. We had a bitter confrontation over it.

They wanted **me** to run instead for Congress against incumbent Clarence Long, which was a hopeless thing.

Why did you?

They promised me \$100,000 for that campaign, but I only got \$6,000. Even though I lost, I got more votes against Long than anyone else ever has. The most important thing to me, though, was that Tydings be defeated, so I didn't want to run against Beall in the Primary, as I felt it would help Tydings win in the General. I think I would've made a good Senator, but I'm more interested in the country than in myself.

On the Kennedys

I gather from the tone of what you said earlier that you were partially against Tydings because of his ties with the Kennedys. Don't you like them?

I don't **trust** them—and I think with good reason! They're advocates of much social change, and socialism itself is great for those who have everything, because nobody else can reach them. It's an ideal gambit for the man on top. They've been opportunistic. With the tremendous amount of money they have, they control the media. It's rumored they spend \$20 million a year for this across the country. If you don't notify the press about something, they don't look for you—and the Kennedys' notification is ample.

I think they're relatively dangerous to our people to this country.

What kind of a President do you think Robert Kennedy would've made?

Dangerous—very dangerous! He was a megalomaniac of the worst sort. The Kennedys approach the baser concepts of people—the poor and the inept—and promise them everything. Well, that's fine to do and looks great, but if the Republic collapses because of it, is it a good plan? I doubt it.

Do you think that will happen?

I think it's showing some very bad cracking in the seams now, al-

though I hope it doesn't. We have reason to be concerned, however.

What about John Kennedy—do you think he was that bad a President?

He was the best of the Kennedys. As for Ted, I think school has to be out on the Chappaquiddick incident. My goodness! If that had been anyone of us, we'd still be in jail up there trying to explain why we didn't have an autopsy and how we managed to subvert it. That's an open book.

I do get a big kick out of him in his Senate judicial work in which he's advocating uniform punishment for everyone! That's rather ironic! He used every position that he and his family had to bury the Chappaquiddick evidence.

Chappaquiddick

Now wait a minute. He went to trial. He was charged with a traffic violation—a misdemeanor—pleaded guilty and lost his license to drive temporarily. I've read the entire transcript of the trial. The State's Attorney there did not request an autopsy in that case until after the body of the girl had been removed by her family to her native Pennsylvania. By the time he did, they'd buried her and refused to exhume her. The State's Attorney was not a Kennedy supporter and, in fact, in the previous election, Ted Kennedy had campaigned against his reelection, so certainly there was no love lost there between them.

Well, I don't know just how they worked it.

But you just have a feeling that they did, right?

Well, we've all been around too long to know that—with all that power going on—they got that body away. A considerable sum of money changed hands—what was that for?

I don't know that that happened.

Well, had the accident occurred in Maryland, there's no way anyone would escape an autopsy forthwith within a short time!

Yes, I know. Dr. Russell Fisher—the State Medical Examiner—told the Journal that in an interview published two years ago.

A tremendous cloud remains over these people.

If Chappaquiddick hadn't happened, you'd still be against Ted Kennedy, wouldn't you?

Not necessarily, but I think it's a defect in his character. There's also his cheating record at Harvard University. I think he'll do anything to get himself ahead. He's not one to be admired or entrusted with the US' business. I don't trust the Kennedys basically because of their latching onto socialistic issues which they don't indulge in themselves, considering the opulence of their lives, their tremendous holdings, tax-protected monies, etc., and, yet, they advocate all of this suppression for everyone else.

The 1971 Mayoral Race

Why, in 1971, did you run against Schaefer for Mayor?

The Republicans had no one else to run! In that race, I ran again with a black running mate for Comptroller, Mrs. Margaret Dyer. We spent \$135,000 and Schaefer spent \$785,000. Schaefer has been a hard-working Mayor, but he's bullheaded and can't control his bureaucracy, like any Democrat.

The 1974 Mathias-Mitchell-Allen "Conspiracy"

In your book, you allege a conspiracy against you by Sen. Mathias, Congressman Mitchell and Milton Allen. Knowing all these people myself, I find this premise hard to believe, nor do I feel you were that important to them in 1974. I don't see that you were that great a threat to Mathias to necessitate such a "grand alliance." What's your reaction?

I think some of it was happenstance, as so many things are, but not all of it, as the book points out. I don't think they had a grand meeting to disable me or Helen Bentley. Mathias never stated during the entire campaign that he didn't believe the drug charges against me, however.

Had you won the GOP Senate Primary in 1974 over Mathias, do you seriously believe you could've defeated Democrat Barbara Mikulski in the General Election?

Yes. She wasn't well-known then statewide, whereas I'd been around the state three times.

Do you still want Tomlin and Buscemi indicted for perjury?

I did, yes.

The 1978 Gubernatorial Contest

You played a significant part in defeating Glenn Beall for Governor last year by bringing up—even more than Democrat Harry Hughes did later on—the 1970 Nixon money scandal in which Beall was involved. Did you want Beall to lose the General Election?

That wasn't the point. I didn't think he could be elected. I didn't want to run, but wanted Robert Pascal to run instead. He wouldn't, so I got in.

Future

Are there going to be any more Pierpont campaigns?

Oh, I don't know. They call me a "perennial candidate," but I've only been at it for 12 years. We've made so much racket that everybody thinks we've been here forever!

Thank you, Dr. Pierpont. ☐

Doctors in the News

Dr. Gunning Appointed Medical Director at St. Agnes Hospital in Baltimore

Jean-Jacques Gunning, MD has been appointed to the position of Medical Director at St. Agnes Hospital in Baltimore. In his new capacity, Dr. Gunning is responsible for medical affairs and patient care and the coordination of medical education as it relates to the post-graduate programs in medicine, obstetrics/gynecology, pathology, pediatrics and surgery.

Dr. Gunning, a native of Baltimore, received his Medical Degree from the University of Maryland's School of Medicine in 1954, after obtaining his undergraduate AB degree from Loyola College in Baltimore. He served as a senior intern at the San Diego Naval Hospital in California, completed his residency in medicine at the US Naval Hospital in Boston, and is certified by the American Board of Internal Medicine.

Prior to assuming his new post, he served as an Associate Professor on the Clinical Faculty of the Department of Internal Medicine and Infectious Diseases at the Univer-

DR. GUNNING

sity of California's (Los Angeles) Harbor General Hospital. Dr. Gunning was the health care coordinator for Indo-Chinese refugees at Camp Pendleton, CA, and is currently an Associate Professor at Louisiana State University Medical School in New Orleans.

During his assignment at Camp Pendleton, he served as Director of Clinical Services and Chief of Medicine, and as Chairman of Graduate Training of the US Naval Regional Medical Center.

In 1971, Dr. Gunning was a delegate for the US to the Southeast Asia Treaty Organization Medical Planning Conference at Bangkok in Thailand.

During the late 1960s, Dr. Gunning's naval medical career took him to the Republic of Indonesia, the Republic of China and the Republic of South Vietnam. While in Vietnam, he served as Chief of Medicine with the US Naval Support Activity Hospital in DaNang.

In addition, Dr. Gunning has served as the coach of the Ocean-side Swim Club in California, and as an American Athletic Union (AAU) swimming referee in the Pacific Southwest Association.

He holds memberships in the AMA, the American Society of Tropical Medicine and Hygiene, I Corps Medical Society, Taipei International Medical Society, Federal Health Care Executives Institute Alumni Association and the Alpha Omega Alpha, National Honor Medical Society.

Dr. Gunning was awarded the US Naval Meritorious Service Medal in 1976, the Community Service Award from the City of Oceanside, CA in 1973, the Armed Forces Legion of Merit Award with Combat V in 1969 and in 1968 received a Meritorious Diploma from the Instituto de Medicina Tropical, Sao Paulo, Brazil.

Dr. Gunning has assisted or personally published over 20 publications. He resides with his wife and three children in the Pinehurst section of Baltimore.

Dr. Hardy as President

Cyril G. Hardy, MD took office as President of the Montgomery County Medical Society recently.

A native of England, Dr. Hardy is in the private practice of psychiatry in Silver Spring. He graduated from St. Bartholomew's Medical School at the University of London, and interned at White Memorial Hospital in Los Angeles. He did his residency in psychiatry at Eastern State Hospital in Virginia and Crownsville State Hospital in Maryland.

DR. HARDY

Dr. Hardy served on active duty in the US Navy Medical Corps. He became Chief of Staff at the Washington Adventist Hospital on Jan. 1, 1978, and is currently on the Active Staff there as well as Holy Cross, Montgomery General, Prince George's General and Leland Memorial Hospitals.

Other officers installed were John A. McCormack, MD as President-Elect; Howard I. Levine, MD as Vice President; Joseph Snyder, MD as Secretary and Henry M. Wise, Jr., MD as Treasurer.

Dr. Reichel Named President

Dr. William Reichel, Chairman of the Department of Family Practice at Franklin Square Hospital in Baltimore County, took office as President of the American Geriatrics Society at the 36th Annual Meeting of the Society on April 23, 1979 at the Mayflower Hotel in Washington, DC. □

The Low Iodine Thyroid Uptake: Normal T Dilemma

27

By DAVID J. SEFF, MD

Dr. Seff is Director of Nuclear Medicine of the Church Hospital Corporation, Baltimore 21231, where he can be contacted for reprint and other data.

Introduction

Exogenous iodine in food, drugs and radiographic contrast media is known to increase the circulating iodine pool and to spuriously reduce the I^{131} uptake to values in the range of hypothyroidism.

Acute thyroiditis is an acute inflammatory process with fever, elevated sedimentation rate, tender thyroid gland and extremely low I^{131} uptakes. In chronic thyroiditis, iodine trapping is usually normal, but the organification dysfunction frequently results in a low I^{131} 24-hour uptake. Thyroid antibodies, when present, are diagnostic.

It is, therefore, apparent that the low I^{131} uptake study alone cannot differentiate exogenous iodine interference from the various causes of hypothyroidism and thyroiditis. As will be discussed, a thyroid profile, with T_3 , T_4 , T_7 , TSH and response to TRH and TSH stimulation will ultimately clarify the etiology of the low I^{131} uptake.

•

The thyroid uptake of a standard dose of radioactive iodine is a physiological measure of thyroid function. In normal subjects, the feedback mechanism from the hypothalamus and anterior pituitary gland regulates I^{131} thyroid accumulation in response to circulating thyroid hormone and iodine pool homeostasis.

The clinical potential of the thyroid uptake in measuring thyroid function and thyroid gland affinity for radioactive iodine has been apparent since the pioneer work of Seidlin, Hertz and Ariel in 1940.¹⁻³ Under the influence of TSH, the thyroid gland traps and organifies iodine with tyrosine resulting in the synthesis and release of thyroxine into circulation.⁴⁻⁸

Subsequently, thyroxine (tetraiodothyronine) or T_4 bound to thyroid binding globulin (TBG) undergoes peripheral monodeiodination to its active metabolite 3, 3', 5, triiodothyronine (T_3) or to 3, 3', 5' triiodothyronine (reverse T_3 or rT_3) believed to be metabolically inactive.⁹⁻¹⁰

In response to decreased circulating thyroid hormone, thyroid releasing hormone (TRH) from the hypothalamus stimulates TSH production from the anterior pituitary gland. In a euthyroid state, the release of thyroxine into circulation will directly suppress TSH as well as the TSH response to TRH. Recent studies indicate that the thyroxine feedback does not suppress TRH secretion from the hypothalamus, but rather suppresses the TSH response to TRH. Paradoxically, there is even evidence that thyroxine may have a stimulatory effect on TRH secretion and consequently exhibiting both negative and positive feedback effects.¹¹

Overproduction of thyroxine in hyperthyroidism should suppress TSH release, while underproduction of thyroxine in primary hypothyroidism should increase TSH production.¹² TSH production may also directly be decreased in pituitary insufficiency (secondary hypothyroidism) as well as indirectly by TRH deficiency in hypothalamic disease (tertiary hypothyroidism). Hyperthyroidism results in elevated I^{131} uptakes while primary, secondary and tertiary hypothyroidism all result in low I^{131} uptakes. Exogenous iodine, as well as exogenous thyroid hormone, may spuriously lower the I^{131} uptakes. Exogenous iodine lowers the I^{131} uptake by increasing the circulating iodine blood pool. Exogenous thyroid hormone may spuriously lower the I^{131} thyroid uptakes by suppressing TSH from the anterior pituitary gland via the negative feedback mechanism. Although an elevated serum TSH is highly suspicious of primary hypo-

thyroidism, it should be noted that the TSH assay by radioimmunoassay is not reliable in the low ranges. The response of TSH to TRH may, however, be extremely beneficial in differentiating secondary from tertiary hypothyroidism. A poor serum TSH response following TRH stimulation is suggestive of pituitary insufficiency (second hypothyroidism). An exaggerated serum TSH response following TRH stimulation would be expected in both primary hypothyroidism and hypothalamic disease (tertiary hypothyroidism, Table 1).

Low I^{131} uptakes due to TSH suppression by thyroid replacement as well as low uptakes due to pituitary insufficiency should both respond to TSH stimulation. In cases of exogenous iodine, the serum TSH is usually normal and should not significantly change following TSH stimulation. Prolonged suppression of TSH by exogenous thyroid hormone may, however, transiently decrease the pituitary thyrotropin reserve for several weeks after withdrawal of thyroid hormone and result in persistent undetectable basal TSH concentrations with no significant response to TSH stimulation.¹³⁻¹⁸

Recent reports have indicated that the normal values of I^{131} thyroid uptake have been lowered by the abundance of exogenous iodine in food products, drugs and iodine containing contrast radiographic media.¹⁹⁻²³ It is therefore apparent that a low I^{131} uptake is a sensitive, but not a specific index of hypothyroidism. The T_3 and T_4 studies performed either by resin uptake or by radioimmunoassay have been recognized as reliable indices of circulating thyroid hormone. Both resin uptakes and radioimmunoassay methods rely on competitive binding principles and are available in most community hospitals.²⁴⁻³⁴ Although not significantly influenced by iodine, factors that increase TBG will decrease the T_3 resin uptake and increase the T_4 resin. Con-

versely, factors that decrease TBG will increase T₃ resin uptake and decrease T₄ by resin uptake.³⁵⁻³⁶ TBG is known to be increased by exogenous and endogenous estrogen production as well as by pregnancy and hepatitis.

TBG is conversely decreased by exogenous T₃, androgens, hypoalbuminemia, protein loss, chronic obstructive pulmonary disease, supraventricular cardiac arrhythmia and competitive binding interference by a variety of drugs (Prednisone, heparin, phenylbutazone, diphenylhydantoin, salicylates and penicillin).³⁶⁻³⁸ Although influenced by TBG, the serum T₃ and T₄ derived by radioimmunoassay procedures are true measurements of circulating T₃ and T₄ hormones.

Alteration in TBG production or competitive drug interference will result in inverse changes in the T₃ (Resin) and T₄ values derived by Resin or RIA. These discrepancies in TBG may be mathematically corrected by a factor called the T₇ (Abbott Laboratory). The T₇ (free thyroxine index) is derived by multiplying the T₃ (Resin) x T₄ (Resin or Radioimmunoassay) value and is recognized as an expression of circulating thyroxine.³⁹⁻⁴² Fortunately, exogenous

iodine does not significantly influence the T₃, T₄ or T₇ values. Therefore, in the absence of thyroiditis, a low I¹³¹ uptake but normal T₇ value, would suggest exogenous iodine interference as opposed to the low I¹³¹ uptake and low T₇ values of hypothyroidism. As has been mentioned, serum TSH values would be expected to be increased in the cases of primary hypothyroidism and normal by exogenous iodine. In acute thyroiditis, the I¹³¹ uptakes are characteristically very low with an unpredictable T₃, T₄ and T₇ and an elevated sedimentation rate. The I¹³¹ uptake as well as T₃, T₄ and T₇ are all unpredictable in chronic thyroiditis. The organification abnormality of chronic thyroiditis may be detected with the perchlorate washout maneuver. Thyroid antibodies, when present, are diagnostic of chronic thyroiditis. The T₃, T₄ and T₇ are low in hypothyroidism and elevated in hyperthyroidism.

It is, therefore, apparent that low I¹³¹ uptakes are not diagnostic of hypothyroidism and may also be the result of exogenous iodine, exogenous thyroid, or thyroiditis. We have no influence over the abundance of iodine in drugs and food products in our environment

that lower I¹³¹ uptakes. We also have no influence over the frequency of thyroiditis that may lower the I¹³¹ uptake and vary the T₃, T₄ and T₇. We can, however, influence the intelligent scheduling of thyroid iodine uptakes prior to iodine containing radiographic procedures to ultimately decrease the frequency of the low I¹³¹ normal T₇ dilemma.

Summary

In normal subjects, the radioactive iodine thyroid uptake is a reflection of the metabolic feedback homeostasis between hypothalamic (TRH) and anterior pituitary (TSH) centers responding to circulating iodine and thyroid hormone. Low I¹³¹ uptakes are not specific for hypothyroidism and may also be noted in thyroiditis as well as in TSH suppression by thyroid hormone replacement or with saturation of the iodine pool by exogenous iodine. A complete thyroid profile with T₃, T₄, T₇, TSH, thyroid antibodies as well as TRH and TSH stimulation studies are often essential in the differential diagnosis of the low I¹³¹ uptake.

The T₇ is derived by multiplying the T₃ (resin) and T₄ (resin or radioimmunoassay). This product is an acceptable expression of circulating thyroxine. Fortunately, iodine does not significantly alter the T₇ values. Therefore, in the absence of thyroiditis, a low thyroid uptake of radioactive iodine concomitantly with a normal T₇ is often the result of exogenous iodine interference.

Intelligent scheduling of thyroid uptake studies prior to performing radiographic procedures with iodine containing contrast media is imperative in avoiding "The Low Thyroid Uptake—Normal Thyroid Dilemma."

Classical Patterns of TSH Response After Thyronine *

* Thyronine - TRH (Abbott Laboratories) - Diagnostic Division - Scientific Affairs Dept.
Dr. Stephen Weiss - Abbott Laboratories.

George V. Eltgroth is a Patent Attorney for General Electric. He is legally blind.

George Eltgroth's official title is Counsel for Patent Strategy and Utilization. His work for the International Division of GE involves finding people who infringe on GE patents and handling cross licensing agreements between major corporations.

Eltgroth is 62. When he was 33, he contracted polio. It took him two years before he was able to walk with a cane. At 41 his vision dropped below the level of legal blindness. But, as Eltgroth points out, "There wasn't anyone who was going to look after me. I had four small children. I had to continue my career." In 1964, Eltgroth negotiated one quarter of GE's acquisition of Compagnie des Machines Bullé from Olivetti. He was put in

charge of patent operations in Phoenix, Milan, and Paris. "I had 20 French lawyers working for me," says Eltgroth, "only two of whom spoke English. So I learned French, not from books, but by ear." Eltgroth is also fluent in German and is able to work in Spanish as well.

"Handling forms is hard for me," says Eltgroth. "I have only peripheral vision about 1 or 2 percent of normal. I read slowly, so I have to do a lot of preparatory work for patent negotiations. My handwriting is weak, so I type. I have physical problems, but by developing my abilities in law and technology, I'm able to make the balance come out positive. I've wrapped up negotiations that would have taken most non-handicapped people five years

in two. When you're handicapped, you've got to test your limits. As a result of my polio, falling is dangerous—ice and snow are a problem. So I put screws in the bottom of my galoshes. When I had crutches, I put hooks on them for my briefcase. You shouldn't dwell on what's lost, but on what you have left."

PHYSICIAN PLACEMENT SERVICE

The Medical and Chirurgical Faculty of the State of Maryland maintains a Placement Service for the convenience of Maryland physicians, hospitals and communities in search of candidates for positions available in our state. A detailed description of such opportunities should be forwarded to the Physician Placement Service, 1211 Cathedral St., Baltimore, MD 21201; telephone 1-301-539-0872.

Physicians wishing to locate in Maryland are invited to submit a resume to be kept on file with the Physician Placement Service. Candidates are requested to inform the Faculty when they are no longer available for consideration for opportunities which might be available in Maryland.

Journal announcements on the Classified Advertising page for Physician Placement Service are charged at the regular Classified Advertising rate.

Case History

An eight-month-old black female presented to the emergency room with a three-week history of vomiting and decreased appetite. She had been seen three weeks prior to admission for similar symptoms. The patient was diagnosed as having viral gastroenteritis and a clear liquid diet was prescribed. Intermittent vomiting continued, resulting in two more visits to the emergency room. She had associated abdominal distention, decreased flatus, more frequent burping and vomiting after each feeding. Rectal temperature on admission was 101°F.

Vomiting was non-projectile, with no blood or bile. Bowel movements were decreasing in frequency, without gross blood or melena.

A plain abdominal film was obtained (Figure 1).

The abdominal radiograph (Figure 1) shows an abnormal gas pattern, with primarily small bowel loops. Some colonic gas is noted with a soft tissue mass in the mid-transverse colon outlined by intraluminal air.

What are the radiographic findings? Diagnosis? How would you manage this patient?

Answer on next page.

Discussion

Based on the clinical history and abdominal radiographic findings, a diagnosis of intussusception was made. This was confirmed by a barium enema (Figure 2). Partial reduction of an ileocolic intussusception was obtained; however, an irreducible ileocolic segment in the cecum was encountered (Figure 3), and the patient was taken to the surgical suite. At surgery, a portion of the terminal ileum was gangrenous, necessitating surgical removal of the gangrenous segment including the cecum with anastomosis of the remaining terminal ileum and ascending colon.

Intussusception is the most common cause of in-

FIGURE 3: Irreducible ileocolic segment in cecum.

testinal obstruction in infants and children between the ages of two months and five years,¹ with two-thirds occurring in patients below two years. Peak incidence occurs between the third and eleventh months of life. Sex incidence varies: Benson et al¹ reported a 2:1 male preponderance in their series of 300 cases, while Gierup et al² reported an absence of sex predominance in their series of 288 cases.

The etiology remains obscure in 85-90% of cases. Most authors regard the presence of prominent and/or hypertrophic lymphoid tissue in the terminal ileum of infants below one year of life as the primary mechanical factor in the production of intussusception. In addition, Margulis³ suggests that the change from a liquid to a solid diet, with subsequent increased peristaltic activity, may be an important, precipitating factor. In a small percentage of cases, an organic leading point may be found such as Meckel's diverticulum (the commonest local cause), cecal duplication, leiomyoma, intestinal polyp and lymphosarcoma.^{1-2, 4}

Some authors have reported a seasonal incidence,⁴ one peak occurring in the spring and another in the summer. The first peak corresponded with a high incidence of upper respiratory tract infections, pertussis, measles and German measles. The other peak corresponded with the peak incidence of various kinds of gastroenteritis. Other authors reported the absence of such seasonal incidence.¹

The classic triad of intermittent abdominal pain, vomiting and bloody stools is encountered in only 10-12% of cases. Either vomiting or abdominal pain is the most common presenting symptom according to different series (vomiting in 92% in the study by Freund et al and abdominal pain in 91% of cases in Gierup's study). Bloody stools occur from 16-56% and

FIGURE 2: Barium enema showing progressive reduction of ileocolic intussusception.

are more common in patients less than one year of age. Other symptoms include upper respiratory tract infections, high fever, diarrhea and constipation.² A palpable abdominal mass was found in 24-56% of patients.

Roentgen signs are variable. The definitive finding would be a visible abdominal mass on a plain film with verification by barium enema. The apex of the intussusception, the intussuscepiens, can be seen outlined by intraluminal air (as in our case) in only 15% of patients. Other signs include an abnormal gas pattern and intestinal obstruction. Often, the abdominal radiograph is normal, and if the clinical index of suspicion is high, a diagnostic barium enema should be performed.

The barium enema can be used primarily as a diagnostic tool,¹ with surgery the definitive corrective procedure, or it can be used as the primary therapeutic procedure for reduction, with hydrostatic pressure resulting in 81% success in Gierup's series. The enema bag is placed at 150 cm. above the table with one-three attempts at successful reduction. Success rates vary according to the number and severity of symptoms, duration of illness and kind of intussusception.² Freund et al reported successful reduction by enema in 47% of all patients, with 86% of this achieved in patients symptomatic for less than 24 hours. Gierup et al reported an overall success rate in 81-87%, with patients subjected to surgery only after failure of enema reduction. Benson's group preferred the use of the enema primarily as a diagnostic tool at their institution (Children's Hospital of Michigan). Recurrence rate following enema reduction was 6-10%; that following surgical reduction 3.9%.¹

Surgical procedures depend on surgical findings. Bowel resection was done for irreducible intussusception or the presence of gangrenous bowel or lead points such as Meckel's diverticulum. Manual reduction for edematous bowel may also be done at surgery.

Summary

In summary, intussusception is the most common cause of intestinal obstruction in infant and children, with a peak incidence between 3-11 months of life. Presenting symptoms are vomiting and abdominal pain and discomfort. Radiographic findings may include a visible mass, an abnormal gas pattern, intestinal obstruction or an essentially normal abdomen. Clinical suspicion of intussusception warrants a barium enema, either for diagnosis alone or for therapeutic reduction.

Doctors in the News

Dr. Maddrey Named Associate Physician-in-Chief

Willis C. Maddrey, MD, has been named Associate Physician-in-Chief of the Johns Hopkins Hospital and Associate Director of the Department of Medicine of the Johns Hopkins School of Medicine. Dr. Victor A. McKusick, Physician-in-Chief and Director of the Department of Medicine, announced recently that Dr. Maddrey would assume the newly-created positions.

Dr. Maddrey will be responsible for faculty and housestaff development in the Department of Medicine, the largest department at Hopkins, with a total of 400 full-time and part-time physicians and 85 housestaff members.

Since 1975, Dr. Maddrey has been Assistant Dean for Postdoctoral Education and Faculty Development at the Hopkins School of Medicine. In that position, he has developed teaching affiliations for Hopkins medical students and housestaff at surrounding hospitals.

An Associate Professor of Medicine, Dr. Maddrey will also continue to direct the Hopkins Liver Disease Program. His research in liver disease has recently centered on the treatment of acutely-ill patients with alcoholic hepatitis and the complications of cirrhosis.

DR. MADDREY

A Fellow of the American College of Physicians, Dr. Maddrey is an Associate Editor of *Medicine* and on the Board of Consulting Editors of the *American Journal of Medicine*. He is also on the gastroenterology board of the American Board of Internal Medicine, the governing board of the American Association for the Study of Liver Disease and the national board of directors of the American Liver Foundation.

A graduate of Wake Forest University, Dr. Maddrey received his Medical Degree at the Johns Hopkins School of Medicine, where he was named a member of the Alpha Omega Alpha Honorary Society. He completed his housestaff training at Hopkins, serving as Chief Resident on the Osler Medical Service from 1969-70.

He did postgraduate work on liver disease at Yale University and conducted research on liver disease in India with the US Public Health Service. □

Dr. Bormel Elected President

Paul Bormel, MD, a native of East Baltimore and a member of the St. Agnes Hospital medical staff, has been elected as President of the Board of Directors of the Baltimore City Medical Society Foundation, Inc.

The Foundation is the philanthropic arm of the BCMS and coordinates and distributes contributions donated on behalf of the Society and its members for useful, worthwhile endeavors.

Recent activities include presentation of several sizable scholarships to Baltimore residents who may be encountering financial difficulty during medical school training, with the hope that they will return to practice in the local community.

The Board members also include Ronald Fishbein, MD; Misbah Khan, MD; Anne McKusick, MD; Nathan Needle, MD; Roland Smoot, MD and Karl Weaver, MD. □

Tenuate® C
(diethylpropion hydrochloride NF)

Tenuate Dospan®
(diethylpropion hydrochloride NF) controlled-release

AVAILABLE ONLY ON PRESCRIPTION

Brief Summary

INDICATION: Tenuate and Tenuate Dospan are indicated in the management of exogenous obesity as a short-term adjunct (a few weeks) in a regimen of weight reduction based on caloric restriction. The limited usefulness of agents of this class should be measured against possible risk factors inherent in their use such as those described below.

CONTRAINDICATIONS: Advanced arteriosclerosis, hyperthyroidism, known hypersensitivity or idiosyncrasy to the sympathomimetic amines, glaucoma. Agitated states. Patients with a history of drug abuse. During or within 14 days following the administration of monoamine oxidase inhibitors, (hypertensive crises may result).

WARNINGS: If tolerance develops, the recommended dose should not be exceeded in an attempt to increase the effect; rather, the drug should be discontinued. Tenuate may impair the ability of the patient to engage in potentially hazardous activities such as operating machinery or driving a motor vehicle; the patient should therefore be cautioned accordingly. **Drug Dependence:** Tenuate has some chemical and pharmacologic similarities to the amphetamines and other related stimulant drugs that have been extensively abused. There have been reports of subjects becoming psychologically dependent on diethylpropion. The possibility of abuse should be kept in mind when evaluating the desirability of including a drug as part of a weight reduction program. Abuse of amphetamines and related drugs may be associated with varying degrees of psychological dependence and social dysfunction which, in the case of certain drugs, may be severe. There are reports of patients who have increased the dosage to many times that recommended. Abrupt cessation following prolonged high dosage administration results in extreme fatigue and mental depression; changes are also noted on the sleep EEG. Manifestations of chronic intoxication with anorectic drugs include severe dermatoses, marked insomnia, irritability, hyperactivity, and personality changes. The most severe manifestation of chronic intoxications is psychosis, often clinically indistinguishable from schizophrenia. **Use in Pregnancy:** Although rat and human reproductive studies have not indicated adverse effects, the use of Tenuate by women who are pregnant or may become pregnant requires that the potential benefits be weighed against the potential risks. **Use in Children:** Tenuate is not recommended for use in children under 12 years of age.

PRECAUTIONS: Caution is to be exercised in prescribing Tenuate for patients with hypertension or with symptomatic cardiovascular disease, including arrhythmias. Tenuate should not be administered to patients with severe hypertension. Insulin requirements in diabetes mellitus may be altered in association with the use of Tenuate and the concomitant dietary regimen. Tenuate may decrease the hypotensive effect of guanethidine. The least amount feasible should be prescribed or dispensed at one time in order to minimize the possibility of overdose. Reports suggest that Tenuate may increase convulsions in some epileptics. Therefore, epileptics receiving Tenuate should be carefully monitored. Titration of dose or discontinuance of Tenuate may be necessary.

ADVERSE REACTIONS: **Cardiovascular:** Palpitation, tachycardia, elevation of blood pressure, precordial pain, arrhythmia. One published report described T-wave changes in the ECG of a healthy young male after ingestion of diethylpropion hydrochloride. **Central Nervous System:** Overstimulation, nervousness, restlessness, dizziness, jitteriness, insomnia, anxiety, euphoria, depression, dysphoria, tremor, dyskinesia, mydriasis, drowsiness, malaise, headache, rarely psychotic episodes at recommended doses. In a few epileptics an increase in convulsive episodes has been reported. **Gastrointestinal:** Dryness of the mouth, unpleasant taste, nausea, vomiting, abdominal discomfort, diarrhea, constipation, other gastrointestinal disturbances. **Allergic:** Urticaria, rash, ecchymosis, erythema. **Endocrine:** Impotence, changes in libido, gynecomastia, menstrual upset. **Hematopoietic System:** Bone marrow depression, agranulocytosis, leukopenia. **Miscellaneous:** A variety of miscellaneous adverse reactions has been reported by physicians. These include complaints such as dyspnea, hair loss, muscle pain, dysuria, increased sweating, and polyuria.

DOSEAGE AND ADMINISTRATION: Tenuate (diethylpropion hydrochloride): One 25 mg. tablet three times daily, one hour before meals, and in mid-evening if desired to overcome night hunger. Tenuate Dospan (diethylpropion hydrochloride) controlled-release: One 75 mg. tablet daily, swallowed whole, in mid-morning. Tenuate is not recommended for use in children under 12 years of age.

OVERDOSAGE: Manifestations of acute overdose include restlessness, tremor, hyperreflexia, rapid respiration, confusion, assaultiveness, hallucinations, panic states. Fatigue and depression usually follow the central stimulation. Cardiovascular effects include arrhythmias, hypertension or hypotension and circulatory collapse. Gastrointestinal symptoms include nausea, vomiting, diarrhea, and abdominal cramps. Overdose of pharmacologically similar compounds has resulted in fatal poisoning, usually terminating in convulsions and coma. Management of acute Tenuate intoxication is largely symptomatic and includes lavage and sedation with a barbiturate. Experience with hemodialysis or peritoneal dialysis is inadequate to permit recommendation in this regard. Intravenous phenolamine (Regitine®) has been suggested on pharmacologic grounds for possible acute, severe hypertension, if this complicates Tenuate overdose.

Merrell

0-3001 (1976A)

**Whether overweight is a
complicating factor...
or just uncomplicated overweight.**

Tenuate[®] Dospan[®] ^{IV} **(diethylpropion hydrochloride NF)** **75 mg. controlled-release tablets**

A useful short-term adjunct in an indicated weight loss program.

Overweight patients in certain diagnostic categories often require strict obesity control. Diethylpropion hydrochloride has been reported useful in obese patients with hypertension, symptomatic cardiovascular disease, or diabetes. While it is not suggested that Tenuate in any way reduces these complications in the overweight, it may have a useful place as a short-term adjunct in a prescribed dietary regimen. (Tenuate should not be administered to patients with severe hypertension; see additional Warnings and Precautions on the opposite page.)

In uncomplicated obesity.

Many patients, on the other hand, present with excess fat but no disease. While this condition is often termed uncomplicated obesity, complications of both a social and a psychologic nature may be distressingly real for the patients. In these cases, a short-term regimen of Tenuate can help reinforce your dietary counsel during the important early weeks of an indicated weight loss program.

Clinical effectiveness.

The anorexic effectiveness of diethylpropion hydrochloride is well documented. No less than 16 separate double-blind, placebo-controlled studies attest to its usefulness in daily practice.¹ And the unique chemistry of Tenuate provides "...anorexic potency with minimal overt central nervous system or cardiovascular stimulation."² Compared with the amphetamines, diethylpropion has minimal potential for abuse.

**Tenuate—it makes sense.
And it's responsible medicine.**

Before prescribing, please consult complete product information, a summary of which follows:

The effectiveness of Valium (diazepam) in long-term use, that is, more than 4 months, has not been assessed by systematic clinical studies. The physician should periodically reassess the usefulness of the drug for the individual patient.

Contraindications: Tablets in children under 6 months of age, known hypersensitivity; acute narrow angle glaucoma; may be used in patients with open angle glaucoma who are receiving appropriate therapy.

Warnings: As with most CNS-acting drugs, caution against hazardous occupations requiring complete mental alertness (e.g., operating machinery, driving). Withdrawal symptoms (similar to those with barbiturates, alcohol) have occurred following abrupt discontinuance (convulsions, tremor, abdominal/muscle cramps, vomiting, sweating). Keep addiction-prone individuals (drug addicts or alcoholics) under careful surveillance because of predisposition to habituation/dependence.

Usage in Pregnancy: Use of minor tranquilizers during first trimester should almost always be avoided because of increased risk of congenital malformations, as suggested in several studies. Consider possibility of pregnancy when instituting therapy; advise patients to discuss therapy if they intend to or do become pregnant.

ORAL. Advise patients against simultaneous ingestion of alcohol and other CNS depressants.

Not of value in treatment of psychotic patients; should not be employed in lieu of appropriate treatment. When using oral form adjunctively in convulsive disorders, possibility of increase in frequency and/or severity of grand mal seizures may require increase in dosage of standard anticonvulsant medication, abrupt withdrawal in such cases may be associated with temporary increase in frequency and/or severity of seizures.

INJECTABLE. To reduce the possibility of venous thrombosis, phlebitis, local irritation, swelling, and, rarely, vascular impairment when used I.V.: inject slowly, taking at least one minute for each 5 mg (1 ml) given, do not use small veins, i.e., dorsum of hand or wrist; use extreme care to avoid intra-arterial administration or extravasation. Do not mix or dilute Valium with other solutions or drugs in syringe or infusion flask. If it is not feasible to administer Valium directly I.V., it may be injected slowly through the infusion tubing as close as possible to the vein insertion.

Administer with extreme care to elderly, very ill, those with limited pulmonary reserve because of possibility of apnea and/or cardiac arrest; concomitant use of barbiturates, alcohol or other CNS depressants increases depression with increased risk of apnea; have resuscitative facilities available. When used with narcotic analgesic eliminate or reduce narcotic dosage at least 1/3, administer in small increments. Should not be administered to patients in shock, coma, acute alcoholic intoxication with depression of vital signs.

Has precipitated tonic status epilepticus in patients treated for petit mal status or petit mal variant status.

Withdrawal symptoms (similar to those with barbiturates, alcohol) have occurred following abrupt discontinuance (convulsions, tremor, abdominal/muscle cramps, vomiting, sweating). Keep addiction-prone individuals under careful surveillance because of predisposition to habituation/dependence. Not recommended for OB use.

Efficacy/safety not established in neonates (age 30 days or less); prolonged CNS depression observed. In children, give slowly (up to 0.25 mg/kg over 3 minutes) to avoid apnea or prolonged somnolence; can be repeated after 15 to 30 minutes. If no relief after third administration, appropriate adjunctive therapy is recommended.

Precautions: If combined with other psychotropics or anticonvulsants, carefully consider individual pharmacologic effects—particularly with known compounds which may potentiate action of Valium (diazepam), i.e., phenothiazines, narcotics, barbiturates, MAO inhibitors and antidepressants. Protective measures indicated in highly anxious patients with accompanying depression who may have suicidal tendencies. Observe usual precautions in impaired hepatic function; avoid accumulation in patients with compromised kidney function. Limit oral dosage to smallest effective amount in elderly and debilitated to preclude ataxia or oversedation (initially 2 to 2½ mg once or twice daily, increasing gradually as needed or tolerated).

INJECTABLE. Although promptly controlled, seizures may return; readminister if necessary; not recommended for long-term maintenance therapy. Laryngospasm/increased cough reflex are possible during peroral endoscopic procedures, use topical anesthetic, have necessary countermeasures available. Hypotension or muscular weakness possible, particularly when used with narcotics, barbiturates or alcohol. Use lower doses (2 to 5 mg) for elderly/debilitated.

Adverse Reactions: Side effects most commonly reported were drowsiness, fatigue, ataxia. Infrequently encountered were confusion, constipation, depression, diplopia, dysarthria, headache, hypotension, incontinence, jaundice, changes in libido, nausea, changes in salivation, skin rash, slurred speech, tremor, urinary retention, vertigo, blurred vision. Paradoxical reactions such as acute hyperexcited states, anxiety, hallucinations, increased muscle spasticity, insomnia, rage, sleep disturbances and stimulation have been reported, should these occur, discontinue drug.

Because of isolated reports of neutropenia and jaundice, periodic blood counts, liver function tests advisable during long-term therapy. Minor changes in EEG patterns, usually low-voltage fast activity, have been observed in patients during and after Valium (diazepam) therapy and are of no known significance.

INJECTABLE. Venous thrombosis/phlebitis at injection site, hypoactivity, syncope, bradycardia, cardiovascular collapse, nystagmus, urticaria, hiccups, neutropenia.

In peroral endoscopic procedures, coughing, depressed respiration, dyspnea, hyperventilation, laryngospasm/pain in throat or chest have been reported.

Management of Overdosage: Manifestations include somnolence, confusion, coma, diminished reflexes. Monitor respiration, pulse, blood pressure; employ general supportive measures, I.V. fluids, adequate airway. Use levetterenol or metaraminol for hypotension, caffeine and sodium benzoate for CNS-depressive effects. Dialysis is of limited value.

Supplied: Tablets, 2 mg, 5 mg and 10 mg, bottles of 100 and 500, Tel-E-Dose® (unit dose) packages of 100, available in trays of 4 reverse-numbered boxes of 25, and in boxes containing 10 strips of 10, Prescription Paks of 50, available singly and in trays of 10. Ampuls, 2 ml, boxes of 10, Vials, 10 ml, boxes of 1, Tel-E-Ject® (disposable syringes), 2 ml, boxes of 10. Each ml contains 5 mg diazepam, compounded with 40% propylene glycol, 10% ethyl alcohol, 5% sodium benzoate and benzoic acid as buffers, and 1.5% benzyl alcohol as preservative.

MEDICAL HYPNOSIS VERSUS HYPNOTISM:
WHAT THEY ARE - AND WHAT THEY ARE NOT

An Exclusive Interview With Edward O. Hunt, Jr., MD

... page 35

A full range of treatment...

As an Air Force physician, you may practice your specialty in modern, well-equipped facilities with a complete support staff.

In addition to the wide spectrum of clinical experience you'll gain, you'll have administrative support to alleviate most of the clerical workload. The type of medicine you will practice is based on the needs of your patients, regardless of their financial status.

For yourself and your family, Air Force medicine will provide reasonable working hours, excellent pay, 30 days of paid vacation each year, and many other benefits.

Consider the Air Force Medical Corps – a reasonable alternative for today's physicians.

CALL COLLECT
Air Force. A great way of life.

There are a lot of good reasons to "Buy American" that aren't emotional.

In purchasing a car, "Buy American" is a good idea. For a lot of reasons. Some are completely personal, matters of individual choice. That's the emotional side of the question. But, let's look at the practical side...where the facts are.

First, price. While it's true that American new-car prices have risen along with everything else, prices on foreign cars have literally sky-rocketed. And, figures around \$25,000 are not at all uncommon.

But, initial cost is only the beginning. Consider parts. Front shock absorbers for a 1979 Cadillac Seville cost \$15.97 each. The same part on a new Mercedes 280 SE is \$55.50. Unfortunately, the higher price doesn't guarantee availability. That's something else. Air filters? \$9.82 on Seville. \$21.00 on Mercedes. And the list goes on.

Another thing. If you ever need emergency service, which

car do you think the average station mechanic is more familiar with? Put your money on the Cadillac. And, if that's what you're considering, you'll find a fine selection of new and used Cadillacs at Chesapeake. Like that '79 Seville we mentioned earlier. Here's the first American car to combine international size, styling and performance with Cadillac comfort and convenience. Chosen as one of the twenty-five best designed of all products in America.

Or, the new breed of Eldorado, with front-wheel drive, electronic fuel injection, front-wheel independent suspension, electronic level control, front-wheel disc brakes and side window defoggers — a combination of features found on no other car as standard equipment.

And, here's something else that's standard. Not on all Cadillacs, but on every Cadillac from Chesapeake. Chesapeake Priority Service. Because we believe when you own a luxury car, you ought to be treated like a luxury car owner. We have the parts, and we've been selling and servicing American cars for over half a century.

Now, we have nothing against Mercedes or BMW or any other luxury car from Europe. They're fine automobiles. But the fact is that Seville and Eldorado from Cadillac are better buys.

And a 1979 Seville or Eldorado from Chesapeake is the best luxury car buy anywhere.

Two more facts. More Americans choose to own Seville than any luxury import. There has to be a reason. And, more Cadillac buyers buy from Chesapeake than any other dealer, in town or out. For a lot of reasons. Even emotion.

Chesapeake Cadillac

Competitive prices with service that has no competition. 2401 North Charles Street, (301) 366-9000

A character all its own.

Valium (diazepam/Roche) is a benzodiazepine with a character all its own.

Pharmacologically, it is a potent skeletal muscle relaxant and anticonvulsant (in adjunctive use), as well as an antianxiety agent. Pharmacokinetically, only Valium provides active *diazepam* as well as the active metabolites 3-hydroxydiazepam, desmethyldiazepam and oxazepam.

But the individual character of Valium is even more apparent clinically than pharmacokinetically. And far more significant. That's because of the patient response obtained with Valium. A response which brings a calmer frame of mind. A response which has a pronounced effect on the somatic symptoms of anxiety, particularly muscular tension. A response which helps the patient feel more like himself again because of the way Valium reduces the overwhelming symptoms of anxiety and psychic tension.

Another important aspect of the clinical character of Valium is safety. Though drowsiness, ataxia and fatigue are possible, these and more serious side effects are rarely a problem. Of course, as with all CNS-acting drugs, patients taking Valium should be cautioned against driving, operating dangerous machinery or the simultaneous ingestion of alcohol.

Unquestionably, many psychotherapeutic agents, including other benzodiazepines, have antianxiety effects. But one fact remains: you get a certain kind of patient response with Valium. It's a response you want. A response you know. A response you trust as part of your overall management of anxiety and psychic tension.

Valium[®] IV
diazepam/Roche
2-mg, 5-mg, 10-mg scored tablets
**a prudent choice in psychic
tension and anxiety**

Before prescribing, please consult complete product information, a summary of which follows:

Indications: Tension and anxiety states; somatic complaints which are concomitants of emotional factors; psychoneurotic states manifested by tension, anxiety, apprehension, fatigue, depressive symptoms or agitation; symptomatic relief of acute agitation, tremor, delirium tremens and hallucinosis due to acute alcohol withdrawal; adjunctively in skeletal muscle spasm due to reflex spasm to local pathology; spasticity caused by upper motor neuron disorders; athetosis; stiff-man syndrome; convulsive disorders (not for sole therapy).

The effectiveness of Valium (diazepam/Roche) in long-term use, that is, more than 4 months, has not been assessed by systematic clinical studies. The physician should periodically reassess the usefulness of the drug for the individual patient.

Contraindicated: Known hypersensitivity to the drug. Children under 6 months of age. Acute narrow angle glaucoma; may be used in patients with open angle glaucoma who are receiving appropriate therapy.

Warnings: Not of value in psychotic patients. Caution against hazardous occupations requiring complete mental alertness. When used adjunctively in convulsive disorders, possibility of increase in frequency and/or severity of grand mal seizures may require increased dosage of standard anticonvulsant medication; abrupt withdrawal may be associated with temporary increase in frequency and/or severity of seizures. Advise against simultaneous ingestion of alcohol and other CNS depressants. Withdrawal symptoms (similar to those with barbiturates and alcohol) have occurred following abrupt discontinuance (convulsions, tremor, abdominal and muscle cramps, vomiting and sweating). Keep addiction-prone individuals under careful surveillance because of their predisposition to habituation and dependence.

Usage in Pregnancy: Use of minor tranquilizers during first trimester should almost always be avoided because of increased risk of congenital malformations as suggested in several studies. Consider possibility of pregnancy when instituting therapy; advise patients to discuss therapy if they intend to or do become pregnant.

Precautions: If combined with other psychotropics or anticonvulsants, consider carefully pharmacology of agents employed; drugs such as phenothiazines, narcotics, barbiturates, MAO inhibitors and other antidepressants may potentiate its action. Usual precautions indicated in patients severely depressed, or with latent depression, or with suicidal tendencies. Observe usual precautions in impaired renal or hepatic function. Limit dosage to smallest effective amount in elderly and debilitated to preclude ataxia or oversedation.

Side Effects: Drowsiness, confusion, diplopia, hypotension, changes in libido, nausea, fatigue, depression, dysarthria, jaundice, skin rash, ataxia, constipation, headache, incontinence, changes in salivation, slurred speech, tremor, vertigo, urinary retention, blurred vision. Paradoxical reactions such as acute hyperexcited states, anxiety, hallucinations, increased muscle spasticity, insomnia, rage, sleep disturbances, stimulation have been reported; should these occur, discontinue drug. Isolated reports of neutropenia, jaundice; periodic blood counts and liver function tests advisable during long-term therapy.

Dosage: Individualize for maximum beneficial effect. *Adults:* Tension, anxiety and psychoneurotic states, 2 to 10 mg b.i.d. to q.i.d.; alcoholism, 10 mg t.i.d. or q.i.d. in first 24 hours, then 5 mg t.i.d. or q.i.d. as needed; adjunctively in skeletal muscle spasm, 2 to 10 mg t.i.d. or q.i.d.; adjunctively in convulsive disorders, 2 to 10 mg b.i.d. to q.i.d. *Geriatric or debilitated patients:* 2 to 2½ mg, 1 or 2 times daily initially, increasing as needed and tolerated. (See Precautions.) *Children:* 1 to 2½ mg t.i.d. or q.i.d. initially, increasing as needed and tolerated (not for use under 6 months).

Supplied: Valium[®] (diazepam) Tablets, 2 mg, 5 mg and 10 mg—bottles of 100 and 500; Tel-E-Dose[®] packages of 100, available in trays of 4 reverse-numbered boxes of 25, and in boxes containing 10 strips of 10; Prescription Paks of 50, available singly and in trays of 10.

AN EXTENSION OF HOPE FOR THE ALCOHOLIC

HIDDEN BROOK BEL AIR

Established 1968

We are pleased to announce the opening of Hidden Brook at Warwick. This is a major new enlargement of our capacity for the treatment of alcoholics...an expansion of 20 additional beds to the 39 already at Bel Air. Beautifully situated on the waterfront of the Warwick River near Secretary, Maryland in Dorchester County...the total environment is peaceful and ideally conducive to rehabilitation. The program, philosophy and rates of Hidden Brook at Warwick will be identical and interchangeable in every respect with the program at Hidden Brook, Bel Air. Request our brochure. Write or phone for information.

Now, in addition HIDDEN BROOK at WARWICK

Your Medical Faculty At Work

JOHN SARGEANT, CAE, Executive Director

Council

The Council met on May 2, 1979, just prior to the annual session of the House of Delegates. The meeting was held at Hunt Valley Inn, Hunt Valley, MD.

The Council took the following actions:

1. Heard from representatives of the Maryland High Blood Pressure Commission and understood from these persons that it was not the intention of the Commission to endorse a pharmacist to "evaluate, diagnose and treat where there is both a patient need and available and qualified pharmacy personnel."

Determined that a communication be directed along these lines to the appropriate persons, and also request a correction be carried in the next issue of the **Maryland High Blood Pressure Council News**.

2. Recommended, on component society requests, the granting of Emeritus Membership to certain physicians.

3. Requested the **Journal** Editorial Board to publish an obituary on I. Ridgeway Trimble, MD of Baltimore.

4. Waived 1979 dues at the request of a component for a physician who is ill.

5. Increased mileage allowance for automobile travel for Faculty officers, staff and committee members when travelling on Faculty business to \$.20 per mile effective June 1, 1979.

The Council met on May 5, 1979, immediately following adjournment of the House of Delegates and took the following actions:

1. Elected Albert M. Antlitz, MD, Baltimore, as Council Chairman.

2. Elected J. Roy Guyther, MD, Mechanicsville, as Council Vice Chairman.

House of Delegates

The House of Delegates met on May 2, 1979, at Hunt Valley Inn, Hunt Valley, MD and took the following actions:

1. Heard from Charles Buck, DSc, newly-appointed Secretary of the Department of Health and Mental Hygiene.

2. Heard an annual report from the President which will be printed in full in the Annual Report issue of the **Journal** in August, 1979.

3. Heard from Daniel Cloud, MD, of Phoenix, AZ, who is Secretary-Treasurer of the AMA and a member of the Board of Trustees.

4. Heard from visiting State Society Presidents.

5. Observed a moment's silence for deceased members.

6. Adopted several Memorial Resolutions of former members.

7. Presented 50-Year Certificates and Pins to those members earning this accolade.

8. Granted Emeritus Membership to physicians who had received the recommendation of their Component Society and the Council.

9. Adopted several bylaw amendments.

10. Instructed the Bylaws Committee to develop another bylaw amendment regarding the Legislative Committee.

11. Received the Nominating Committee report.

The House met in its second session on May 5, 1979, again at Hunt Valley Inn, Hunt Valley, MD, and took the following actions:

1. Heard the election of Board of Medical Examiners members who were elected at the General Meeting on May 3, 1979.

2. By unanimous consent, dispensed with the ballot and elected all nominees submitted to the House on May 2, 1979.

3. Heard reports from Richard F. Moschell, MD, Chairman of the Maryland Medical Political Action Committee, and from Mrs. Kassie Herbert, Auxiliary President. Both reports will be contained in the annual report issue of the **Journal** in August, 1979.

4. Adopted a resolution dealing with the disease of alcoholism and urged various groups to contain basic insurance benefits for this disease in their health insurance policies. □

DR. ANTLITZ, New Council Chairman.

The Open Forum

"One-Sided Exposition . . ."

To the Editor:

I was distressed to receive my April, 1979 issue of the *Journal* because of the one-sided exposition of the advantages of belonging to the AMA. (Ed. note: **Should Med-Chi Members Also Be AMA Members? Interviews With Drs. Russell Fisher, Charles O'Donnell and Stephen Padussis to Help You Decide - - - BT.**)

The title page, in fact the frontispiece, of the *Journal* says Should Med-Chi members also be AMA members? but, in fact, on the inside there are three articles all unreservedly in favor of such action. It's not clear from the introduction to these three obviously-slanted pieces as to whether or not opponents belonging to the AMA were ever consulted as to the opportunity of rebuttal. Since when is an issue resolved without having two opposing sides state their cases?

Although this letter is meant only as a complaint about the lack of opposition views being printed in the *Journal*, I would have to point out that there are several issues raised by the three distinguished physician of the Faculty which require addressing. Number one, the implication is clearly stated, especially in Dr. Fisher's comments, that the only opposition to AMA membership comes from left-wing, radical, academic, university-based physicians. This is just absolutely not true. Furthermore, there is an element of *argumentum ad hominem* in Dr. Fisher's article about physicians with academic appointments that vitiates his argument.

The second point I'd like to make is the very fact that the youngest member in the Faculty to be an AMA Delegate of the three is 56 years old is exactly one of the reasons that the younger physicians do not want to join. Someone who has perhaps five or 10 years remaining of productive practice can hardly be considered representative of the younger physician, and I'm not speaking of the house officer now, I'm speaking of the physician in the age-range from 35-45.

It is not my intention to write a rebuttal to these distinguished physicians, as my opposition to membership in the AMA is well-known, but I do think that when an issue like this is to be aired in our *Journal*, that both sides should have opportunity to state their cases.

Thank you again for your consideration.

PARK W. ESPENSHADE, JR., MD

The Physician Assistant

To the Editor:

Physician Extenders were originated some 15 years ago at Duke University in North Carolina. The intention was to provide professionals to help fill the gap in the envisioned physician shortage. These new health workers were trained to extend the capabilities of the physician by performing many of the duties that were traditionally "physician-only."

Many of the original Physician Extenders were accepted to the field by virtue of past experience: the grandfather clause. Now, due to the increasing demand to possess more sophisticated medical knowledge, Physician Extenders must graduate from an American Medical Association-approved Physician Assistant Program. After completion of training, they must sit for a national certifying examination.

As the role of the Physician Extender has evolved, a myriad of titles for the profession has emerged. Some of the names these individuals will answer to include "Physician Assistant," "Physician Associate," "Health Associate," "Clinical Associate," "Medex" and "Health Practitioner." The American Academy of Physician Assistants, however, encourages the use of the term "Physician Assistant."

All this may appear, at first, to be an exercise in semantics. I feel, though, the decision to adopt the title, "Physician Assistant" (PA) by our professional academy should speak of the light in which the PA sees himself. PAs are trained individuals who desire to work with a physician to obtain the goal of quality health care. As the title implies, the PA is an assistant to the doctor. He is not out to replace the doctor, nor does he have the ability. It is true that the Physician Assistant can perform many of the functions that were traditionally the physician's role. Often times these functions can be accomplished with more expertise by the PA. The Physician Assistant can, in a variety of settings, make independent decisions and implement therapy. The PA, however, is limited in his scope of knowledge and abilities. Any Physician Assistant who does not recognize this is only disillusioning himself. This should not, however, mean that PAs are "second-rate" practitioners. PAs are good at what they do. All they need is a chance.

PAs do not want independent practice. They want and need the supervision of the physician. This supervision, however, may come in many forms. For some clinical settings, the Physician Assistant needs direct supervision. An example of this would be the case of a PA first assisting in surgery. Other settings would lend themselves to more relaxed supervision. A PA following a group of hypertensives could function with protocols, frequent chart reviews and consultations as required. The Maryland State Board of Medical Examiners at this time tends to be conservative in its definition of supervision. The practicing community of PAs asks for the opportunity to prove themselves and help the physician provide quality health care in an unencumbered way.

The National Certifying Examination for Physician

Assistants provides a standard by which to measure PAs' acumen. This tool should be used to assure the quality of practicing PAs. Prospective employers of Physician Assistants should demand certification, and the Board of Medical Examiners should likewise require certification for registration.

The Physician Assistant sees himself as a valuable member of the medical team. We want the chance to work with the physician in an ever-expanding role to provide service to the patients.

Hopkins Allergists Hope to Determine Which Children Endangered by Insect Stings

Will a child who has suffered from hives, swelling of the face, hands and feet or all-over itchiness after being stung by an insect have a more serious or even life-threatening allergic reaction if stung again?

Most doctors and parents fear the answer is yes, and many shelter such children from outdoor activity, but Johns Hopkins allergists at Good Samaritan Hospital in Baltimore believe the question is far from answered and plan a large-scale study to determine which children are endangered by future insect stings and which will lose their sensitivity to stings over time.

The allergy team is looking for youngsters between 3-16 years of age who have experienced allergic reactions to insect stings to participate in the study. Children will receive a free evaluation of their sting sensitivity to determine whether and to which insect they might react if stung again. Free treatment with an effective new therapy developed by Hopkins allergists will be offered to certain participants in the study, alongwith follow-up examinations and consultations with the participants' physicians.

Parents and doctors who would like to refer a child to the study should call the Allergic Disease Center at (301) 323-2200, ex. 394.

The study is prompted by the expectation that a highly-effective, new treatment for insect sting allergies developed by Hopkins allergists will soon become commercially-available. The treatment, a series of injections of gradually-increasing amounts of pure insect venom, has prevented subsequent allergic reactions to stings in 95% of children and adults treated so far.

Though effective, the treatment will be expensive and may need to be continued for many years, perhaps for life.

These considerations raise questions about who should get the treatment. Scientists still don't know whether a person who had an allergic reaction in the past will have a worse, similar or milder reaction if stung again. Many children lose their sensitivity to stings over time, and some get more severe reactions with each sting. Those children who would lose their sensitivity quickly might not need venom therapy.

"We hope to determine who can benefit from the new insect therapy and avoid unnecessary and long-term treatment for others," says Kenneth C. Schuberth, MD, Coordinator of the study.

There are three types of reactions to insect stings, according to Dr. Schuberth: "Most people, when stung by a yellow jacket, honeybee, hornet or wasp, will have a 'normal' reaction consisting of pain and swelling at the site of the sting, lasting less than 24 hours," he says. "A small number of people will have a 'non-life-threatening generalized reaction' to the sting. They may itch all over, break out in hives and swell on the face and the extremities. Most serious is the 'life-threatening generalized reaction,' which is accompanied by difficulty in breathing, a drop in blood pressure, unconsciousness and, rarely, death."

May Meeting

Sufficiently-removed from the Med-Chi Meeting to provide some perspective, the May BCMS meeting only briefly reviewed the actions taken there. President Antlitz reported that the Bylaws amendments were approved as printed in the *NEWS-LETTER*.

President Antlitz, for the first time, presented Membership Certificates to all newly-elected members present to receive them: Drs. Butta, Garcia, Kaminsky, Scott and Knauer. Any other members who would like a Certificate of Membership should inform the Society Office and one will be prepared for them.

Edmund Beacham, MD, Chairman of Tellers, announced the results of our run-off election. William G. Helfrich, MD, is our third, newly-elected Representative on the Med-Chi Council.

Dr. Heldrich Speaks

Fred Heldrich, MD, Chairman of the Professional Education Committee and also Chairman of the Department of Pediatrics at St. Agnes Hospital in Baltimore, assumed the gavel for the scientific portion of the Meeting. He doubled in brass by starting right in to present the evening's topic: *Educators and Physicians: Partners in Child Health*. The physician's responsibility to the partnership, he said, is three-fold: to *evaluate* the child to *treat* any treatable conditions and to *monitor* the results of treatment. This is a continuing, progressive responsibility through all the school years. Three periods emerge where change is most likely to happen and medical alertness is most needed. First, is on entrance to the school program when everything is new to the child and the child, in turn, is most malleable.

Second, is at the third to fourth grades where reading begins and understanding the printed word is so important. Third, is in about the seventh grade when adolescence insidiously begins to take hold.

Dr. Crew Talks

A splendid slide show and commentary on the Baltimore school system introduced Dr. John L. Crew, Sr., Superintendent of Public Instruction in the Baltimore City Public Schools. Noting that truancy had plagued Baltimore schools in the preceding decades to the extent that 25-30% of the students might be absent on any one day, he described plans made to combat truancy. Special schools were made the major thrust in regeneration of the school system. Dr. Crew interpreted many graphs and provided some more current statistics. He discussed questions of discipline and possible language curriculum, i.e., Latin. Most of the system's present problems, he declared, stem from financial causes. It boils down to the balance of salary versus staffing. The educator's contribution to the partnership should be along four thrusts, also: Health Considerations Planning, Health Education, Health Services to students and Health Staffing improvements and availability of consultation to the Health Staff when needed.

Directors Meet

The Directors had a long agenda when they met May 15th, starting with consideration of the resignation of two members of the recently-formed Mayor's Medical Advisory Committee to the Fire Department. The discussion centered around appropriate specialty representation, particularly alcoholism. New designees will be intended to broaden the interests represented by the members chosen.

The 10 major causes of death in Baltimore were the subject of the Public Education Committee's communication from Earlie

H. Francis, MD, its Chairman. It's recommended that the BCMS initiate some effort to make the public more aware of them and what can be done about their prevention, possibly some presentation through investigative reporting and cooperation of one or more physicians recognized as an expert on one or more of the causes.

Also suggested was revival of the *Day with a Doctor* project of a few years back. This would be an educational program for high school students considering careers in the health fields. Development of both projects was authorized.

The Public Relations Committee will be supported in two outreach efforts, a June, 1979 participation in the American Indian Study Center's Health Fair in Fell's Point and a September, 1979 exhibit in the Baltimore City Fair. The City Fair will center on the twin topics of *Cost Containment of Medical Services* and *Alcoholism*. The American Council on Alcoholism, with the State and City Police Departments, will participate. There will be exhibit panels and breathalyzer tests. An estimate for an exhibit on *Cost Containment* from the Hopkins Medical Art Department will be sought.

The Directors also approved in principle support for a November, 1979 Physical Fitness Fair for Women proposed by the Public Health Committee, Vincent Fitzpatrick, MD, Chairman. Other sponsors would be the Mayor's Office, the Health Department and the American College of Ob-Gyn.

Dr. Yaffe's Talk

Among proposals from the Finance Committee, Kennard L. Yaffe, MD, Chairman, is a review of our Society's election process. It is the more costly because of the tear-off envelope used to ensure the privacy of the vote. The Bylaws Committee was directed to investigate less expensive secret ballot methods.

Elliott R. Fischel, MD, Chairman of the Peer Review Committee, reports problems with the Blue Shield Profile system. From experience with physicians brought before it who are in conflict with the system, the Committee deems the Profile System to be inflationary, grossly unfair and susceptible to gross abuses. This problem was referred to the Committee on Third-Party Carriers for consideration and possible resolution. □

Discipline Commission Action

Editor's Note: On instruction of the Council of the Medical and Chirurgical Faculty of the State of Maryland, "Findings of Fact, Conclusions of Law and Order" will be published in the JOURNAL.

IN THE MATTER OF EMMETT DAVIS, MD, BEFORE THE
COMMISSION ON MEDICAL DISCIPLINE OF MARYLAND

Findings of Fact, Conclusions of Law and Order

By letter dated June 7, 1978, John E. Adams, MD, Chairman of the Commission on Medical Discipline of Maryland, advised Emmett Davis, MD (the "Respondent") through his attorney, Alfred L. Scanlan, Jr., that a hearing would be held on June 20, 1978 to consider whether the Respondent had violated certain conditions set forth in the Commission's Feb. 21, 1978 Order upon which he was placed on probation and the revocation of his medical license stayed. The conditions in question are as follows:

"3. That the Respondent undertake a minimum of five hours per week of Continuing Medical Education as approved by the Commission.

4. That the Respondent undertake a preceptorship program at his expense, such program to consist of at least eight hours per week with the preceptor and the plan of preceptorship to be approved by the Commission.

6. That the Respondent shall submit to continuing quarterly review of his practice by the Peer Review Committee of the Medical and Chirurgical Faculty of Maryland.

7. That the Respondent shall have the preceptor and the Peer Review Committee submit quarterly reports evaluating the Respondent's improvement. Should such quarterly reports indicate that the Respondent's medical skills are not improving, the Commission may, at its option, conduct a hearing to consider the withdrawal of the Stay based on Respondent's failure to improve his medical skills."

The hearing was convened at 4 PM before John E. Adams, MD; John G. Ball, MD; Jerome J. Collier, MD; Eli M. Lippman, MD; Karl F. Mech, MD; William A. Pillsbury, MD and Frank M. Shipley, MD, constituting a quorum of the Commission. The Respondent appeared with his attorney, Alfred L. Scanlan, Jr. Stephen J. Sfekas, Assistant Attorney General, presented the case on behalf of the Commission. Jack C. Tranter, Assistant Attorney General, advised the Commission on rules of evidence. The hearing commenced with Mr. Sfekas presenting a Stipulation of Facts agreed to by both parties. He then rested the Commission's case. Mr. Scanlan then called the Respondent to testify on his own behalf. The following documentary evidence was also produced:

Respondent's Exhibit #1—Letter dated Apr. 7, 1978, from Joseph I. Berman, MD, Chairman, Peer Review Committee, Medical and Chirurgical Faculty, to Emmett P. Davis, MD.

Respondent's Exhibit #2—Copy of a letter dated Apr. 14, 1978, from Alfred L. Scanlan, Jr., Esq. to Jack C. Tranter, Esq.

Respondent's Exhibit #3—Copy of a letter dated May 1, 1978, from Alfred L. Scanlan, Jr., Esq. to Joseph I. Berman, MD.

Respondent's Exhibit #4—Copy of a letter dated June 12, 1978, from Alfred Scanlan, Jr., Esq. to Jack C. Tranter, Esq.

Respondent's Exhibit #5—Copy of a letter dated Apr. 24, 1978 from John E. Adams, MD to Edward J. Kowalewski, MD with writing in pen at the bottom.

Following closing arguments, the hearing was concluded.

Further information was submitted to the Commission by Mr. Scanlan in letters dated June 22, 1978 and July 13, 1978.

Findings of Fact

Based on the testimony and documentary evidence produced, the Commission made the following findings of fact:

1. That on Feb. 21, 1978, the Consent Order between the Respondent and the Commission was finalized. A copy of the Commission's Feb. 21, 1978 Order is attached hereto and made a part hereof.

2. That on Apr. 1, 1978, the Respondent left the private practice of medicine and began employment with the US Army as a civilian physician.

3. That the Respondent's medical services for the Army presently are performed at the Edgewood Arsenal.

4. That the Respondent is the only physician at Edgewood Arsenal and his duties include:

a) Implementation of OSHA requirements;

b) Dispensing drugs;

c) Responsibility for sick-call for military personnel during which individuals are seen by non-physician military medical personnel, with the Respondent acting as their supervisor;

d) Responsibility for work-related injuries sustained by civilian employees at Edgewood Arsenal;

e) Responsibility for examining persons previously injured to determine whether they are well enough to return to work.

5. That the Commission did not receive formal notice of the Apr. 1, 1978 change in Respondent's employment and practice status until the receipt of a letter on June 12, 1978 from the Respondent's attorney to Jack C. Tranter, Assistant Attorney General, the Commission's attorney.

6. That on Apr. 7, 1978, Joseph I. Berman, MD, Chairman, Peer Review Committee of the Medical and Chirurgical Faculty, asked the Respondent for the name of his preceptor and sought to schedule the quarterly review of the Respondent's practice mandated by the Commission's Feb. 21, 1978 Order.

7. That by letter dated Apr. 14, 1978 from Alfred L. Scanlan, Jr., the Respondent's attorney, to Jack C. Tranter, Assistant Attorney General, Mr. Scanlan asked certain general questions regarding whether a change in the nature of Respondent's practice including a cessation of private practice would have an impact on the terms of the Commission's Feb. 21, 1978 Order.

8. That by letter dated Apr. 24, 1978, from John E. Adams, MD, Chairman of the Commission, to Edward J. Kowalewski, MD, with a copy to the Respondent, Dr. Kowalewski and the Respondent were advised that the preceptorship established for the Respondent at the Family Practice Program of the University of Maryland School of Medicine had been approved by the Commission.

9. That subsequent to his receipt of the Commission's Apr. 24, 1978 letter, the Respondent advised Dr. Muncy of the Family Practice Program of the University of Maryland School of Medicine that he had decided not to participate in this preceptorship program and that he was going to "pursue other options."

10. That by letter dated May 1, 1978, Mr. Scanlan asked Dr. Berman to confer with the Commission and Mr. Tranter regarding a substantial alteration of the Respondent's probation and preceptorship.

11. That by letter dated June 7, 1978, the Respondent, through his attorney, was advised of a hearing scheduled for June 20, 1978 to consider whether the Respondent had violated the Conditions of his Probation.

12. That the Respondent's preceptorship was established and was approved by the Commission on or about Apr. 24, 1978, but the Respondent unilaterally chose not to participate in that program.

13. That since Feb. 21, 1978, to the present, the Commission has not received any request from the Respondent for approval of Continuing Medical Education courses or programs he desired to take.

14. That pursuant to the Stipulation of Facts, the Respondent during the 10-week period prior to the date of the hearing, obtained 55 hours of training.

15. That all 55 hours of training were part of Respondent's orientation for his new position.

16. That none of the courses which comprised the 55 hours of training was submitted to the Commission for approval as is required by Condition #3 of the Feb. 21, 1978 Order.

17. That though none of the 55 hours of training was submitted to the Commission for approval, had it been submitted,

little of this training would have been approved as continuing medical education since Respondent continues to practice general medicine and none of this training was in that field.

18. That pursuant to Condition #3 of the Feb. 21, 1978 Order, the Respondent should have obtained 85 hours (17 weeks x 5 hours/week) of Commission-approved continuing medical education.

19. That Respondent failed to obtain any continuing medical education approved by the Commission as is required by the Feb. 21, 1978 Order.

20. That under the terms of the February 21, 1978 Order, on or before May 21, 1978, Respondent should have submitted his practice, whatever its nature, to review by the Peer Review Committee of the Medical and Chirurgical Faculty.

21. That the Respondent failed to submit his practice to review by the Peer Review Committee.

22. That no quarterly report has ever been received by the Commission from the Peer Review Committee since the Respondent failed to submit his practice to review.

23. That no quarterly report has ever been received from the Respondent's preceptor since he chose not to participate in the preceptorship program approved by the Commission and because even if he had chosen to participate in this program, no report would have been required prior to July 24, 1978 since the program was not established and approved until Apr. 24, 1978.

Conclusions of Law

Upon the foregoing Findings of Fact, the Commission makes the following conclusions of law:

1. That Respondent failed to undertake a minimum of five hours per week of Commission-approved continuing medical education in violation of the requirement of Condition #3 of the Feb. 21, 1978 Order.

2. That the Respondent unilaterally chose not to participate in the preceptorship program approved by the Commission in violation of Condition #4 of the Feb. 21, 1978 Order.

3. That the Respondent unilaterally and without the Commission's approval chose not to submit either his private or military medical practice to review by the Peer Review Committee of the Medical and Chirurgical Faculty in violation of Condition #6 of the Feb. 21, 1978 Order.

4. That because the Respondent failed to submit his medical practice to review by the Peer Review Committee no report was received by the Commission from the Peer Review Committee in violation of the requirements of Condition #7 of the Feb. 21, 1978 Order.

Order

Upon the foregoing Findings of Fact and Conclusions of Law, it is this 28th day of July, 1978, by the unanimous vote of those members of the Commission hearing this case,

ORDERED that based on violation of Conditions #3, #4, #6 and #7 set forth in the Commission's Feb. 21, 1978 Order, the Respondent's probationary status is terminated and the Stay of the Revocation of his license to practice medicine and surgery in the State of Maryland is hereby withdrawn so that as of the date of this Order the Respondent's medical license is REVOKED; and be it further

ORDERED that a copy of this Order shall be filed with the Board of Medical Examiners in accordance with Article 43, Section 130(m) of the Annotated Code of Maryland.

IN THE MATTER OF CORAL GORDON, MD, BEFORE THE COMMISSION ON MEDICAL DISCIPLINE, FINDINGS OF FACT, CONCLUSIONS OF LAW AND ORDER

Upon certain information coming to its attention pursuant to the provisions of Article 43, Section 130 of the Annotated Code of Maryland, the Peer Review Committee of the Baltimore City Medical Association initiated an investigation into the medical practice of the Respondent, Coral Gordon, MD. Thereafter, the Commission on Medical Discipline of Maryland, after considering the report and recommendation submitted by the Peer Review Committee, determined to charge the Respondent with certain violations of the Code. The violations charged involved the following subsection of Article 43, Section 130 (h):

(18) Professional incompetence.

Appropriate notice of the charges and the grounds from which they arose was given to the Respondent and a hearing on said charges was scheduled to be held on Nov. 21, 1978. Prior to the convening of that hearing, the Commission entered into discussion with Donald Barrick, Esq., the Respondent's counsel with regard to the charges. Following discussions between Mr. Barrick and Stephen J. Sfekas, Assistant Attorney General, counsel for the Commission, the Respondent agreed to enter into the following Consent Order. The Respondent does not admit that she has violated any of the provisions of Article 43, Section 130 of the Annotated Code of Maryland, but she acknowledges the validity of this Order in order to avoid the expense and unpleasantness resulting from these proceedings.

Findings of Fact

The Commission finds:

1. That the Respondent's medical records are inadequate.

2. That the obstetrical treatment Respondent renders in her performance of home births does not meet acceptable standards. The Commission makes no finding concerning the quality of Respondent's hospital practice. Furthermore, the Commission makes no finding as to the general question of whether a physician should perform home deliveries.

3. That the care rendered by Respondent to Joan Poehlman was unacceptably.

4. That the Respondent has made a significant improvement in the quality of her record-keeping since the beginning of the investigation of her case.

Conclusions of Law

Based upon the foregoing Findings of Fact, the Commission concludes as a matter of law that the charge of professional incompetence has been substantiated and that Respondent is GUILTY of that charge.

Order

From the foregoing Findings of Fact and Conclusions of Law, it is this 21st day of November, 1978, by the unanimous vote of eight members of Commission of Medical Discipline

ORDERED that the license to practice medicine and surgery heretofore issued to Respondent by Board of Medical Examiners is hereby suspended, and be it further

ORDERED that the said suspension is stayed with Respondent placed on probation subject to the following terms and conditions:

1. That the Respondent shall submit to continuing quarterly review of her practice by the Peer Review Committee of the Baltimore City Medical Association.

2. That the reports submitted to the Commission by the Peer Review Committee shall indicate that Respondent is practicing medicine in a competent fashion.

3. That Respondent shall engage in not less than 100 hours per year of Continuing Medical Education, for the duration of the probation. All of the continuing education shall qualify as category 1 credit as defined by the American Medical Association.

4. That the Chief of Obstetrics at any hospital at which the Respondent delivers babies must review each patient's condition and records. The Respondent will furnish the Commission with a satisfactory quarterly report from the Chief of Obstetrics as to the quality of her hospital practice. The Chief of Obstetrics

may delegate this function to a physician acceptable to the Commission.

5. That after Jan. 1, 1979, the Respondent shall not perform any deliveries in any location other than a hospital delivery room except in emergency situations. If Respondent should perform any deliveries outside of a hospital because of emergency, she shall promptly notify the Commission in writing of the circumstances.

6. That the Respondent shall not supervise the performance of home births by or collaborate with nurse-midwives or by any other person and be it further

ORDERED that if the Respondent violates any of the foregoing conditions, upon notification by and following a hearing, the Commission may lift the stay of suspension or impose whatever disciplinary sanction it deems appropriate upon any such showing; and be it further

ORDERED that if Respondent has complied with the terms of this Order to the satisfaction of the Commission for a period of three years from the effective date of this Order, the probation shall be lifted and shall be of no further effect and be it further

ORDERED that one year after the date of this Order, the Commission will entertain a petition to terminate the Respondent's probationary status; and be it further

ORDERED that a copy of this Order be filed with the Board of Medical Examiners of Maryland in accordance with Article 43, Section 130(m) of the Annotated Code of Maryland.

JOHN E. ADAMS, MD
Chairman

Consent

Notwithstanding my voluntary and knowing execution of this Consent, I do not concur in the findings of fact and conclusions of law made by this Commission.

By this Consent, I hereby accept and submit to the foregoing Order and its conditions. I acknowledge the validity of the Order as if made after a hearing at which I would have had the right to counsel, to confront witnesses, to give testimony, to call witnesses in my own behalf and to all other substantive and procedural protections provided by law. I also recognize that I am waiving my rights to appeal any adverse ruling of the Board that might have followed any such hearing. By this Consent, I waive all such rights and acknowledge that by my failure to abide by the conditions of my probation I may suffer the revocation or suspension of my license to practice medicine in Maryland.

I sign this Consent without reservation, fully understanding its meaning and after consultation with my counsel.

CORAL GORDON, MD

STATE OF MARYLAND, CITY OF BALTIMORE, to wit:

I HEREBY CERTIFY, that on this 21st day of November, 1978, before me, the subscriber, personally appeared CORAL GORDON, MD and she made oath in due form of law that the foregoing Consent is her voluntary act and deed.

AS WITNESS my hand and Notarial Seal.

Commission on Medical Discipline
201 W. Preston St.
Bal o., MD 21201.

Dear Commission Members:

Please be advised that I have decided to discontinue the practice of medicine. In accordance with that decision, 30 days from the date of this letter, I will terminate my practice of medicine and tender my license to the Commission. During this 30-day period, I will accept no new patients, will prescribe no Class II drugs, will cease dispensing drugs and will permit persons designated by the Commission to inspect my office and practice at any reasonable time. My decision to return my license and to discontinue the practice of medicine has, as you know, been prompted by an investigation of my medical practice conducted by the Commission on Medical Discipline. I recognize that the Commission has charged me with violation of Article 43, Sections 130 (h) (4) and (18) of the Maryland Code (crime involving moral turpitude, professional, physical and mental incompetence). I further realize that if the Commission's consideration of this matter had proceeded to completion, the Commission believes that it would have been able to substantiate that I am professionally incompetent to practice medicine, and that I plead guilty to a crime involving moral turpitude.

In executing this letter and agreeing to return my license to the Commission, I recognize and agree that my status as a resignee is the same as that of a person whose license has been revoked following a hearing before the Commission. In other words, I agree that if, in the future, I determine that I would like to once again practice as a physician, I will, at that time, approach the Commission in the same posture as one whose license has been revoked for the reason above set forth. In such event, I have been advised by the Commission that it will consider any evidence I might tender.

Finally, it should be pointed out that I have discussed this letter with my attorney and understand its import.

Very truly yours,

ALBERT BURWELL, MD

STATE OF MARYLAND

to wit:

CITY OF BALTIMORE

On this 11th day of July, 1978, before me, the undersigned officer, personally appeared ALBERT BURWELL, MD, and he made oath in due form of law that the foregoing is his voluntary act and deed.

As witness, my hand and notarial seal.

PHYSICIANS

ALERT

The Committee on Drugs has noted that many physicians prescribe Preludin as an anorectic drug for weight control. While this drug is not an amphetamine and therefore not covered under the State amphetamine regulations, its use should be extremely limited. Its actions include central nervous system stimulation and elevation of blood pressure. Preludin may be used in the management of exogenous obesity as a short-term (a few weeks) adjunct in a regimen of weight reduction based on caloric restriction. Contraindications include advanced arteriosclerosis, symptomatic cardiovascular disease, moderate to severe hypertension, etc. Tolerance usually develops within a few weeks and when this occurs, the recommended dose should not be exceeded in an attempt to increase anorectic effect; rather, the drug should be discontinued. See your PDR for further details.

COMPLIMENTS,

COMPLIMENTS

During the first week in June, the Faculty received several letters from patients expressing their appreciation of services rendered to them by their physicians. In addition, the Faculty has also received complimentary letters from physicians expressing their pleasure with services offered to them by the Faculty.

NEW

PHARMACY

ASSISTANCE

PROGRAM

Individuals who are not eligible for full Medicaid benefits can now apply for assistance under the Maryland Pharmacy Assistance Program. Individuals may receive an income higher than an ordinary Medicaid recipient and qualify for these benefits. Income limitations are: \$4,100 for a single person, \$4,600 for two persons, and a graduated scale for additional individuals in the family unit.

Under this program, an individual must pay \$1.00 for each prescription and each refill and the State pays the rest.

Further details can be obtained from the Faculty office, the Department of Health, the Pharmacy Association or the local Department of Social Services.

RESOLUTIONS

DEADLINE

Resolutions for consideration at the Faculty's Semiannual meeting of its House of Delegates must be in the Faculty office AT LEAST EIGHT WEEKS PRIOR TO THE DATE OF THE MEETING. This would mean that all resolutions must be received prior to the close of business on

FRIDAY, AUGUST 3, 1979.

INTERPRETERS
NEEDED

Several years ago, the Auxiliary of the Faculty developed a list of individuals who could converse in foreign languages. This was, and is used for communication between a physician and patient who may have difficulty in expressing physical complaints or symptoms in English.

The Faculty is attempting to update this listing so it can respond to queries from physicians, hospitals, and others who are in need of an interpreter. If you or your spouse can perform this public service in behalf of the Faculty, would you please drop us a note to "Foreign Language" at the Faculty or telephone us at (301) 539-0872, indicating what special language skills you have.

SEMIANNUAL
SESSION

Plans are now underway for the Semiannual session to be held in New Orleans, Louisiana, September 12-16, 1979. The House of Delegates session will be held in Baltimore at the Faculty Building on Saturday, September 29, 1979 commencing at 2 PM. The General Meeting of the Faculty will be held immediately following adjournment of the House meeting.

Reservations for the New Orleans meeting should be made through the Travel Guide Agency (Patricia Orem; 727-1811). Cost of the entire trip, including air fare, baggage handling, airport transfers in New Orleans, a welcome cocktail party, a breakfast at Brennans, and a farewell dinner - \$489 per person.

WORKSHOP
IN
JULY

A Practice Management Workshop for established physicians to improve appointment scheduling, increase collections, develop effective personnel policies, and reduce paperwork has been scheduled for Wednesday, July 18, at the Quality Inn, Towson. The workshop qualifies for 8 Category I CME credits. Registration is \$85.00 and spouses may audit for \$10.00. Reservations should be made with Mary Galeckas at the Faculty office.

PHYSICIAN
FEE AND
COST
INDICATORS

Physician Fee and Cost Indicators is included as an insert in the May 18, 1979 issue of AM NEWS. This booklet is an attempt to assist physicians in tracking costs and fees.

The first part of a dual system, the Physician's Fee Index (PFI) presents a method to measure the approximate overall rate of increase in your fees—for your information and for comparison with other economic gauges (such as the Consumer Price Index).

Conduct with Pronestyl® Tablets

Procainamide Hydrochloride Tablets

The only procainamide in
veneer-coated, easy-to-swallow tablets

250 mg

375 mg

500 mg

- available in 3 tablet strengths for easier dosage adjustment—up or down—in all patients
- produced under exacting quality control standards by Squibb—numerous critical control tests from starting material to finished product
- offered only under the Squibb label—your assurance of reliable, quality therapy for life-threatening arrhythmias.

See following page for brief summary

PRONESTYL® TABLETS

Procainamide Hydrochloride Tablets

The prolonged administration of procainamide often leads to the development of a positive anti-nuclear antibody (ANA) test with or without symptoms of lupus erythematosus-like syndrome. If a positive ANA titer develops, the benefit/risk ratio related to continued procainamide therapy should be assessed. This may necessitate considerations of alternative anti-arrhythmic therapy.

DESCRIPTION: Pronestyl (Procainamide Hydrochloride) is the amide analogue of procaine hydrochloride and is available for oral administration as veneer-coated tablets providing 250 mg, 375 mg, and 500 mg procainamide hydrochloride.

CONTRAINDICATIONS: In patients with myasthenia gravis and where a hypersensitivity to procainamide exists; bear in mind cross sensitivity to procaine and related drugs. Should not be given to patients with complete atrioventricular heart block. Contraindicated in cases of second degree and third degree A-V block unless an electrical pacemaker is operative.

PRECAUTIONS: Evidence of untoward myocardial responses should be carefully watched for in all patients. In the presence of myocardial damage with atrial fibrillation or flutter, the ventricular rate may increase suddenly as the atrial rate is slowed; adequate digitalization reduces but does not abolish this danger. Ventricular tachysystole is particularly hazardous if myocardial damage exists.

The dislodgment of mural thrombi producing an embolic episode may occur in correcting atrial fibrillation due to the forceful contractions of the atrium.

Extreme caution is required in attempting to adjust the heart rate when ventricular tachycardia has occurred during an occlusive coronary episode or where the use of procainamide may result in additional depression of conduction and ventricular asystole or fibrillation as in second degree and third degree A-V block, bundle branch block, or severe digitalis intoxication.

Bear in mind when treating ventricular arrhythmias in patients with severe organic heart disease and ventricular tachycardia that complete heart block, which may be difficult to diagnose, may be present. Since asystole may result if the ventricular rate is significantly slowed without attainment of regular atrioventricular conduction, procainamide should be stopped and the patient re-evaluated.

In the presence of both liver and kidney damage, normal dosage may produce symptoms of over-dosage—principally ventricular tachycardia and severe hypotension.

A syndrome resembling lupus erythematosus has been reported with oral maintenance procainamide therapy. Common symptoms are polyarthralgia, arthritis and pleuritic pain. Fever, myalgia, skin lesions, pleural effusion and pericarditis may also occur. Rare cases of thrombocytopenia or Coombs-positive hemolytic anemia, possibly related to this syndrome, have been

reported. Measure anti-nuclear antibody titers at regular intervals in patients on procainamide for extended periods of time or in whom symptoms suggestive of lupus-like reaction appear; in event of rising titer (anti-nuclear antibody) or clinical symptoms of LE, assess the benefit/risk ratio related to continued procainamide therapy (see boxed Warning). Steroid therapy may be effective if discontinuation of procainamide does not cause remission of symptoms. If the syndrome develops in a patient with recurrent life-threatening arrhythmias not otherwise controllable, steroid-suppressive therapy may be used concomitantly with procainamide.

ADVERSE REACTIONS: Hypotension is rare with oral administration. Serious disturbances of cardiac rhythm such as ventricular asystole or fibrillation are more common with I.V. administration.

Large oral doses may sometimes produce anorexia, nausea, urticaria, and/or pruritus.

A syndrome resembling lupus erythematosus has been reported in patients on oral maintenance therapy (see Precautions). Reactions consisting of fever and chills have been reported, including a case with nausea, vomiting, abdominal pain, acute hepatomegaly, and a rise in serum glutamic oxaloacetic transaminase following single doses of the drug. Agranulocytosis has been occasionally reported following repeated use of the drug, and deaths have occurred. Therefore, routine blood counts are advisable during maintenance procainamide therapy; and the patient should be instructed to report any soreness of the mouth, throat or gums, unexplained fever or any symptoms of upper respiratory tract infection. If any of these symptoms should occur and leukocyte counts indicate cellular depression, procainamide therapy should be discontinued and appropriate treatment should be instituted immediately. Bitter taste, diarrhea, weakness, mental depression, giddiness, psychosis with hallucinations, and hypersensitivity reactions such as angioneurotic edema and maculopapular rash have been reported.

For full prescribing information, consult package insert.

HOW SUPPLIED: Pronestyl Tablets (Procainamide Hydrochloride Tablets) providing 250 mg, 375 mg, and 500 mg procainamide hydrochloride are available in bottles of 100 and Unimatic® single-dose packaging in cartons of 100. The 250 mg and 500 mg tablets are also available in bottles of 1000.

The Louis A. M. Krause History of Medicine and Rare Book Collection

During my one-and-a-half years as Faculty Librarian and contributor to this column, I have said virtually nothing concerning the Faculty Library's History of Medicine and Rare Book Collection. This collection consists of approximately 17,000 volumes, including antique and rare medical texts, as well as current materials related to the history of medicine. Also included are many manuscripts and archival materials, such as minute books, day books and ledgers from early Maryland hospitals and physicians' practices, and notebooks of medical students, dating back to the mid-18th Century. For this column, I have selected a few of the rarest treasures belonging to the Faculty to describe briefly and show their importance to medicine.

First, however, some comment is due concerning the manner in which this enviable collection was assembled. The Faculty Library dates back officially to July 1, 1830, and next year will be its 150th anniversary; however, the prospect of a medical library for privately-practicing physicians was on the minds of the Faculty's founding physicians as early as 1798. To provide for the dissemination of medical information throughout Maryland is one of the charges laid upon the Faculty in its 1798 Charter.

The Faculty Library was built up mainly from the contributions of member physicians. Among the Faculty's rare books are some bearing the signatures or bookplates of many of the founding physicians; for instance, the Faculty Library possesses the entire libraries of Upton Scott, the first President of the Faculty, and John Archer, who prefigured the goals of the Faculty with his apprenticeship school and medical society in Harford County during the early years following the American Revolution. Many of the items that were standard texts and reference sources during the period of the founding of the Faculty are today extremely rare and valuable.

The tradition of building up the Library's collection through contributions of personal collections continued throughout the Faculty's history; indeed, few of the rare items in the Faculty's History of Medicine collection were purchased. This is true of the three medical incunabula in the Faculty Library's possession, as well as its first, second, third and fourth editions of Vesalius and its copy of the first edition of Withering's *Account of the Foxglove*. In 1974, the Faculty Council appropriately named the historical and rare book collection after the late Louis A. M. Krause, MD, who served for many years as Chairman of the Faculty's Library Committee.

When a medical historian or book collector visits a collection of rare medical books, one of his first questions is likely to be, "What incunabula do you have?" The Faculty Library possesses three items in this category; that is, books printed before 1501. The medical books of this period constitute the current medical literature of the last third of the 15th Century, and also the first printed editions of the classics of the prior 19 centuries that had previously circulated only in manuscript form.

The oldest book in the Faculty's collection is *Liber Metricus de Pulsibus cum Commentarie Gentilis Fulginatis*, by Aegidius Corboliensis (also known as Gilles de Corbeil, 1165-1213), published in Padua in 1484 by Matthaeus Cordonis de Windischgretz. Aegidius, a graduate of Salerno, was physician-in-ordinary to King Philip of France. He is best known for his two poems, *De Pulsibus* and *De Urinis*. Gentilis Fulgino, whose commentary accompanies *De Pulsibus* in this edition, was the most celebrated physician of his time, serving as Professor of Medicine at Ferrara and at Padua. He died a victim of the plague in 1349.

Aurelius Cornelius Celsus lived and wrote in the 1st Century AD. His Latin style earned him the title "Cicero Medicorum." His

monumental *De Medicina* was the greatest medical treatise to come from ancient Rome and the first western history of medicine. The Library's copy was published in Venice by Philippus Pincius for Benedictus Fontana in 1497 and was already the fourth edition of this great work. In *De Medicina*, Celsus categorizes diseases according to methods of treatment: diet, regimen, drugs and surgery. Celsus was the first to discuss the treatment of insanity and heart disease, for which he suggests treatment by diet and regimen. *De Medicina* also contains the first accounts of the use of ligature, the earliest discussion of surgical remedies for mutilations (plastic surgery) and excellent descriptions of lateral lithotomy and herniotomy.

Petrus de Abano lived during the last half of the 13th Century and early 14th Century. The Library owns a copy of his *Treatise on Poisons*, published in Leipzig in 1498, the fifth printed edition. Petrus de Abano's works illustrate the speculative nature of medicine during his time. Among the subjects he discusses are: "Is the brain of hot or moist complexion?" "Is manhood better than childhood? or youth?" "Is life possible south of the equator?" "Is the white of the egg hot and the yolk cold?" De Abano was called "the great conciliator" for his attempts to bring religion, philosophy and medicine together in a rational synthesis; however, this got him into trouble with the Inquisition, and he died while on trial for blasphemy. The court found him guilty, anyway, and his corpse was burned at the stake.

To fully appreciate the antiquity and importance of these three earliest items in the Faculty Library, one should recall that all were printed, and used by physicians, during the same period that Columbus was making his voyages to the New World.

After inquiring about and examining the incunabula in a collection of rare medical books, a visitor's next question frequently is, "Do you have a Vesalius?" *De Humani Corporis Fabrica Libri Septem*, by Andreas Vesalius, published in Basel by Johannes Oporinus in 1543, has been called "The greatest and most beautiful book in the history of medicine." The Faculty Library is fortunate to own a very fine copy of the 1543 first edition, and also a copy of the 1555 second edition. Each contains a beautiful woodcut title page, a portrait of Vesalius, 19 full-page woodcuts, and hundreds of smaller historiated initials and woodcuts based upon drawings by Vesalius and artists from the school of Titian. (Historical scholars today attribute most of the woodcuts to John Stephen of Calcar.)

Because of its unique blend of illustrations, text and typography, *De Humani Corporis Fabrica* is one of the most beautiful and magnificent volumes in the history of all printing. It stands unsurpassed as a work of creative art in the true spirit of the Renaissance.

The first edition was published the same year as Copernicus' *De Revolutionibus* and had as much, or greater, effect on medicine and man's knowledge of himself as Copernicus' work had on astronomy and the concept of man's place in the universe. Vesalius founded modern observational science and research by teaching physicians how to derive accurate information about the anatomy and physiology of the human body from actual dissection and careful observations.

Bernardus Eustachius lived in the same period as Vesalius. Had his anatomical copperplates been published in 1552 when they were completed, Eustachius would have ranked at least equally with Vesalius as one of the founders of modern anatomy. Eustachius died before he was able to publish his *De Dissensionibus ac Controversiis Anatomicis*, for which he had prepared 39 copperplates. The plates were passed on to Eustachius' relatives and were thought lost until discovered in the early 18th

Century by the great Papal physician Lancisi. In 1714, Lancisi published the plates along with his own commentaries. Eustachius' original commentaries have never been found.

The Library owns a very fine copy of the 1714 edition of Eustachius' *Tabulae Anatomicae*, published in Rome by Francisci Gonzague under the supervision of Lancisi. Eustachius is known for his discovery of the Eustachian tube, the thoracic duct, the adrenals and the abducens nerve. He also gave the first accurate descriptions of the uterus, the cochlea, the muscles of the throat and the origin of the optic nerves. He surrounded his illustrations with graduated scales instead of printing letters on the figures; the numbers on each frame provided coordinates for the pictured space so that any anatomical part could be described in the text and easily located in the illustrations.

One of my own favorite early medical books is Jacob Rueff's *De Conceptu et Generatione Hominis*. The Library's copy is the second Latin edition and the first edition with illustrations by Jost Amman, published in Frankfurt by Sigismund Feyerabend in 1580. Rueff's work was intended to be a guide for midwives. It gives a comprehensive picture of obstetrical knowledge during the early 16th Century, including the current state of embryology and knowledge of birth defects. The Amman woodcuts are what makes this book most attractive to me. They illustrate many aspects of childbirth, including the engaging of a midwife by a woman having the first signs of pregnancy, the delivery of the child using a birthing stool and the husband and wife celebrating their good fortune. The illustration of the childbirth scene is especially amusing because, while the female midwife and her two female assistants surround the mother-to-be in the birthing stool and are busy assisting her, the husband and another man (perhaps the physician) are shown near a window in the background doing the really important work—they are studying the stars and casting the new baby's horoscope! Also, in the illustration on the title page, which attempts to portray several different stages of childbirth in a single illustration, what is interpreted to be the final scene depicts the midwife enjoying a large tankard after the successful delivery.

William Hunter labored for 30 years to produce his classic *Anatomia Uteri Humani Gravidi Tabulis Illustrata, The Anatomy of the Human Gravid Uterus, Exhibited in Figures*. This is a very large folio consisting of 34 copperplates by Jan van Rymsdyk and Robert Strange, each with a facing explanation leaf with text in English and Latin. The Faculty Library owns two copies of the first edition, printed by John Baskerville in Birmingham, England, in 1774. This is one of the most beautiful anatomical atlases ever published, anatomically exact and artistically perfect. It is one of the very few great medical books issued by a private press. Its original price of six guineas was a huge sum, even for physicians, in 1774.

Foxglove (*digitalis purpurea*) was used empirically by herbalists for hundreds of years to treat dropsy and chest pains. It was not until 1785, however, that its efficacy was scientifically established. In that year William Withering published *An Account of the Foxglove and Some of Its Medical Uses*. The book contains 207 pages, and one large, folding, hand-colored plate of *digitalis purpurea*. It was published in Birmingham, England, by C.G.J. and J. Robinson. The Library's copy, with the foxglove illustration facing left, is considered to be the first edition, first state, of this great work. The book is a pharmacological classic in that it reports one of the first modern clinical studies of a drug. Withering summarized 10 years of careful research on *digitalis*, and as a result the action of the drug in dropsy and on the heart became generally recognized and accepted by the medical profession. Withering honestly recorded both the successes and failures in his trials with the drug. He learned to employ *digitalis* only in selected cases of dropsy, and he stressed that the dose must be carefully adjusted. He described the signs and symptoms of *digitalis* toxicity and established clear guidelines for rational use.

The greatest and most beautiful atlas of pathology was produced in 40 serial parts by Jean Cruveilhier between 1829-42. These parts are known collectively under the title *Anatomie Pathologique du Corps Humain, ou Descriptions, avec Figures Lithographiées et Coloriées, des Diverses Altérations Morbides dont le Corps Humain est Susceptible*. This great work includes 333 brilliantly hand-colored lithographed plates. The sections

were published in Paris by Baillière.

Cruveilhier obtained his autopsy material in the deadhouse of Salpêtrière and the Musée Dupuytren. In this work, Cruveilhier first described disseminated sclerosis, Cruveilhier's palsy, hypertrophic pyloric stenosis and ulceration of the stomach due to hyperacidity. The atlas also contains remarkable plates of a cerebellopontine angle tumor and falx meningoma.

One of the best known of all early American medical classics is William Beaumont's *Experiments and Observations on the Gastric Juice, and the Physiology of Digestion*, with three text illustrations of a gastric fistula. The Library has three copies of the first edition, published by F. T. Allen in Plattsburg, NY, in 1833. Beaumont was a surgeon in the US Army. A young French-Canadian voyageur, Alexis St. Martin, developed a permanent gastric fistula, the result of a gunshot wound. In caring for St. Martin, Beaumont recognized the unique opportunity to study digestion and the movements of the stomach "in vivo." The work is a classic in physiology.

Between 1847-49, Ignaz Philip Semmelweis published his initial papers showing puerperal fever to be a septicemia. Even though Semmelweis' prescription for the washing of physicians' hands in calcium chloride solution before the examination of childbed cases resulted in a reduction of five-sixths in infant mortality, the ridicule, opposition and persecution that greeted Semmelweis' papers forced him to flee from Vienna to Budapest. He continued his work in Budapest and became Professor of Obstetrics at the University there. In 1861, his monumental work, *Die Aetiologie, der Begriff und die Prophylaxis des Kindbettsiebers*, was published by C. A. Hartleben in Budapest.

The American, Oliver Wendell Holmes, was five years ahead of Semmelweis in determining that childbed fever was spread from one obstetrical patient to another by the unwashed hands and clothes of attending physicians. Semmelweis was completely unaware of the work of Holmes. Still, the work of Semmelweis is superior to that of Holmes in that he recognized puerperal fever as a blood poisoning of septicemia. While *Die Aetiologie* is a monumental work, Semmelweis was a very poor writer; his book is difficult to read and filled with masses of badly-presented statistics. Because Semmelweis' ideas were unpopular and his reactionary and jealous colleagues fiercely opposed them, the publisher ran a very small edition of the work; even so, the majority of the copies went unsold and were probably sent to a papermill to be pulped and recycled. This accounts for the *Aetiologie's* being one of the rarest and most difficult to obtain of all medical texts. The Faculty's copy of *De Aetiologie* is very fine, with the original paper covers bound in.

This small group of commentaries hardly does justice to the extensive collection of rare medical books that are part of the heritage of the privately-practicing physicians who constitute the membership of the Faculty. The 17,000 volumes in the Louis A. M. Krause Collection in the Faculty Library represent the finest thinking and practices of physicians throughout 2-3,000 years, and this fine collection continues to grow in importance and value through the gifts of Faculty members today, not only of items from their own private libraries, but also of autographed copies of their own written contributions to the advance of medical progress.

Lack of space prevents discussion of the manuscripts and archives in the Faculty Library's History and Rare Book Collection at this time, but that can wait for another column.

Chapter 14

Medicine in Maryland During the Civil War

"We operated in old blood-stained and often pus-stained coats, the veterans of a hundred fights. We operated with clean hands in the social sense, but they were undisinfected hands. . . . We used undisinfected instruments from undisinfected plush-lined cases, and, still worse, used marine sponges which had been used in prior pus cases and had been only washed in tapwater. If a sponge or an instrument fell on the floor, it was washed and squeezed in a basin of tapwater and used as if it were clean."
W. W. Keen¹

The history of medicine in Maryland during the Civil War is largely a story of the battles, the care of the wounded and the military hospitals. The scientific advances based on war experience were largely in sanitary reform rather than improvement in the treatment of individual patients with surgery or medication. The demonstration of the necessity for sanitary reform in camps, hospitals and on the march was a preparation for the public health movement in the last part of the 19th Century. Many of the leaders in this movement had been convinced from war experience about the importance of clean camps, clean quarters and clean water. These matters are, however, part of the history of medicine in the United States rather than Maryland.

In this chapter, we have tried to give the story of a desperately-wounded Maryland soldier and how he was treated on the battlefield; we have attempted to describe the Battle of Sharpsburg from a medical point of view (including preparation, reports from the front and hospital experience); the dispersal of the wounded after the Battle of Gettysburg, the Battle of the Monocacy and the Union military hospitals in Maryland during the Civil War.

How A Wounded Man Was Cared For

An account of how a wounded man was cared for reveals many of the battlefield realities of the Civil War. The wounded man was a Marylander, Major Richard Snowden Andrews, CSA, commanding the First Maryland Artillery (Andrews Battalion). The battle was that at Cedar Creek, VA, Aug. 19, 1862. In this battle, the Confederates were so hard-pressed by superior numbers that General Thomas "Stonewall" Jackson drew his sword and rallied his men. The enemy finally was defeated.

Maj. Andrews advanced his guns in the face of a charging column of infantry and drove it from the field. Here, however, soon after Gen. Winder was struck, Andrews, too, received what was probably the worst wound any man ever survived. A piece of shell struck the lower part of his right side, tearing apart the wall of the abdomen. With wonderful presence of mind, he

pressed his hand over the wound, then threw his other arm around his horse's neck so that he could fall to the ground on his back to keep from being disemboweled. He laid on the dusty roadside for two to three hours . . . Gen. A.P. Hill, who was bringing up troops on the other side of the fence under cover of the woods, stopped for a moment to find out who it was, and promised to send an ambulance and surgeon at the first possible moment . . . it was not until after a long period of waiting that a surgeon came riding by with his attendants and stopped to examine the wound. He told (Andrews) frankly that there was no hope, for the shell had torn deep through the abdomen even to the intestines. As he was riding away (Andrews) called to him to say that once while fox-hunting he had seen a valuable dog almost disemboweled in getting over a fence, that he had taken him home and cared for him and the dog had lived to hunt again. This touched the heart of the surgeon and it was not long after this that an ambulance was sent. (Andrews) requested that instead of taking him to the usual place (a field hospital), he might be taken to the farmhouse where he had spent the previous night sleeping on the porch beside Gen. Jackson. Arrived at the farmhouse, they laid him on the floor and as no Army surgeon was at hand, they went out and stopped a country doctor, Dr. Amos, who was passing. On looking at the wound, Dr. Amos said there was nothing to be done and there was no chance for life. (Andrews) said "Isn't there a chance in 10, or 20 or even a hundred?"

"Well," replied Dr. Amos, "Since you are so plucky, I'll do the best I can for you," thinking to himself that he would at any rate make the body more sightly. He then washed out grit and bits of cloth from the wound and proceeded to sew it up, using the only needle he had, which was a rusty one, and having no anesthetic or disinfectants. Then he was placed on the bed and, as I said before, there was no further treatment possible except applications of cold water.²

This description of Andrews' care reveals in a remarkable way the attitude toward death and wounding during a major battle. Andrews subsequently recovered completely, but he had to persuade the Army surgeon to get him an ambulance by telling a story about a dog he had saved. Later, a local physician had to be called in and persuaded to sew up his abdomen. Death was taken for granted. It was assumed that for certain wounds nothing whatsoever could be done, and the patient was left to die as best he could on the battlefield. Such treatment of an American soldier on a present day battlefield would call for a Congressional investigation.

Adams (1) notes that abdominal wounds in the Civil War kept surgeons humble, since no earthly intervention seemed to help. The overall mortality for abdominal wounds was 87%, 100% for small intestinal wounds. Survival rate was about 59% in wounds of the large intestine.

Probably 150,000 Southern soldiers lost their lives during the War. Only about 50,000 were attributable

to battle wounds. The Union figures are 224,586 deaths owing to disease and 110,070 to the battlefield.²

In the Sharpsburg Campaign, 8,724 Confederate soldiers were wounded. The highest recorded losses in casualties during the Civil War were those of the Union's First Minnesota at the Battle of Gettysburg, where there were 85.5% casualties. In the same battle, the Confederates' 26th North Carolina probably suffered greater losses, but their records were so poor that the actual report gave only 71.7% killed and wounded.³

Civil War Battles Fought in Maryland

Two crucial battles of the Civil War were fought in Maryland, and one just beyond its northern border at Gettysburg. Each was part of an unsuccessful invasion of Maryland by Confederate troops. At Sharpsburg (also known as Antietam, Sept. 17, 1862), the bloodiest day in American history (20,000 casualties), the Northern Army under Gen. George McClellan turned back Gen. Robert E. Lee's veterans at a cost which lost the campaign for the South. At Gettysburg (July 1-3, 1863) the Northern Army under Gen. George G. Meade again turned back Lee at a terrible cost (43,500 casualties). The third, at the Monocacy near Frederick (July 9, 1864), was hardly more than a skirmish (1,590 casualties). Gen. Jubal A. Early's Confederate troops routed Gen. Lewis Wallace's Union forces, but Early's troops were delayed long enough to prevent the capture of Washington.

From each of these battles, the wounded were cared for in Maryland, sometimes in established army hospitals at Baltimore, sometimes in tents, churches or houses on the battlefield.

The surgeons of the Civil War possessed little more skill than those of the Revolutionary War. Chloroform, when available, was an excellent anesthetic and the use of quinine in malaria was better understood. Phlebotomy, calomel and cathartics as items of therapy were no longer popular. The real medical advances resulting from the Civil War were the carefully collected statistics in the *Medical and Surgical History of the War of the Rebellion*,⁴ the realization of the importance of sewage disposal, pure water and sanitary engineering, not only in war but in civilian life and the development of the Medical Department of the US Army.

The Sharpsburg Campaign (Antietam, Sept. 17, 1862)

1862 was a disastrous year for the Union on the battlefields of Virginia. In May and June, Stonewall Jackson, strange college professor and Presbyterian deacon, had defeated three Union armies operating in the Shenandoah Valley. He had denied 60,000 Union troops needed by McClellan in his attack on Richmond.

By July, Lee and Jackson had shredded McClellan's tremendous army attacking Richmond from the East. Charles S. Tripler had been Union Medical Director during this campaign. The medical care, hospitals and transportation of wounded had all been fumbling and inadequate, not owing to any fault on Tripler's part, but because the Medical Department

was a low priority on receiving transportation and supplies and depended upon inexperienced volunteers. In his report on the campaign, Tripler attacked his critics with vigor and was replaced by Jonathan Letterman as Medical Director on July 4, 1862.

On Aug. 29th and Sept. 1st, on the old Bull Run Battlefield, Lee routed Gen. John Poper's Army of Virginia attacking Richmond from the North. Here the care of the wounded was incredibly inept. Surgeon Thomas A. Parlin, the Medical Director in charge, was completely unprepared. There were insufficient ambulances; the hospitals were poorly-placed and understaffed. Destroyed roads and bridges made movement of the wounded difficult. Civilian ambulance drivers, hired by the Quartermaster Corps, simply ran away terrified; 3,000 wounded lay where they had fallen three days after the battle. Despite the cooperation of the Confederate Surgeons, the last Union wounded were not picked up for seven days.

Following this disaster, Surgeon Gen. William Alexander Hammond concluded that the Army must have an Ambulance Corps responsible to the Medical Department rather than to the Quartermaster Corps.

Since his appointment as Medical Director in July, Letterman had spent his time organizing and training an effective Ambulance and Hospital Corps which had the necessary support of Hammond.

Sharpsburg was Letterman's opportunity. He had a clear idea of how the Medical Department should be organized and was a good administrator, but above all, was lucky that the battle was a Union victory, that the roads and communications were relatively good, that the Union Army remained in control of the battlefield and that there were multiple sources of supplies from New York, Philadelphia, Baltimore and Washington.

The result was that Letterman was able to realize his plan for the Army of the Potomac Ambulance Corps, which was made up of ambulances taken from smaller units and organized into Corps and Division Units and manned by a group of soldiers especially trained and assigned to the Medical Department.

There were shortages of medicines, instruments, dressings and stores. Very few medical officers had been able to renew their supplies and were worn down by their labors. It was necessary to prepare for the campaign in Maryland as quickly as possible. Hospital wagons were directed to report to Frederick on Sept. 13th; supplies were ordered from Baltimore. The decision to establish hospitals in Frederick was made on Sept. 13th. Most medical supplies had been removed or destroyed by Confederate troops, who left the city the day before Letterman's arrival (Jonathan Letterman's report on the Sharpsburg Campaign).⁴ The destruction of the bridge at the Monocacy River interrupted railroad connection between Frederick and Baltimore.

The medical supplies of the Confederate Army were of course far more depleted than those of the Union Army. Supplies captured at Harper's Ferry, just before the battle were of no help. In addition, the men were ragged, shoes were deplorable and food was insufficient in amount and quality.

The battle was fought along the Sharpsburg-Hagerstown Rd., running almost due north through the town of Sharpsburg in Western Maryland. The road was just to the west of Antietam Creek, which the Union Army had to cross to attack the Southern Army along the road. Behind the Southern Army was the Potomac River, passable only at a few fords.

The Maryland Campaign had started when Lee's troops had crossed the Potomac on Sept. 5-6th at White's Ford 25 miles northwest of Washington. (In 1934, the author, while exploring White's Ford, with the late Civil War authority, R.E. Lee Marshall, met a Mr. Curley who had seen the troops cross in 1862. The men were ragged and thin, but enthusiastic.) He advanced north toward Frederick. Because his army was divided (Jackson captured Harper's Ferry), he withdrew behind South Mountain, rapidly, decisively followed by the Union Army under McClellan.

There were two passes (Turner's Gap and Crampton Gap) through South Mountain which the Confederates defended as they withdrew to the west. The unexpected decisiveness of McClellan, the Union commander, was explained by the fact that he had in his possession a complete copy of Lee's plans for the campaign. These orders were found, wrapped around some cigars, by a Union soldier. Their importance was recognized and they were taken to McClellan. To this day their loss has not been explained.

On Sept. 14th, the Battle of South Mountain occurred. Churches and other buildings in Middletown, as well as houses and barns in the vicinity of the battle, were taken to receive the wounded. These hospitals were inspected by Letterman on the night of the battle. On the following morning, surgeons made rounds of the hospitals to consult on those patients needing immediate surgery. The local ladies assisted in caring for the wounded.

The Battle of Crampton's Gap occurred on the same day (Sept. 14th). Hospitals for the wounded were located at Burkettsville about a mile from the battlefield. About 1,800 Confederates and a like number of Federals were wounded or died in these two engagements.

On the night of the 15th, Letterman reached the site of what proved to be the Battle of Sharpsburg. A survey of the countryside with the positions of the troops was made, and corps medical directors were instructed to form their hospitals by divisions. The most appropriate type of housing for the wounded was a large, well-ventilated barn with plenty of hay, straw and water.

The battle began on the evening of Sept. 16th, was renewed on the 17th and continued until night.

The Battle of Sharpsburg was really three battles. There were three separate Union assaults on the Confederate left (by Hooker's Corps in the early morning, by Mansfield's Corps around noon and by Sumner's Corps slightly thereafter). Each of these attacks by fresh Federal troops was straight south on the Sharpsburg-Hagerstown Rd. Each split the Confederate line and almost reached the Dunker Church. A slightly sunken country lane served the Confederates as a trench

and the dead and wounded here led to the name "Bloody Lane." Each attack was stopped by the Confederates.

In the center, a second separate attack in the early afternoon was stemmed by the Confederates.

On the Confederate right, a massive afternoon onslaught by Gen. Burnside was stopped only with the providential arrival of Gen. A. P. Hill's troops from Harper's Ferry; thus, the greatest carnage was on the Confederate left.

Letterman visited various hospitals. There was an acute shortage of medical supplies as well as of food for the wounded. There was also a shortage of ambulances. Most of the wounded were removed from the right side of the Federal battle line before two o'clock on the 18th and from the left, where no well-organized ambulance system existed, by the night of Sept. 18th. The number of Federal wounded was 8,350. Many of the wounded were removed to Frederick by ambulance. They halted at Middletown for food and rest. In addition to the hospitals in Frederick, two 1,000-bed tent hospitals were erected. One large hospital established in Frederick some months previously was already filled with Confederate sick and wounded who had been left there. Six buildings in the city were used as hospitals, and contained 2,321 patients on Sept. 30th; 62 surgeons, 15 medical cadets, 22 hospital stewards, 539 nurses and 127 cooks were on duty.

All Confederate wounded were removed as rapidly as recovery would permit. Surgeon J. H. Ranch, USA, was assigned to administer medical care and removal and direction of Confederate medical officers who had been left to look after their wounded.

A great many civilians came to the hospitals attempting to remove their relatives to homes. Letterman was convinced those taken care of in barns did better than those in houses, whereas those taken care of in the open did better than those cared for in barns.

Some writers have labeled surgery on the battlefields as butchery. Letterman's opinion was that surgery was probably too conservative.

As a result of the experience from the battle, a new system of medical transport and a clearer definition of the surgeon's responsibilities was inaugurated on Oct. 4, 1862.

Sharpsburg (Sept. 17, 1862) At the Front

A number of Union official reports are available⁴ tracing the medical activities from the field at Sharpsburg to the general hospital.

Asst. Surgeon John T. Reily, of Gen. Franklin's Corps, was assigned to the extreme right of the Federal line on Sept. 17th. The field was literally covered with killed and wounded, and it was extremely difficult to move on horseback without injuring the wounded. The confusion of getting troops into position prevented removal of the wounded, and they were under fire for several hours. Most of the wounded were removed to hospitals by night. "The night was occupied in dressing wounds, arresting hemorrhage and preparing for oper-

ations." On the afternoon of Sept. 18th, wounded were removed under a flag of truce.⁴

Asst. Surgeon A.A. Woodhull reports that he was on duty on the field. The wounded were brought on stretchers to him and ambulances carried them a couple of miles to the field hospital. A few primary operations under chloroform were performed prior to going to the hospital.⁴

Surgeon C.F.H. Campbell reported "The carnage was fearful among the rebel troops on the right . . . our casualties consisted mainly of wounded, the majority of whom were shot in the lower extremities or from the waist down, the reverse being the case among the rebel wounded."

Campbell was assigned to duty in Frederick as Medical Director of Transportation of Sick and Wounded. The wounded were sent to Washington, Baltimore and Philadelphia; 1,356 were sent to Baltimore, transported by freight cars, the bottom of the cars being covered with straw or hay. One train of cars carried as many as 1,200 patients.⁴

In a Hospital

("A hospital alone shows what war is."—Erich Maria Remarque, author of *All Quiet on the Western Front*.)

The following letter written in Sharpsburg by Daniel Ford, SJ to Frederick Home Hack shortly after the battle, gives an insight into a hospital overwhelmed by wounded:⁵

Ah me! How heartily I wished, while passing through these aisles of misery's temple, that I might have you at my side. I longed for you at every step; for here is war stripped in these smashed limbs, these amputated members, these horrible disfigurements, this offensive stench, these agonizing deaths, these ravings and these groans. Here battle is no longer decked in the tinsel glow of glory and honor which the devil in all ages has succeeded in flinging over it by means of his faithful ministers, the poets and romancists and historians. And if sights and sounds like these could not sicken you of war, and divorce you from the blind ambition that has fooled many an older head than yours, then you are beyond anything I might do for you. I found one man with the upper front of the skull shot off, so that if he were to lean forward, the brains would fall out. Another in half-delirium, despite my controlling efforts, tore off the dressing of his wound even to the lint, that he might show me the gash and rot in his hip where the minnieball was still buried. A poor young "reb" aroused my special sympathies. He was evidently unused to suffering. He complained of everything. He could not drink tea, and did not know what the soup was made of. (At the moment, I saw him fishing up a large shred of chicken from his bonilli.) His ankle had been shot through and through, and he was awaiting amputation, only doubting how far up it would take place. I asked him what he would like, and he said "Almost anything, but I can't drink tea." I thought of my boy, but I saw a thousand: What can I tell you of them all? The case that horrified me most was that of a Georgia captain. He lay as placid as the dead. His left eye was shot away. Dr. Smith told me that the poor fellow had actually torn out the ball from the wound with his own hand. Now he was lying so still that the surgeon began by trying if life yet lingered, but when the hands engaged in removing the bandages approached the wound, the speechless mass of flesh writhed and agonized unutterably. I pressed forward to hold his hands, but I was obliged to yield my place to one more accustomed to the horrors of war. The patient has since died in tortures of locked-jaw, grinding curses and blasphemies from his clenched teeth.

I interrupted my letter to visit the hospital again, and offer to God's representatives the little service within my power. "In-

asmuch as ye have done it unto the least of these, ye have done it unto Me."

The last hour has been spent in a mission yet sadder, if possible. A young man is to be hanged here tomorrow, and I have just left his cell. His crime is the murder of a woman and child. You may well believe that it roused strong emotions in me to find myself talking with a being in perfect health, whose death at a fixed hour tomorrow is as certain as any event of human ordering. He seems about 22, is about 5'5" tall, is very well-knit and talks freely. His eye is dark brown, his mouth cool and firm, but not vicious; his whole face is colorless though full and is overspread with an expression of coldness. I don't think he has ever known how to cry. His hand is cold, and so are the lips which I pressed at leaving him. God pity him! He asked me to be with him tomorrow, but our Fathers, through whose efforts he has become a Catholic, will attend him. Within a day he will be thrust into eternity. May God give him strength and consolation to the end.⁵

Gettysburg

This battle lasted over three days (July 1-3, 1863) with a total of 43,500 casualties. As at Sharpsburg, the Confederates retreated, leaving their dead and wounded in their own or Union hospitals.

The story of the wounding and evacuation of a member of the 2nd Maryland Infantry gives a vivid picture of the evacuation of the Confederate wounded from Gettysburg. John Goldsborough White from Talbot County wrote these reminiscences some 60 years after the battle, using his diary as a basis. This abstract starts July 2nd, the second day of the Battle of Gettysburg:⁶

Calm Before the Storm

I slept like a log. We were out in the open field, and I can remember that we boys felt that we got more fresh air, and had a more comfortable night than the fellows who had gone into the cover of the woods. July 2nd, the sun rose clear and bright, but in a short time there seemed to come a dark cloud over the sun. I can remember how the cloud over the sun (it must have been smoke from the first day's battle) gave the Confederate division flag the appearance of having been all smoked up and dipped in blood. Then it cleared up and the sun was shining again. All was very quiet, each side facing the other, and thinking of what was to come.

Before eight o'clock the skirmishers had gotten into action, and cannon from both sides, the enemy on the slopes of Culp's Hill and our cannon on the elevations beyond us, to the left of where we lay waiting. All the forenoon and until three in the afternoon, we lay there, as near as possible under cover, watching the artillery in action on our side of Cemetery Ridge, and witnessing the fearful explosion of shells which Gen. Lee was directing into the enemy ranks from around on the other side of the enemy position.

At three o'clock in the afternoon, the order came for us to go forward. As far as we could see through the smoke, Stewart's Brigade moved forward as though on dress parade. Only for a little way, however, for soon we could hear the zip, zip and the whiz of the minnies; as they passed us we could detect it in the air. The first boy I saw struck was only a few feet from me. I know that he must have been killed outright. For all these years I have tried to locate in my mind who he was, but the excitement of the moment simply swept details of persons and incidents aside, and all that we could see was simply that we had to keep going at the enemy's position.

Officers Dismount

We knew that the enemy were giving ground, and that we were getting possession of the advantageous position that they had held in the woods and that we were driving them back across Rock Creek. An hour before sunset, we were at Rock Creek; it must have taken us considerable time to get across. It was not yet sunset when our line was formed on the enemy side of the

creek. The whole regimental staff of officers dismounted, and on foot with the common soldiers, Lt. Col. James R. Herbert, with two pistols strapped about his waist and waving his sword, took a position about 10 yards in advance of the line. All officers' mounts were sent to the rear, and we started on again.

We moved a considerable distance, the shells and the Minnies coming thick and fast. I can remember that we began the ascent of a very rough and timbered sort of little mountainside and that there were no end of huge projecting rocks, very steep in places. Jim Dorsey and I were out in the open, where we both halted for the purpose of reloading; we tore the paper on our cartridges with our teeth: He cried out to me, "Did not that ball strike you?" I don't know what I said, but I did not move. When I did move, down I went in a heap on the ground. It did not hurt a bit; just seemed to deaden the foot and leg. Then I remember Dorsey saying, "You had better get away from here, and try and get back." I told him to "Go on," that I "Couldn't move." For some time I lay there nursing the leg; it was well after darkness when litter bearers got me across Rock Creek.

Used Gun as Crutch

Many badly-wounded were being brought across the creek. I remember that I brought my musket along with me on the litter, and that I told the fellows there on the bank of the creek that I thought I could make it further back using the gun as a crutch. It must have been near midnight when I hobbled into the field hospital. Lanterns were burning, and I sat down on the ground and got my shoe off. The bullet had entered my foot directly on top of the instep. My foot was so saturated with blood that I did not know whether the bullet had passed out of the bottom of my shoe. The doctor wanted to know "If the bullet was still in there?" I told him that "I did not think it was." He ran an instrument into the wound and shook the bullet around among the crushed bones of the foot, and wanted to know if I wanted "A drink of whisky." My reply was "For him to go ahead—that I wanted to see what he was going to do." I can remember the slashing open of the flesh, and then the forceps pulling loose the bullet from the wedged-in location in the bone of the instep; the most fearful pain that I have ever known.

I lay on the ground outside the hospital tent the few remaining hours of the night. With daylight, I remember that the first man I saw of my acquaintance was poor old Tom Edgar, my boyhood friend and childhood acquaintance from Talbot County, a member of our company. He was just alive. I hobbled over to where he lay and took his head in my lap and asked him how he felt. He told me that the surgeon had told him that he could not live. He did not seem to be in pain. The ball had gone into his left side and pierced one of his lungs or some vital spot. Soon Bill Hardcastle (one of the boys who had come from Talbot County with me) came along. He had brought in some of the badly wounded.

Death Tolls High

I asked Hardcastle what he knew of the regiment, how it had come out in the matter of casualties, and he replied that the 2nd Maryland was almost wiped out; that Col. Herbert was fearfully wounded, shot three times; that Maj. Goldsborough was also badly wounded, pierced by two bullets, and with tears streaming down his face, he said that Capt. William H. Murray, of Company A had been killed outright. All of the right of Murray's company and the left of ours (Company C) were killed or wounded.

I wanted to know of Hardcastle as to where the remnant of the regiment was at this time (it must have been around 9 AM). He seemed surprised in my not knowing what had happened, and pointed in the direction of the brow of Cemetery Ridge and Culp's Hill, exclaiming, "They are up there, we drove them out and are holding the position; the whole of Johnson's division is up there, what's left of it." Later I was to know that the 2nd Maryland Infantry had carried 500 men into action, and that over 300 of us had been either killed or wounded.

Wounded Removed

While the fearful noise of the artillery duel taking place on the other side of Cemetery Ridge was at its worst, all of our

wounded were removed further back. I remember that I was half lifted and half assisted myself into a covered Army wagon, where others much worse off than myself were lying or seated on the floor. I have a decided recollection of Col. Bradley T. Johnson being present and assisting in the arrangements for getting the wounded away from the field hospital. He had arrived on the field of battle about 10 o'clock that morning, having left Richmond a few days prior to the Battle of Gettysburg and ridden all the way on horseback from Charlottesville, hoping that he would be with the 2nd Maryland before the two armies would clash. From this time on, he was to be in active command of that Division, or remnant of Maryland troops, known in Civil War history as the Maryland Line. Later, he was to be advanced to Brigadier General.

I have a distinct recollection of the quiet which prevailed when the artillery fire ceased just preceding Pickett's charge. The Army wagons had removed us to some small crossroads village, and all of us knew what the pause in the artillery fire meant—that Gen. Lee was sending his infantry against the opposite side of Cemetery Ridge.

When night came on, we sensed that the attempt to crush the enemy had not been a success. The wounded were again loaded into the wagons and a long train of Army ambulances started in the direction of the town of Gettysburg. I can remember how surprised we were that the enemy were nowhere in evidence and that no interference was made in our going or proceeding in the complete half-circle which it was necessary for us to make in reaching the rear of Gen. Lee's position. I have been upon the roads we traveled that night since the close of the war and from what I would judge, we were carried a distance of over 10 miles and the better part of the remnants of Gen. Ewell's Corps covered that distance in the line of retreat through Gettysburg and on to the rear of the main Southern Army. This I have always thought one of the greatest accomplishments of the Civil War. The failure of the enemy to interfere with our line of retreat completely around their entire left was the best indication of the demoralized condition of Gen. Meade's Army.

Swollen River Barrier

The wagon procession in which I was traveling made no stop until we arrived at Williamsport, on the Potomac River. I can remember that, counting the night we started, until we reached the river, we were two nights and one day on the road. When we got to the Potomac, it was so high from heavy rains that it was out of the question our attempting to cross. Where we stopped, the river banks were very high; our wagons halted on the very brink of the steep, rough river side. The driver of our wagon was a husky, good-hearted North Carolinian, and soon after our arrival at the river bank, he suggested that those of us who were able to crawl around get out of the wagon and seek safety under the brink of the river bank, where we would be protected from the cannon fire of the enemy. The driver used his wagon shovel to dig me a sort of pocket under the bank, which was my bunk and living quarters for almost a full week, as we lay there watching the rushing, muddy waters of the Potomac gradually fall.

While there on the river bank, I got a pencil and some paper and wrote a letter to my mother, telling her that I was still alive, and that from reports I had gotten we believed Maj. Goldsborough would live. I told her of Capt. Murray's death and of poor old Tom Edgar dying with his head resting in my lap. This letter my North Carolina friend left with some of the citizens of the community where we were halted, and when the war was over years later, I saw it in my home in Talbot County.

Aided Across River

Before the river had fallen sufficiently for the wagons to cross, the mounted soldiers were swimming their horses over to the other bank, and a ferry boat was in operation, which carried many of the wounded over. A cavalryman suggested one morning that he boost me onto his horse so that I could ride to the boat. I got across safely, and in about a half-hour the cavalry soldier got across and assisted me in dismounting. A fierce artillery battle was going on the morning that I got across the river, and

the shells were bursting in all directions, our position on the southern side of the river being much more exposed to the fire than we had been under the bank on the enemy side.

I can remember that the wagons got us into Martinsburg on a bright Sunday morning. There must have been some in the line of march whose spirits were still unbroken, or it may have been that the bands with the infantry divisions wished to cheer up the wounded, as the bands were playing "Carry Me Back to Old Virginny" when we got into town that morning. My foot had not been dressed or treated by a doctor since the night of July 2nd, and was as black as a hat. I had it dressed at Martinsburg, and was given a pair of crutches. Bob Clough, one of the boys who had tramped with me from Talbot County to Richmond, arrived in Martinsburg while I was there. He was badly shot in his left arm. From Martinsburg we were sent to Lee Town in Jefferson County, VA, where we were kept for several days.

While at Martinsburg, I ran onto my haversack with the Yankee shirt and underclothes change which I had grabbed off when we licked Milroy, and was able to make a full change. Believe me, the change was needed, as I had been wearing the same clothes since we had marched away from Winchester on our way to Pennsylvania! The old clothes, dirty, black from the mud and the grime of battle, were thrown away.

Aided by Farmer

A farmer living in the vicinity of Lee Town (I have wished so many times that I could remember his name), volunteered to use his farm wagon for conveying a bunch of us wounded to some point further south. We started on our ride, winding up 150 miles away, at Staunton. A long ride over the old Valley pike, a ride which comes up fresh in my memory over all these past 60 years or more. We were about a week in making the trip.

At Staunton, arrangements were ready for our transfer by railroad to a Richmond hospital. I remember when we got to Charlottesville that one of our wounded was insistent that I leave the train there and go with him to his home near by, but the officer in charge of us objected to my doing so, and, on the first day of August, 1863, I found myself in Chimborazo Hospital, in Richmond.

One of the surgeons in charge was a fine young fellow from Georgia, named Carlton, and another, Dr. Washington, a Virginian, who had been stationed at St. Timothy's School when I was there, and a third surgeon was Dr. Bowen, a fine old gentleman. He was from near Manassas, VA, and since I have made my home in Prince William County, VA, I have come to know of the fine qualities of that old gentleman. Dr. Bowen often brought his pretty daughter with him to visit us while we were in the hospital.

In Critical Shape

My foot was in a fearful condition. The surgeons informed me that I was lucky to be alive after having gone so long without proper treatment, the crushed and broken bones of the arch of my foot. Broken and smashed pieces of bone worked gradually out of the surface. I tried to save each piece of bone, with the bullet, which the doctor had given me at Gettysburg. I had them tied up in a handkerchief and think I managed to hold on to them until I lost the whole outfit in the Cold Harbor fight in 1864. Dr. Carlton put me in a tent out in the yard of the hospital, and the open air quarters did me good. I remember that I stayed in the tent until the cold weather had set in.

White's account of his wounding and evacuation shows the total inadequacy of the Confederate ambulance, evacuation and hospital system.

Gettysburg: Dispersal of the Wounded

The major problem in dispersing the wounded following the Battle of Gettysburg was interference with railroad transportation. Railroad bridges were knocked out by Rebel raids, after these were rebuilt, some were washed away by floods. Patients were sent by train to New York, Baltimore and York. Every train of wound-

ed was placed in the charge of a medical officer, who was given instruments, dressings and stimulants. Each car was filled with a sufficient quantity of hay, water coolers, tin cups, bedpans and urinals. The Sanitary Commission was very helpful in feeding and attending the patients. "At Baltimore, the agents of several benevolent societies distributed food bountifully to the wounded in the cars immediately on their arrival."⁴

There is a charming account of the vicissitude of the people of Carroll County during the Civil War, drawn from personal reminiscences and newspaper accounts.⁷ During and following Gettysburg (July 1-3, 1863), the wounded of both armies drifted south through Westminster. A hospital was set up in the old Union Church, and wounded were evacuated by the Western Maryland Railroad to Baltimore. Many wounded were taken into private homes. Members of the Adams Express Company of Baltimore organized a volunteer hospital corps with proper supplies, men and spring wagons to bring out the wounded. The local coffin-makers were put to work and the dead were buried in local cemeteries. On one occasion (the skirmish of June 29, 1863 at Westminster) two Union soldiers and two Confederates were killed and buried from Ascension Church at Westminster. The two Union men were buried together in the same grave, as were the two Confederates.

Monocacy

Like the other two invasions of Maryland (Sharpsburg, 1862 and Gettysburg, 1863), Jubal Early's invasion in June and July of 1864 was a daring gamble that the presence of Confederate troops in the heartland of the Union could bring the North to sue for peace. An additional purpose was to draw Union troops from Richmond to defend Washington, and thereby lessen the pressure on Lee's Army of Northern Virginia.

Early, having defeated Hunter near Lynchburg, rapidly advanced up the Shenandoah Valley, (June 27-July 4, 1864), crossed the Potomac at Shepherdstown (July 5th) and advanced eastward. On July 9th, a hastily-gathered Union Army of 5,850 men met Early's army of about 15,000 on Monocacy Creek, just south of Frederick. Although eventually overwhelmed, Wallace's Union forces delayed Early and further exhausted his army. Two days later, Early's tired army reached the northwest outskirts of Washington. By this time, new Federal troops were streaming into Washington at the other end of the city, and Early subsequently retired.

At the battle on July 9th, the Federal losses were 130 killed and 560 wounded; the Confederate losses were 250 killed and 650 wounded. Several days later, 435 of the Confederate wounded were in country houses or Frederick hospitals when Federal cavalry reoccupied Frederick.

The major part of the battle took place on the Worthington Farm. During the battle, the family took refuge in the cellar. Glenn Worthington, then a young boy, wrote of the wounded:⁸

"After the battle, the dead and many wounded lay over fields where, as soldiers militant, they fought and fell. There were dead and wounded on the Worthington farm, in the cornfield, in the pasture field, in the wheatfield and in the yard and gar-

den; and on the Thomas farm in almost every field as well as about his house, yard and premises; down by Gambrell's Mill, there were others who gave their lives or suffered grievous wounds, fighting for the cause they deemed to be just.

"Where the peaceful harvesters had, but a few days before, cut and gathered into stacks the ripened grain, there on this day was the harvest of death and the blood of heroes on both sides stained the stubble and the straw of the bound grain, and the bodies of the dead and wounded were mingled with the scattered sheaves.

"In some fields, the dry wheat stubble caught fire and burned over wide areas, threatening to envelop the helpless wounded who lay there, but friendly hands with blankets beat out the spreading flames. One wounded Rebel stated that a Yankee beat out the flames close to him and thus saved him from the torture of being burned to death. A wounded and helpless foe is no longer an enemy. Such deeds of mercy and humanity are not infrequent in war, it is said, thanks to our better nature and Christian nurture.

"One who was in the battle thus writes:⁸

'I pass a comrade sitting by the roadside. Blood is trickling from a wound just below the heart . . . I say, "Goodbye," to him; there is no regret or fear in his tone as he replies. A brave country boy he had lived, and death has no terrors for him. He could not have smiled more sweetly had he been lying down to pleasant dreams.'

'Hours afterward, I carry a canteen full of water to another comrade lying on a pile of grain in the storehouse by the railroad, and he, too, had no complaints or repinings. He only said, "I have my death wound," and with the dew of youth yet fresh upon him, with all the prospects of a long life ended, he closed his eyes in dreamless sleep.'

"After the battle, dead and wounded lay around and about the Worthington house, some wounded screaming with pain, some groaning in agony, others enduring silently. One large Confederate lay bleeding in the backyard, in the angle made by the wings of the house. He was shot several times and was mortally wounded. He died within the hour. Mrs. Worthington spoke to him shortly before his death and inquired, and he replied saying that he had a wife and children at home.

"Another, a soldier in blue, had a bullet wound in his body that caused him to bleed internally. His abdomen was discolored from the internal hemorrhage. He was propped against a tree in the front yard of the Worthington House, and his groans were pitiable. A Confederate surgeon at Mr. Worthington's request gave him morphia to deaden his pain. He died during the night. Many others were brought in on stretchers, some to be treated, some to be buried. Hospitals were also established at the McKinney home, at the Thomas house, at Gambrell's Mill and along the highway near the Yaste house; and so they died, the young and the old, on the field amidst the roar of cannon and musketry, in the hospitals of wounds, on the picket line, anywhere, those who wore the blue and those who wore the gray. They deemed the cause worthy the sacrifice. God give them rest and a rich reward."

Military Hospitals in Maryland

In September, 1861, W. A. Hammond established the National Hospital in Baltimore. Located conveniently near the B. and O. Depot, 600 yards from the harbor, it consisted of a large piano factory and 11 dwellings on both sides of Camden St. It was five stories high. There were 15 wards. The leakage of water into the cellar required continuous pumping and, because of the low ground, there was defective drainage. The buildings were all brick and were heated by furnaces, by wood fires and by open fireplaces. Ventilation was maintained by transoms. Water was supplied from street mains and distributed in lead pipes. There were 10 water closets for the whole hospital. The hospital contained 700 beds, each patient had 800 cubic feet of space. The average daily census was 450

people. A second hospital called West's Buildings, consisted of six warehouses of three stories, each of which contained 400 beds, four bathrooms and water closets. It was heated poorly by coal stoves. A third Maryland hospital was McKim's Mansion in Baltimore. This was originally a barracks built around the McKim Mansion for temporary shelter for troops. It had a poor water supply, was poorly-constructed and had no water closet.

Patterson Park Hospital in Baltimore was another hospital converted from barracks in April, 1862. There were 17 wards with 426 beds.

The Hammond Hospital at Point Lookout, MD between the Chesapeake Bay and Potomac River was located on a low, narrow peninsula, a former summer hotel. It was difficult for steamers to dock. It was in an isolated area. In 1862, a plan for a special building on the pavilion system was started, but was incomplete by May, 1863.

Probably the best-constructed Union hospital during the war was the Hick's Hospital in Baltimore, opened in January, 1865 in the western section of the city, but the war ended before it was completed.

The Jarvis General Hospital was the largest of six hospitals in Baltimore. It had 1,500 beds and was built on the property of Maj. Gen. George H. Stuart between Mount and Monroe Sts. on West Baltimore St. It was opened June 20, 1862.

George Perkins, in his book *A Summer in Maryland and Virginia*, tells us what happened to patients when they arrived at a hospital. He arrived at the Tent Hospital in Annapolis in 1864. All clothes were taken and burned, then each patient had a close haircut, a hose was turned on each person and a good scrubbing was administered and nightgowns were issued.

We have an interesting description of life in the Jarvis General Hospital during 1863 and 1864.⁹ Mrs. Sarah S. Spear of Baltimore volunteered to work at the hospital. She notes that it had a good view of the harbor and horsecars passed within a few yards from its doors.

On July 22, 1863, she notes that since Gettysburg, two or three patients died daily in the Hospital. She was Officer of the Day for volunteers and distributed dinners and suppers for those not able to get to the dining room. There were about a thousand patients of whom about one half went to the dining room. One large section was filled with Confederate wounded. Funeral services were held under the trees. A service was read, one hymn was sung and one prayer was said.

Mrs. Spear participated in entertainment for the soldiers. She wrote letters for them to their families. She sung in a quartet, songs such as *Just Before the Battle, Mother and Who Will Care for Mother Now?* She washed out the Chapel every Saturday and played the melodium for the services. She notes that the patients preferred military titles in their reading. Books such as *Masked Batteries, A Greater Rebellion, Halt, The Grand Army* and poems such as *The Rainy Day in Camp* were very popular.

Planned for the Medical Professional

• **NEW AND ESTABLISHED PHYSICIANS**

are invited to practice in a large and rapidly growing community convenient to 2 hospitals in Anne Arundel County.

• **BUY, APPRECIATE, GROW (Why Rent?)**

Specialities limited.

* **PRIME LOCATION**

* **EXCELLENT FINANCING**

* **IMMEDIATE AVAILABILITY**

* **AMPLE PARKING**

* **UNITS FROM 960 SQ. FT.**

TALK TO STEFFEY Realtors since 1915

In the extra diet kitchen, special jellies, tobacco and ginger bread were available.

Jarvis General was closed as a hospital Aug. 26, 1865; 17,000 patients had gone through the hospital.

Early in the war, soldiers were discharged without adequate planning. A letter from President Abraham Lincoln in October, 1862 follows:

"A Baltimore Committee called on me this morning, saying that the City is full of straggling soldiers, half sick, half well, who profess to have been turned from the hospital with no definite directions where to go. Is this true? Are men turned from the hospitals not knowing where to go? A. Lincoln."

A number of attempts had been made to start convalescent camps to permit patients not requiring hospitalization to recover. One was in Alexandria, Virginia and one on David's Island, NY. They were known as military depots and were used for stragglers, convalescents and nondescripts of all kinds.

In addition to the Army hospitals in Baltimore during the Civil War, the University Hospital was also used for wounded Union soldiers. The hospital made a profit on the soldiers in that they charged \$5. per week for a soldier, but only \$3. a week for a private patient. Although it was notorious that the sympathies of the Medical Faculty were blatantly Southern, their treatment of Union soldiers won high commendations from the Federal government.

V-Cillin K[®]

penicillin V potassium

is the most
widely prescribed
brand of oral penicillin

Tablets
125, 250, and 500 mg*
Oral Solution
125 and 250 mg*/5 ml

V-Cillin K[®] penicillin V potassium

Description: V-Cillin K is the potassium salt of penicillin V. This chemically improved form combines acid stability with immediate solubility and rapid absorption.

Indications: For the treatment of mild to moderately severe pneumococcal respiratory tract infections and mild staphylococcal skin and soft-tissue infections that are sensitive to penicillin G. See the package literature for other indications.

Contraindication: Previous hypersensitivity to penicillin.

Warnings: Serious, occasionally fatal, anaphylactoid reactions have been reported. Some patients with penicillin hypersensitivity have had severe reactions to a cephalosporin; inquire about penicillin, cephalosporin, or other allergies

before treatment. If an allergic reaction occurs, discontinue the drug and treat with the usual agents (e.g., epinephrine or other pressor amines, antihistamines, or corticosteroids).

Precautions: Use with caution in individuals with histories of significant allergies and/or asthma. Do not rely on oral administration in patients with severe illness, nausea, vomiting, gastric dilatation, cardiospasm, or intestinal hypermotility. Occasional patients will not absorb therapeutic amounts given orally. In streptococcal infections, treat until the organism is eliminated (minimum of ten days). With prolonged use, nonsusceptible organisms, including fungi, may overgrow; treat superinfection appropriately.

Adverse Reactions: Hypersensitivity, including fatal anaphylaxis. Nausea, vomiting, epigastric distress, diarrhea, and black, hairy tongue. Skin eruptions, urticaria, reactions resembling serum sickness (including chills, edema, arthralgia, prostration), laryngeal edema, fever, and eosinophilia. Infrequent hemolytic anemia, leukopenia, thrombocytopenia, neuropathy, and nephropathy, usually with high doses of parenteral penicillin.

Medical Hypnosis Versus Hypnotism: What They ARE—and What They Are NOT An Exclusive JOURNAL Interview With Edward O. Hunt, Jr., MD, PA

By BLAINE TAYLOR

Contact Mr. Taylor, JOURNAL Managing Editor, for reprint and other data to the JOURNAL, 1211 Cathedral St., Baltimore, MD 21201.

Hypnosis vs. Hypnotism

Dr. Edward O. Hunt, Jr., 42, has had, since 1968, a private practice of general and vascular surgery in Baltimore. Named Chief Physician of the Baltimore City Fire Department in 1978, the tall, muscular, friendly, mild-mannered and soft-spoken physician is also one of only four Board-Certified Medical Hypnotists in the Baltimore metropolitan area. As a diplomate of the American Board of Medical Hypnosis, (he was elected in 1978 to its Board of Directors also) which—as he was at pains to point out again and again during this exclusive JOURNAL interview conducted on May 7, 1979 in his Garwyn Medical Center office (where he maintains what he believes is one of the area's first, non-group, computerized practices)—is not the same as a word he sparages: "hypnotism."

Born Apr. 6, 1937, the Baltimore native graduated from Dunbar High School in 1954 and Capital University in Columbus, OH four years later. After graduating from the University of Maryland Medical School (where he was only the eighth black admitted) in 1962, Dr. Hunt went a one-year Internship, and a Surgical Residency the following year, at Sinai Hospital.

Between 1964-67, he served a Surgical Residency at the Veterans Administration Hospital at Perry Point, MD, followed by a Chief Surgical Residency stint at Baltimore's VA Hospital. His current hospital affiliations include Provident, Union Memorial, Maryland General, Lutheran and North Charles General, all Baltimore.

After the death of his uncle, Dr. Richard Hunt, Dr. Edward Hunt became Principal Physician of two nursing homes in Glen Burnie, MD. Subsequently, he assumed Medical Directorships of nursing homes both there and in Baltimore. As a result of his involvement in long-term care, he became affiliated with the American Association of Nursing Home Physicians, and, in 1977, he was elected President of this Association.

In 1972, Dr. Hunt was accepted into Fellowship in the American College of Surgeons. He has been a member of numerous professional organizations, including the American College of Surgeons, the Monumental City Medical Society, the National Medical Society, the Baltimore City Medical Society and the American Society of Clinical Hypnosis. Dr. Hunt joined Med-Chi in 1970, where he served as a two-year member of the Emergency Services Committee.

During 1974-76, Dr. Hunt was President of the black ME-DE-SO (Medical-Dental Society) club. Between 1973-77, he was elected as a member of the Maryland Commission for Nursing, and was its Vice Chairman for two years.

He was chosen as a Fire Department physician in 1972, and is presently completing his third term as Secretary of the Baltimore City Professional Standards Review Organization (PSRO).

His published papers include *Awareness Under Anesthesia, Investigation of an Adult Duplexic Using Hypnosis* and others. A member of the YMCA, NAACP and other civic groups, Dr. Hunt and his wife, Ruth Brooks Hunt, have three children: Susan, 17 and twins

Mark and Monica, 14. Dr. Hunt's hobby is making model airplanes, ships and cars.

His active clinical interest in hypnosis began nine years ago. Since 1970, Dr. Hunt has attended numerous workshops and scientific and training sessions in the field of medical hypnosis, both as student and lecturer, and discussed at length with the JOURNAL—in his calm, patient and soothing voice—what he considers an important and growing (if rather unknown) area of medical practice today and in the future.

Introduction

What IS medical hypnotism? How many people practice it in the country? I want to try to give our readership a perspective concerning the scope of the subject.

Well, I try to be very careful with semantics in hypnosis and try not to use the word "hypnotism," because the word hypnotism invites thoughts of the occult, so I strictly say "medical hypnosis" instead.

Is hypnosis DIFFERENT from hypnotism?

Not really. They're two words that mean the same thing, historically. As for professional hypnosis societies—there are two in the country that're limited to MDs and PhDs—the first, the American Society of Clinical Hypnosis, has approximately 4,000 active members, while the second, the Society for Clinical and Experimental Hypnosis, has about 2,000.

What about the people who DON'T belong to EITHER of those two groups, but who're still in the field?

There are some people who have some training in hypnosis who don't belong to either Societies; however, in these Societies, we're carefully trying to keep hypnosis professional, therefore, we don't want to include professions that're not medically-oriented. There are some MDs and PhDs who don't belong to the groups I've mentioned, but who do belong to other groups that have professionals who aren't medical professionals.

I'm very careful to make this distinction because you can find some people—like a group which recently came to Bal-

DR. HUNT

further from Washington—to have weight-loss classes with hypnosis, and which, inadvertently, may encourage fadism.

Were they Mds or PhDs?

As far as I know, they weren't. Being non-professional in that way sort of degrades the aspect of hypnosis that we're interested in—and that's the part that's strictly used not for show, but only for professional purposes.

Is there that great a difference between the two?

If you're doing hypnosis on an individual, the hypnosis that is done for show, or religious purposes or weight-loss is the same; however, the difference for us is we feel that hypnosis is something that should be used as a part of the general medical treatment of an individual. Therefore, it's **not** used for show, and hardly ever do you see one of us in the professional societies giving demonstrations or other things that would present the showy, or "stage" aspect of hypnosis.

Weight-Loss and Control

CAN hypnosis be used in weight-loss or weight-control?

Yes.

Does it force the person to stop eating?

No.

How DOES it work?

There're different techniques. The one we like the least is the aversive technique, where you say "If you eat a potato, you'll have nausea and vomiting." What we'd prefer is a technique where suggestions are made that you really want to protect your body and you **are** your body's keeper. We like to get these suggestions to take hold in the person. Along with these suggestions are others of proper eating and diet if necessary. A successful individual will lose weight very well.

Over how long a period of time?

It varies. I suggest between two-four pounds a month.

New Laws Needed?

How do you stop, say, an unscrupulous weight-loss practitioner?

You can't.

There's **NO** way to protect the public?

No.

How does the law stop them?

It does not. We have, in some states, been trying very hard to get the laws changed, to have people who use hypnosis on medical conditions be physicians or psychologists or dentists. Those laws aren't available in some states.

What about in Maryland?

No.

Do you think they **SHOULD BE**, and would you recommend going to the General Assembly in Annapolis in January, 1980 when the next State legislative session opens proposing that something be put on the books?

Yes. Something **should** be done.

Is there, in your view, widespread abuse of medical hypnosis?

No, not in Maryland, but there is in some other states, such as California and Oregon. A number of the stage hypnotists seem to be there. I don't mind the stage hypnotists, as long as they don't suggest that what they're doing is useful medically. On the other hand, they've really given hypnosis a bad name!

Origins

Historically, how far back does medical hypnosis date?

Essentially from Franz Anton Mesmer, who lived during 1734-1815 in France.

Hypnosis Within the Medical Community

Do MDs who don't use hypnosis at all recognize it as a valid modality of medical treatment? Do they see it as viable and bonafide, or is it controversial?

All physicians don't have enough understanding of the basis and uses of hypnosis to be able to make such a distinction; however, the professional societies have been evaluated and reviewed by the AMA, the American Psychological Association and the American Dental Association. The medical, dental and psychological uses of hypnosis have been evaluated and accepted by all three, as does Med-Chi locally.

But **IS** it a controversial treatment mode, like acupuncture, that's still being debated?

I would feel that there are some in medical circles who aren't knowledgeable about hypnosis who **would** want to debate it, but those who've had input into it—either by training or exposure through professional use—acknowledge the fact that it is a bonafide adjunct to a patient's treatment.

How did you, personally, get into it and why?

I became interested in it during my third week of medical school at the University of Maryland in 1958, when my Professor of Psychiatry, Dr. Ephraim Lisansky, demonstrated its usefulness with some of the patients.

Does one get an extra degree to practice this? How does one become recognized as skilled in this area by his/her peers?

The training cycle that I went through was 1) beginning courses in medical hypnosis under the auspices of the American Society of Medical Hypnosis, followed by 2) advanced courses. 3) Then, I took the board examination. Later, I was asked to be a member of the Board.

Are the courses mostly demonstrative, wherein you're taught how to actually perform medical hypnosis?

That's correct. After you've taken the courses, you apply to the Society for membership and—after you've demon-

strated a certain amount of expertise—you move up to fellowship; the Board exams come after that.

What did the exam consist of? What **KINDS** of questions were there? What did you have to demonstrate?

The exam consisted of a written portion including multiple choice and essays. Then you had to sit before a committee and answer questions. Afterwards, you had to give a demonstration of your ability in hypnosis and had to present two recordings of case reports that you'd done plus being prepared to answer questions concerning them.

Is there any such thing as licensure in the medical hypnosis field?

No. People are recognized as bonafide practitioners by taking the courses and examinations I mentioned earlier.

Fees

Is there any kind of a fee schedule set-up for your services?

Yes. Hourly is best and, at present, I'm charging \$50 for an hour. This is a fairly standard fee, although a lot of people charge more.

Who determines what the standard and customary fees are?

The determination is usually made by the individual, based on the same hourly rate he or she would charge otherwise for consultative services.

Rasputin and the Tsarevitch

Are you familiar with the case of the Russian monk Rasputin and the Romanov Dynasty?

Yes.

There've been two rather good films made of this case history—the 1932 picture **RASPUTIN AND THE EMPRESS** and the 1967 remake from the book of the same title, **NICHOLAS AND ALEXANDRA**. In both of these films, Rasputin is pictured as hypnotizing the Russian heir to the throne, the Tsarevitch Alexei. Do you think those were accurate portrayals of what the monk actually did? Did he stop the Tsarevitch's hemophilia?

No.

I guess it's unfair to ask: What **DID** stop it? Supposedly, it **DID** work. It's shown the way I've described. Is it possible?

It is possible. It has been done in hemophiliacs to reduce the number of episodes of bleeding.

Is there a connection, then, between how the mind thinks and the body functions?

Yes, that's correct; however, you can't take one or two cases and say you can do it in every case. It will **not** be successful in every case. What some of the hematologist members of the Society are trying to do now is to define some laboratory parameters that would justify the occurrence, and that's something hard to do.

When Rasputin stopped the bleeding in the years before the Russian Revolution in 1917, it was considered a miracle. Is that kind of treatment given today?

Yes.

In large numbers?
